Yes, the term projection can be convoluted, though the way I use it has changed from the past, so when I use it now I mean "you're seeing your own choice", basically.

Right. The issue with "projection" is that it tends to imply a sort of mechanism which occurs within time and space. But what you mean is clear enough. Using a different metaphor, then, we might say that "seeing your own choice" is the "sensory aspect" of your current state - which one might consider as the total sum of all deliberate and non-deliberate intentional patterns and their implications to date, and which fully defines all moments. Your state or world-pattern is itself non-local and non-temporal, implicitly specifies all locations and moments. In this scheme, "projection" would be "intentional change of your state and subsequently encountering the effects in your ongoing experience".

I've been paying extra attention in my dealings with "other people" lately and I have been able to really see the lack of separation between experiencing and the seeming appearance of others, so I now view these interactions as less real which helps to examine exactly what I'm patterning.

I wouldn't say that they are "less real" though. The only thing that was ever real was your ongoing patterned experience, and the only way in which you ever encountered people was as a part of that experience. It's simply that your story about that experience has changed. The description has changed, but the nature of the experience is unchanged from what it was before. However, by attending to your experience you can directly notice that it is all "made from you" - that is, that you are and always were the entire moment of any particular scene or encounter. And although the scene is structured as apparently being from a certain perspective - you-as-person are apparently "over here" and your friend is "over there" - you notice that the whole thing, both "over here" and "over there" and everywhere else, is in fact "made from" you. So you are everywhere and nowhere; it is all actually you-as-awareness in the "shape" of the scene.

I have a twin brother and it's harder to see his lack of independent existence due to our history...

That experience of identity and history - that meaningful felt-sense - that accompanies experiences of your twin, is itself experiential content. You can actually locate it somewhat within experience usually (it may be in your lower abdomen area, or in your chest). It's something to play with, anyway, the meaning that comes with the other aspects of a scene or moment.

When I look in the mirror lately, it is more like I am looking at a dream, so whatever I'm looking at isn't as solid as I thought before.

The key here, I think, is to notice that the image is "over there", and then to direct your attention to "the place your are looking out from" and see what's there. Ultimately, you probably first get the sense that the mirror isn't a reflection of you, it's part of the visual scene, and that in the other direction is a sort of void (not a space, usually). Then - as with the Feeling Out Exercise in another link - you notice that the whole scene is sort of floating within perception, and you can explore beyond the boundaries of that. Your body is a bunch of sensations floating and phasing in and out; you do not experience "being a body" as such at all. (Although occasionally you may think it.) Really pay attention to the boundary between "your body" and "the room". Is there, in fact, actually a boundary? In what way are you "inside" your body at all? And so on. As you point out, one might ask whether there is a "literal person who is angry" when dealing with others. But similarly, it is worth asking if there is a "literal person who is angry" when you are having the experience of being angry. There may be a bunch of sensations, and thoughts, and so on - but if you try and locate a "you" who is angry, you'll struggle to find one.

Some people may say that if you're just experiencing your own patterns/ideas of the world, then certainly you could just go around abusing people without consequences - how accurate would you say that is?

There are always consequences, just because making a change involves corresponding consistent changes simply as part of shifting a pattern (in this metaphor). However, you could then address any unwanted outcomes as they arose, so in that sense you could do it "without consequences". Even outside of this topic, it's true you can do all sorts of bad things without suffering later, even if you do it in the everyday sense. But it's a bit like punching yourself in the face and then using magic healing cream. Why do it?

It's not something I want, I'm just curious as to if there's any limitation.

No limitation, structurally.

My view on it is that it's not possible, only because if you talk in terms of "abuse" or needing to steal from other people, then you're implying that you couldn't be given those things or you're implying that there are other people or resources outside yourself.

I think you can always handle and circumvent these implications though - that is, intentions which imply a world in which you don't get your outcome - by stepping back from them and changing the context.

Instead of stealing money and getting away with it, you would just be given money or acquire it through some other means, for example.

That does seem a better route.

Part Two

In regards to world patterns, I can see now that my previous idea of thinking that there ... is just a pattern and not something primordial; certainly having a perspective of life being amazing and jumping out of bed everyday in ecstasy isn't anything more special other than just being a different pattern.

It's "patterns all the way down", then!

Which, I we discussed earlier I think, is simply a way of saying that the only thing that is fundamentally true is the fact of "awareness" or being-aware, and absolutely everything else is relatively and temporarily true only. This doesn't just apply to facts of the world, but to the formatting of experience more generally (even "spatial extent" and "things change" and "objects" and "seeing" are patterns, just more abstract). Generally, then, one should consider that all possible patterns exist eternally, always present now in the background, and what changes is their relative prominence or intensity of contribution to ongoing experience (with a particular distribution of intensities being your "state"). So no experience is more special or fundamental than any other experience, because the fundamental aspect is common to all experiences. Being depressed is an experience, as is ecstasy. And you don't need any reason to experience one or the other, because there is no cause within experience. You experience something because it has been patterned in; that is all. Intention is the only cause, and all experiences and apparent events are results, as aspects of your current patterned state. For example, you could simply decide right now to feel joyously happy and, if you don't interfere, it'll happen. In fact, try that right now: just decide that you are going to feel really bright and happy - and then allow whatever happens to happen.

[if I am formless awareness] where does the "personal view of the universe" idea come in? For example, if I'm talking to my neighbor, is there no experience as if my neighbor is talking to me?

You could rephrase it, perhaps. If you-as-awareness has taken on the shape of a world-pattern, and in addition adopted the fact of being-this-person, then your experience will be consistent with that. Now, if you-as-awareness modified that and instead adopted the fact of being-this-neighbour, then your experience would change accordingly. What would such an experience be like? Have you already had that experience, perhaps? Or, taking this further, if all possible patterns exist eternally, what does it mean to ask whether you "have had" or "will have" the experience of apparently being-this-neighbour?

Since I never experience anyone else' perception of me, I guess this is all theory and speculation, so perhaps it isn't important, so long as "I am the one in control of everything I experience" is seen and understood clearly.

As you say, wording get tricky. Because of course, the "me" you are referring to there doesn't experience anything at all; it's just a pattern. Only you-as-awareness ever has an experience, because it is "experiencing", and so "me" is a experience, not something that experiences. So the "you in control of everything" is also, strictly speaking, an experience. You could have an experience "as if" there is a "you" who controls everything, or not. However - and this is really what you are going for here I think - the experience of apparently being "you who controls everything" is always available, potentially.

I have started to adopt the pattern of "I'm the only one in control" a lot more and it has taken a lot of responsibility that I had put outside of myself, so I suppose the pattern will continue to get stronger and I can explore more how far I can take it.

Right, it's a pattern, and the more you intend in terms of it, the more prominent it will become. And as you imply, there is no "outside of yourself" anyway, because there is no "outside" or "behind" to experiencing. If awareness is metaphorically "rippled" with patterns and there is no "granularity" to awareness, then there are no theoretical limits to what can be adopted. While one can directly notice the fact that the fundamental nature of experiencing - and of descriptions about experiencing, which are themselves just experiences - is "awareness", and even have experiences of "void" which feel like infinite potential directly, ultimately these limits (or lack thereof) are left as a matter for "personal" exploration.

Really, I'd suggest, that actually becomes an investigation of your current patterning, as every intention implies its extended pattern and results in a shift in terms of your current state - presenting a new landscape to explore. This, in fact, is why a "seeker" can never find "enlightenment" via knowledge and experiences; because the experiences never end, and they have implicitly intended by "looking" to always end up "finding" - forever. But if we consider the stuff we've been talking about about, the "meta" of all experiences, this has already been removed as an issue, and now we're just having fun.

POST: Does the number not changing mean that the jump failed?

As per the sidebar text:

Header No. 982 - Please note that a shift in your experience does not require a change in the header number, which should be treated as an emblem of change and a symbol of potential rather than an ID.

Because of course, different states of your experience aren't actually independently numbered in the form of individual dimensions each with a unique ID - so there is no necessary connection between a change in any particular fact in your ongoing experience and a change in the fact called "the number on the subreddit header".

I believe we are jumping every second anyway.

From previous discussions: I'm not sure that's a very useful way to think about it, since it seems to conflate apparent change in sensory experience (the observed seeming transition between already-determined moments which are aspects of the present state) with "jumping". It is more conceptually helpful, surely, to reserve "jumping" as a term for deliberate shifts in state, corresponding to the imposition of a particular fact or outcome. Otherwise the metaphor of "dimensions" no longer has any meaning.

Q1: The only problem I have with reserving jumping for deliberate shifts is that I think it is easier for people new to altering their experience to transition from believing that things are always shifting to making intentional jumps. It is harder to go from a completely solid reality to making big intentional changes, than to go from an ephemeral reality that is changing all the time to making intentional changes.
I don't think the metaphor of dimensions loses meaning because I conceive of dimensions as configurations of consciousness. To go from one moment to the next, from one room to another, or from one thought to the next, is to change the configuration of your consciousness. Once you realize you are consciousness that is always shifting, it is easier to conceive of making "bigger" changes. The changes are only bigger because of our belief systems, but perhaps it could be as easy to make those shifts as to shift from one mental state to another.

I do see the reasoning behind the statement - it conveys this idea that things are fluid and therefore it is easier to make changes. "Hey, you are 'jumping' all the time anyway!"

The problem, I feel, is that it makes it harder to reintroduce the idea of deliberate intention coherently later (and to talk about implications). Having used up "jumping" as term for any configuration change, we've lost its use as a term when specifying a particular target outcome configuration and intending it. So I'm generally inclined to separate out the following things, to help make things clearer:

- **"Moment by moment apparent change in sensory experience"**. These are not changes of state. They are aspects of the same static state, within which the full sequence of moments is defined.
- **"Shifts in state brought about non-deliberately."** This would be when we intend a change in the everyday sense, intervening to redirect of our current experience thus unwittingly implying a new set of moments. Perhaps just "going to the shop", but also "resisting the content of the current moment". We don't really intend to change the facts of the world in this case, but the worldview assumptions with which we formulate our intention, and its implications, bring about a state change. (We aren't really aware that we are intending here, as such.)
- **"Shifts in state brought about deliberately."** This is when we conceive of a change we'd like in our ongoing experience - facts of the world, target outcomes, whatever - and knowingly intend that change. This would be "jumping". (This is full awareness of making a change, and deliberately using the formulation of "dimensions" when specifying that change, knowingly going beyond the usual assumptions.)

I would then tend to reserve "jumping dimensions" for the final example, where we are making a deliberate change, and we are changing the actual apparent "facts of the world" - such that the results are, just as the name suggests, "as if" we had "switched into a different dimension". So instead of saying we are "jumping all the time", I would say that: our ongoing experience is in fact not as stable as we assume it to be; that this instability points to the possibility of making deliberate change; and that the concept of "dimensions" is one concept that can be used to harness this.

Q1: Those definitions make sense. I don't think that deliberate vs non-deliberate change is hard enough to understand that the word 'jumping' needs to be reserved for deliberate changes. I see the reasoning, but sometimes I just want to say "hey, you are jumping all the time!" It has a little more emphasis than shifting or instability. And it helps introduce the idea that big deliberate changes aren't necessarilly harder than what is already happening. Jumping sounds like it takes more effort than shifting or flowing, which is an idea that I don't want to introduce by reserving jumping for intentional changes. This is all pretty pedantic though.

It is pedantic, sure, but also I do think the wording we use makes a difference, and we kind of evolve the descriptions over time. So it's good to have this sort of discussion to bash it out, take on different experiences people have had when talking about this stuff. For example, linking to what you've just said, it is quite hard to convey the idea that "intending" is not actually a doing. That is, it really involves no effort or action at all, and it's not like pushing or manipulating something. In fact, any attempt to "do" an intention is really an intention of something else, and tends to conflict with the main intention (or at least place limits on the ways it can be incorporated into one's ongoing experience). This tends to be something that comes up later, though. At first, we're concentrating on the basic idea that experience is flexible, and there is a special type of "deciding" that is the true cause of change. But, then, do we sort of plan ahead for that later part of the discussion, by avoiding saying things earlier which will conflict with it, or do we just go with the approach of "oh, that was to just get you started, it's really like this"?

Realistically, it's a muddle of both. When it's a one-to-one discussion, it doesn't much matter because you are dynamically correcting things as you go along in the conversation. For one-off comments, though, I'm maybe inclined to be a bit more cautious, because we may never actually get the opportunity to make the later correction, once they've gone off to begin experiments by themselves.

Q1: Good points, I see a lot of posts where people don't really seem to understand the fluid nature of experience. "Did I jump or didn't I?", "Did it work", "I did x and nothing changed". I want to make a one-off comment to get them to consider that they are shifting all the time regardless of the outcome. I don't want anyone to walk away thinking that "dimensional jumping" doesn't work because they didn't get the outcome they wanted. I would rather have them think that they did jump, they just didn't achieve the outcome they wanted, because these things can be complicated. For better or worse, our belief systems are very complicated. Maybe I should take a little care to explain how I see things in more depth, and maybe not use the word jumping.

Yes, true about the fluidity. Beyond that, I find the main background issues that come up in posts, are:

a) not recognising the "meta" position of "experiencing" in general as distinct from any particular experience and the possibility of identifying with that (context vs content);

b) not recognising the "metaphorical" aspect of all descriptions as being "parallel experiences" (parallel constructions in thought), rather than true explanations that actually correspond to something "behind" experience;

c) not recognising that the ultimate purpose of this subreddit, being framed as an "investigation" into "the nature of experience", means that "beliefs" are something to be examined and unpacked to see how they correspond to direct experience, rather than something to simply be "respected" and applauded;

d) not recognising that just because the content of an experience corresponds to a particular description or belief, it does not mean that the description or belief is "true".

Experiences are on an "as if" basis, and many different type of description will correspond, but none of them are "behind" the experience.

Each of these tends to limit the possibility of realising (just noticing, really) how flexible one's experience might be, or limit the possibility of having collaborative discussions which might unpack hidden assumptions and help with that (while avoiding exchanges getting emotionally charged due to identification with a particular description, and so on).

POST: Not exactly sure about D jumping..

Please don't refer me to the main home posts about D jumping.

Why not? It's all there, in the linked posts from the sidebar text and sticky posts, and of course a search in the history will turn up plenty of identical questions. Anyway, /u/NomadExile has already covered the basics of the appropriate attitude below, but:

This previous comment [POST: This sub feels like what /r/lawofattraction is trying to be] highlights the difference between the /r/lawofattraction subreddit and this one, and by extension the underlying concept. See this recent reference too [POST: PSA: There is no other version of you that you're "swapping places" with - you're only changing your perception of your current reality to deal with it more effectively. Please stop worrying about some other entity being forced to live in your unwanted situation if you jump.] and some other comments around it. As implied there, the question "what exactly is it?" is in fact the investigation that the subreddit is all about. Strictly speaking, it can't be answered in words. Neither, in fact, can "what is the nature of my ongoing experience"? Which of course you'd need to answer first, before you could answer the question "what is dimensional jumping?".

Aside - If you don't know what "sticky posts" and "a sidebar" is, then you've got some work to do before posting in the subreddit. I'd generally recommend using the browser version of Reddit rather than the app for anything other than media-based subreddits, really; the app really doesn't work so well for discussion-based subreddits. If you do, you'll see the "sidebar" to the right, and the "sticky posts" clearly at the top. If you are using the app, though, there's an "info" icon somewhere in the menu which will show you the sidebar text for the subreddit you are looking at. Regardless of that, not taking the time to read the main posts before then asking questions in terms of them is a waste of everyone's time (the sidebar specifically highlights this). Basically, you really can't expect people to take time out to do the absolute basics of due diligence for you.

Q1: Hey, I got a mention!
All silliness aside, to further expand on a point, the app is ok, as long as your willing to hunt (and hunt... and hunt). I always think of using the app as exploring the dungeons in those old turn based rpgs (think Dragon Quest). There are goodies to be found, but if you use the app, it's like going in with a torch.

Not even a torch. I think it's more like:

It is dark.

inv

You have: a match.

light match

You light the match. You briefly find yourself surrounded by shadowy shapes moving in disturbing ways. The match goes out.

inv

You have: a used match; a sense of doom.

The app is okay for browsing links or brief comments and the like. It's unfortunately detrimental from a moderator perspective, though, when it comes to maintaining a subreddit based on anything more sophisticated, because casual users are left with only the subreddit name and a few recent posts to go on, with effort and luck required to get any proper context. All these sorts of subreddits now get lots more in the way of low-effort, off-topic and repeat posts as a result (a sort of relentless "intro spam") because quite a lot of users think Reddit is an app, and haven't seen the desktop/browser layout. It's not necessarily their fault, really - but it would be silly for every subreddit to also take on the role of providing Reddit 101 info.

POST: PSA: There is no other version of you that you're "swapping places" with - you're only changing your perception of your current reality to deal with it more effectively. Please stop worrying about some other entity being forced to live in your unwanted situation if you jump.

It's right there in the sidebar text, and also in the sticky post:

Active Metaphors - Try out the Hall of Records and Infinite Grid metaphors which illustrate why there is no "other you" involved in a jump. You are radically changing your experience, not swapping physical bodies. For a different perspective on subjective experience overall see The Imagination Room.

Also something that always need to be re-iterated here, relates to the "we jump all the time" concept in its various forms, as explored in a previous thread [POST: Does the number not changing mean that the jump failed?]:

From previous discussions: I'm not sure that's a very useful way to think about it, since it seems to conflate apparent change in sensory experience (the observed seeming transition between already-determined moments which are aspects of the present state) with "jumping". It is more conceptually helpful, surely, to reserve "jumping" as a term for deliberate shifts in state, corresponding to the imposition of a particular fact or outcome. Otherwise the metaphor of "dimensions" no longer has any meaning. [The thread then continues and expands on this]

That is, we shouldn't use the term "jumping" to apply to apparent changes in ongoing experience, including the experience of apparently performing actions or making everyday sorts of decisions (since in a "patterning" type model these are just aspects of one's current state; they do not "happen"). Similarly, the use of "subconsciously" is problematic, potentially, but I understand what you are trying to suggest. Ultimately, if people don't actually read the existing material linked in the sticky posts or do a search of the historical posts, there's not much we can do. Except remove repetitive posts, which we do go through phases of doing, but the larger problem is posters not pausing to think more deeply about the concepts being used, perhaps. It really is all there, stated directly or implied. Sometimes, of course, people really just want to make a post in order to participate in the conversation. And there's not necessarily anything wrong with that.

Q1: That is, we shouldn't use the term "jumping" to apply to apparent changes in ongoing experience, including the experience of apparently performing actions or making everyday sorts of decisions (since in a "patterning" type model these are just aspects of one's current state; they do not "happen"). Similarly, the use of "subconsciously" is problematic, potentially, but I understand what you are trying to suggest.

This strongly reminds me of a clip from a show I used to watch in my child hood [https://www.youtube.com/watch?v=beOgc86jXO8] ("Kung Fu" with David Carradine). It illustrates beautifully the difference between "doing" as opposed to just "seeing" or "witnessing."

Ha, that's very good. I'm aware of the show, but I didn't realise it went quite so deeply into that sort of thing. (David Carradine was a bit less Zen in Kill Bill, I think!)

Yes, intend the outcome - thereby defining it as a fact in a future moment, and so implicitly determining the moments between now and then - and then allow experience to unfold within you without interference. It is already "true now that this happens then", and since the world is a "single, self-consistent, continuous landscape", that means that the sequence of any apparent acts is already taken care of. (We might note, here, that there is no difference between "my arms moving over here" and "the leaves rustling over there": both arise spontaneously within our sensory experience, it's just that we have a different story about the meaning of one versus the other.)

You should check out The Zen of Archery if you haven't already, too [https://en.wikipedia.org/wiki/Zen_in_the_Art_of_Archery].

POST: Did the cup method last week

So, don't expect any particular "experience" at the time of performing the exercise. After all, unless your target outcome overlaps with this moment, there is no necessary sensory aspect to it at the moment of the exercise - we might say it becomes "true now that this happens then". Note that you don't have to do anything in terms of effort; literally follow the instructions as written. Any outcomes will be noticed over the course of, say, a week. In this case, typically outcomes will apparently arise by "plausible, if very unlikely, routes". That is, they will not be directly "reality-breaking". Outcomes are not always the same as "results", too. And so:

Generally, treat this as an experiment - part of an investigation, into the nature of your ongoing experience - rather than a method (there are "philosophical" reasons for this). If you aren't having any results, you might consider choosing another target outcome to start with, and working your way through to your original idea later.

You say "a week". Do you think after a week we should re do it? My first jump worked so well. My second has been well over a week ago. I just want to make some sales.

I'd tend to think a week is a good amount of time for "unlikely but plausible" events to appear, for most reasonable things. Treating this in the spirit of conducting an experiment on "the nature of experience", it makes sense to do the exercise and then give it a good amount of time to see results or effect - it's really down to personal judgement when you think an appropriate amount of time has passed. However: There's no inherent amount of time involved at all, though. At the moment of performing the exercise, it becomes "true now that this happens then", and the "then" could be any appropriate moment in the future. A bit like with the owls exercise, the intentional pattern (the experiential pattern of "the outcome event") will "shine through" an appropriate gap and context. Sometimes you will see the patterning crop up again unexpectedly, depending on how broad the target, how tightly defined its scenario or whatever.

Anyway, no need to bother about that: No harm in repeating now, I'd say.

it's fine to treat it as an experiment, but at some point you conclude the experiment worked or not. This is where the time frame comes in. You wouldn't do an experiment and think maybe 10 years later it will happen at the appropriate time, right? You would make a conclusion if the experiment worked or not?

Yep, hence suggesting waiting about a week. If other things arise later, then they can be taken on board at that time, but there's no benefit in waiting around for decades in anticipation of course! I mention it only because it's worth being aware, for when such an example crops up.

POST: 13:30 is the best time to jump!

PsycheHoSocial: If "jumping" is just you changing your own experience yourself, then there shouldn't be anything ESP related about it, right? Although I'm sure someone can read "13:30 is the best time to do it" and then get results as if that were true, but it would only happen because they've patterned "Doing it at this time means I'll get better results", but not because of the time itself.

That's not necessarily relevant to the topic of the subreddit as such, as per the comment by /u/PsycheHoSocial. That is, while one might adopt that description and intend in terms of it, any successful results would not in fact be because of it. The description of "sidereal time" would not be independently true, as some sort of external framework that is causal. (I also think a lot of time can be wasted looking for "facts" and "techniques" in this way. Aside from the false assumption underlying that activity, it can sometimes create confusion because simply engaging in that search tends to give us some patterned results "as if" they were true - when really it is the fact of looking itself that made them appear so.)

POST: Convince me.

As per the sidebar:

It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not. Never believe something without personal evidence; never dismiss something without personal evidence.

If you find no evidence to support the idea that your ongoing experience is inconsistent with the usual assumptions (that is, you are a person-object in a world-place that is a "stable, simply-shared, spatially-extended 'place' unfolding in time"), then you can draw the appropriate conclusions of course. Or continue to experiment in other ways, or not. Nobody's here to convince you of anything, other than to experiment a little and see what happens.

Putting aside the whole changing "reality" thing for now, I'd say there is still value in examining your ongoing experience as it is actually directly encountered, and considering the implications of that, in terms of what is assumed (in the descriptions we habitually use) versus what is directly known. For example:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

POST: Why around 12-3am?

Certainly, you don't have to do the glasses exercise at 12-3am. If it doesn't say something in the instructions, then it's not an inherent part of the experiment. However, early morning is definitely a "quiet time" with its own sense of occasion. It feels separate from the usual habits and patterns of the day and is low on distractions, and that alone can make it useful or appealing. It is not necessary, though; there is no special reason beyond those benefits. And you don't have to be sleepy to perform either exercise.

POST: "I am not getting results!" Or why meditation is of vital importance.

Others commenters have brought up the "causal" aspect. I suppose with this topic, though, it's worth exploring making a distinction between two related things which can get muddled up with the term "meditation", and how that follows from it:

The first is "letting go", which is really a name for "not interfering" with the ongoing sensory experience - letting it happen "by itself" without counter-intending in reaction to it, and therefore accidentally perhaps accidentally re-implying a previous state. The second is "direct intention" (for want of a better term; all intention is direct really, but you might not intend for what you want directly). By which I mean, if you want to feel quiet and spacious and relaxed without chatter, then what to do is: intend to have the experience of feeling quiet and spacious and relaxed and without chatter.

The latter point is really about actually choosing and actually intending what you've chosen. If you spend time sitting and doing this sort of meditation, you are really just setting aside time to intend a certain background experience. It's "intending time!". For example, you might want to reformat your experience away from the sense of "being an object located within a place", and more towards "being an open space within which a 3D multi-sensory image is spontaneously unfolding". [1] Or spend time directly intending that your experience "soften" and become more dreamlike-associative, rather than stuff-in-boxes (that is, reduce the influence of the pattern "experiential inertia").

But the important thing is that "meditation" as usually understood isn't causal. Only the intention is. That is, any other bits and pieces of theatre you might do besides might imply something, an extended pattern, but just "meditation" doesn't clearly link to an outcome, if you spend all your time looking at breath or saying a mantra or whatever. Doing that, you'll certainly generate an interesting experience or two. And narrowing your attention onto your breath can be pleasant, plus you'll no doubt get a "patterning" effect akin to the owl experiment but for spatial focus: you'll retain some calm afterwards which might stick, because you are implicitly reshaping your spatial attentional focus relative to your apparent surroundings. Implicitly intensifying the pattern "attentional focus includes central body area" just as the owl exercise increases the pattern "owl". However, it may be more beneficial to intend for your actual desired outcome directly.

(Beyond that aspect with other styles of mediation I think you're in effect just exploring your own current patterning, not necessarily "achieving" anything. Which is fine, of course. But there is an expectation sometimes of achievement, and experiential content is interpreted accordingly. However, even if you have an "enlightenment experience", that would just be yet another experience. The only enlightenment is to recognise that all experiences are of the same nature. Now, a "void" experience might lead to that insight, but even then someone might not make the connection between being-the-void and also being-the-content.)

The reason we often have these discussions is, I suppose, because "intention", like "experiencing", isn't describable - since it involves no parts and therefore cannot be conceptualised. [2] We inevitably keep looking for something to "do" and something to "understand", because we make our plans and decisions by thinking. We can't think this, though. Ultimately, then, all experiential content and any apparent actions and thoughts about those are all just "sensory theatre" - they are results. (Results in the sense of being aspects of a state, and the state is patterned awareness, and that patterning corresponds to all "shifts" today, which includes deliberate intentions and their implications. A state is always in a sense a "result", with "shifting" the only cause of changes in state. Which is to say, changes are self-caused.)

[1] Of course, neither of those is the ultimate perspective either. There is no ultimate perspective or experience, or type of experience. The only thing that is fundamentally true is the fact of being-aware or "awareness"; any thing else, not just experiential sensory content but the patterning and more abstract formatting of experience, is relatively and temporarily true only.

[2] There are loads of metaphors we can use to try and illustrate why this is the case, some of which can be found towards the end of this comment.

Words really are a poor way to describe this, aren't they?

They are!

As you point out, it seems so tricky. But really it is just the thinking about it that is tricky - impossible, in fact - because thinking is itself an experience. So you can't truly think your way to any ultimate answer about "experiencing". (It's like trying to make a sandcastle which explains "sand" and "the beach", as in the metaphor described in one of the links). The thing itself is super-simple, and that's exactly the problem!

Zen emphasises that words and descriptions point to experiences, but they are not those experiences. For everyday content, that's not too much of a problem: our conceptual thoughts about things are of the same (experiential) form as those things; our thoughts are little "shadow-sensory objects". But for this topic, we're talking about something that is "before" objects, before division, and so we can't use thoughts in that way. You can't make a non-object conceptual thought! All you can do is make a thought-object (such as the concept "awareness") and declare that it points to something that is a non-object.

Anyway, that's why this subreddit focuses on providing a couple of exercises to try - the main ones in the sidebar, the Feeling Out Exercise, and so on - and metaphors to use, so that you generate an experience that you can then point to, while having metaphors to help you articulate it subsequently (while already knowing that the descriptions are now "how it works", even thought they might be useful for "patterning"). From the start, the very idea of "explaining" in words and concepts is suggested to be problematic. So, if it's like high school, then at least it's more like a research trip to the zoo with interesting shapes and patterns and behaviours to see, rather than a calculus class in a stuffy classroom on a hot summers' day. (Hopefully!)

POST: The Mandela Effect is <maybe> unintentional dimensional jumping into a "created" reality

Where would all these parallel worlds be? And what would their relationship be relative to one another, and to time? Would it not be easier to conceive of there being different states of experience instead? (With concepts like "universe" just being an idea used to form a useful description of experience, rather than an actual independent thing or place. In other words, a thinking framework and not a "reality" as such.)

POST: So, basically everything is fake?

Another is jumping to a reality where you already own a home, this means that you physically or mentally swap places with another you where you own a home. One catch is that you don't know the history of this other world and it might be different to your reality in other ways. That is what this Reddit is about.

Not quite, though. Because it is not, in fact, based upon there being "another you" or "another world".

A description based upon those concepts is one which takes ideas like "timelines" and "physical worlds" as literal external things, rather than as useful abstractions. Within the experience itself, there is no sense of another you or world. In fact, within experience itself, there is no sense of "you" being a person, rather than a that-which-experiences (although our descriptions often do assume there is an object-based you involved). That is why the subreddit is not just about the "nature of experiencing" and changes to experiences, but also about the nature of descriptions. In other words, if we are going to take a step back from the everyday description of the world and embed it within a larger context (e.g. "parallel universes"), the next obvious thing is to take a step back from that and view that within a larger context. Ultimately, we cast a wary eye on the fact of descriptions themselves, and perhaps realise that with regard to this topic they often create more confusion than anything else, if taken to be literally "what is happening".

We might say that all that is literally happening, is your exact experience as it appears. Everything else we claim to be "behind" that, implied as being causal of it, are in fact just more experiences too (the experience of: "thinking about experiences"). They might be useful for conceiving of change, but that are not themselves explanations or causes of change.

7Kek7: We are experience or awareness. The fact that we ourselves create and influence the experience does not make it "fake", though it is certainly not "rigid" in the way that is generally thought.

POST: PSA:Please stop posting"I did X experiment" if you haven't verified your outcome. "physical feelings" after you did any method are all placebo.

100% agree, thank you for posting this. It's the same thing that happens in the lucid dream subreddit where every other post is, "did I just lucid dream???? ? ?"

Yeah, /r/luciddreaming is a very good example of this.

One big problem is simply that subreddits like that get stuck at a certain level of knowledge, because there's only so much to discuss about an experiential topic, while new arrivals begin with zero experience and don't "get it" conceptually until they do. If those with a bit of experience or who have given the topic a lot of thought grow weary of repeating themselves, the balance goes off. However, because the topic can't be encapsulated in one authoritative essay - since it requires a dialogue format which takes into account the present "mental formatting" of both the new arrival and the experienced contributor, and their overlap, in order to properly communicate it - it can be tricky to avoid this happening periodically.

For a topic like this one, I guess one way might be to force people to write a bit more when they post. In your example, if someone is going to write "did I just lucid dream?" (here: "did I jump?") but has to write two paragraphs about it before they can hit submit, then they at least have to give it some proper thought - about their experience, and what it means to ask the question. That is, extended to include commentary on "why do I think this experience indicates a lucid dream, or not?". That way, even though posts might be repeats on a surface level, each post can trigger a discussion that approaches a familiar topic from a different angle, perhaps leading to new places.

Q1: I agree with this point. However, looking at a "hot" post after I posted this one, I sometimes wonder if only a minority in the sub have some sense. Link to said hot post: [https://www.reddit.com/r/DimensionalJumping/comments/6u2p47/2_glasses_of_water_just_tried_it_out/] The fact that its on the hot list, despite being utterly pointless, shows that there is something wrong here somewhere and that many people here truly don't know what they are doing when they "upvote" posts. To upvote is to bring to attention that it is a post that should be viewed, to recommend it, or to laud the post. Let's say the community fully supports these posts , and instead of ones that have discussion, the entire hot post list is filled with such posts, with absolutely no purpose other than a cry for selfish attention. The sub would pretty much go downhill. You might as well introduce a gang of 3-4 bots here and have them act as encouragement bots with a default message of "have fun! Please keep us updated as to how everything goes! :D" , because thats pretty much all there is to comment to these. While I am not at all opposed to the sub being friendly and nice, it will become some kind of depressionhelp sub where the only purpose of people being here is to cheer others and vastly deviates from the philosophical/introspective sub it was created to be (I assume). If they really need attention, there are other subs to obtain encouragement.

I largely agree with where you're coming from. Also:

Reddit and its upvote system is itself a bit of a problem when it comes to more discussion or introspection based subreddits - particularly because people sign up for this sub casually, based on a general notion of it, and then posts appear in their front pages without the additional context, and get upvotes accordingly (as if it were an LOA type deal). This wasn't such a issue when we had a small subscriber base, with contributors who were mostly there from the start plus a smattering of occasional newcomers. It didn't take much to steer things in the right direction without having to be too explicit or harsh with moderation. As we've expanded, it's easy for the balance to get shifted. I'm think I'm going to look at introducing some additional content filtering and, perhaps, add some more specific guidelines as to what is appropriate and what is not, to help people make better decisions as regards posting before they actually write their post. It's something we've held back on, but we want to ensure we are the /r/TrueFilm of this subject area, rather than the /r/Movies. (Both have their place, of course, but there are dozens of /r/Movies already available.)

I would add that some subjects such as suicide and depression can be appropriate topics, if the discussion that results is an exploration of these areas from a "nature of experience/descriptions" perspective. If it devolves into just feel-good phrasings as responses, then less so.

POST: For my media studies class I have to make a 5 minute film. Could anyone please tell me their experience with this?

This comment [POST: This sub feels like what /r/lawofattraction is trying to be], originally intended to highlight the difference between this subreddit and /r/lawofattraction, is probably a good starter to read. (In addition to the sidebar text and its links, of course.) The other response below also captures the essence of it. Ultimately, the subreddit is about investigating the "nature of experience" and the nature of descriptions about experience - by way of personal experiments and contemplation of metaphors, and generally adopting a "meta" perspective.

In terms of experiences, you should really conduct your own experiments (see demo exercises in sidebar) and form your own conclusions! There may be (philosophical) reasons why just listening to "other people's" experiences is not particularly helpful.

I'd perhaps suggest that this topic probably isn't the ideal candidate for an easy 5 minute media studies film, since to do it justice you're going to have to do a bit of experimenting, reading and thinking to properly get it - and even then, it's likely more the start of something than the end! (The common initial impression that it is either about "magickal rituals" or about science fiction-type parallel universes or multiverses is incorrect.)

Q1: I'm new too. In my opinion, this pretty much is witchcraft. They use visualisations, tools, rituals, even chanting to change something about their lives. Witches have been doing these techniques for years. Seems like Someone just connected magick with the scientific theory of multiple dimensions. This is how they explained the Changes one can force upon their life. They must have "jumped dimensions"

That's not the intention really. The techniques are largely irrelevant in a sense (and they are deliberately called "exercises" or "experiments" because the whole idea of methods can turn out to be an issue). The setup is one step more "meta" than repurposing theories - the very idea of the validity of descriptions as explanations Is also under scrutiny, be that for unusual changes or for ongoing experience more generally.

(There is no chanting and all that.)

Q1: Oops I thought i read somewhere there was chanting (or something similar) But other than that I don't follow your reply. Sounds like jibber jabber. Witchcraft techniques are irrelevant as well. Tools an fancy shit isn't needed to practice. Seems like you guys have the same goals as a witch, but just go about it a different way, and call it something different. What is a "repurposing theory" I couldn't even find that on Google search and "one step more meta"??? I never heard that before, Google search turned up "Scream 2", "Ironman" and other movie stuff. I thought it was from a video game haha "the validity of descriptions as explanations " WTF? LoL

"Jibber jabber", eh? Possibly so! As you say, though: you're "new too" and your opinion might, at the moment, be a bit uninformed. (Which is fine of course. That's why it's a discussion-focused subreddit.)

The sidebar pretty much lays it out really, but the background idea is that the "tools" are a starting point for investigating the nature of your experience. So it's half an experimental thing, half a philosophy thing. And then: Yeah, so we can make "rule-breaking" changes to our experiences, but what is the meaning of that? And what does it mean to describe it, for example, in terms of the concept of "dimensional jumping" - can that be taken literally? And so on.

- The "validity of descriptions as explanations" part was about how descriptions don't really get "behind" our experiences and tell us what is actually happening; they are essentially just further experiences (the experience of: "thinking about experiences"). So describing experiences in either scientific or magickal (or whatever) terms can be problematic - or at least shouldn't be taken too seriously.
- The "repurposing theory" part was because you'd suggested that this was about mashing together two theories - scientific multiverses and magickal theory - for another purpose. It isn't. Those two ways of understanding things are just taken as one of any number of descriptions, with none of them being "true".
- The "one step more meta" was pointing to that: we don't take any description of "what is happening" as being correct, because we are also looking at what descriptions themselves are too. In fact, even the idea that there is a "what is happening" might be in doubt!

So - although it's not exactly this - the subreddit topic might be better thought of in terms of non-duality or subjective idealism as its starting point, rather than witchcraft. Not so much about getting results, but about asking: what does the fact that you got results at all imply about what "you" are, what "the world" is, and how those are related?

7Kek7: TG your patience in explaining what is almost unexplainable is quite impressive

Ha, yes: I really should get this pathological optimism looked at sometime! But I do feel that although we can't explain these things in the normal manner, we can definitely circle around them in a way that's helpful, in dialogue, at a slightly different angle each time - and so the "thing in the gap" can be implied, even if not articulated directly.

A1: What he's saying here is the changes you can effect into your life aren't the point. The point is what the changes reveal about reality. The methods don't matter because results aren't the point.

Q1: Oooic thank u

Yeah, that is indeed the edited version of my "jibber jabber"!

POST: I went to a complete different reality for sometime

[POST]

Ok I don't know whether u will believe me or not but I believe that I went or kinda saw an alternate universe . Though I still want your opinion on this.. I have always been an admirer of alternate realities stuff but I didn't knew that there are some methods of jumping realities . Then i found this subreddit about a month ago.(Since then ive been following this subreddit everyday). I kinda understood that mirror method and 2 cups are the two best methods of leaping .Honestly I was kind of scared doing the mirror method so I did the 2 cups . It was really easy to do it but I didn't notice much changes after it. I thought that I should try some new method then I saw this really easy new method 'The Vaccum Method ' . After I researched a bit more about it, I started to practice it every night before sleep and then meditated about it. Ok shit got real today. I really woke up early today and during afternoon time I really felt sleepy and decided to take a nap. I lay on my bed and started 'Vaccum method' excersize again. After doing it I kind of started thinking about my crush and started having a lucid dream. But then kinda my sleep broke after an hour or so. But after I opened my eyes , I saw I was in some different house , I got fucking scared and closed my eyes again , I thought to myself that I might have changed reality but why am I in a house worse than my own house ? Did i come come to a worse reality ? I opened my eyes again and saw that same house and closed my eyes again. Now I started sweating and panting. Here I understood that this was real not a dream cause I felt my sweat . Then I opened my eyes and saw my own house , I really felt happy and relieved All I want is that u guys give your opinion on this. I believe I shifted for sometime ,do u agree or have some different thoughts Sorry for typing mistakes and bad grammar

[END OF POST]

Just as an aside, it's worth pushing back a little on the idea that there is some amazing method - the method - out there to uncover.

Much as it's tempting for newcomers to want to jump on a "fool-proof method", it is important to consider how any "method" relates to your actual experience, to the nature of it. Otherwise there's a risk of just engaging in yet more "sensory theatre" without really digging into the underlying situation - and going through the loop, once again, of finding something new, getting a sorta-result, then it not working, and then moving onto something else (because you never really knew what was working about it in the first place).

If ultimately what you're doing is lying down for a bit and imagining some crap for ten minutes, or saying some words for a while, it's worth pausing to consider how precisely that would make any difference to your experience. If that question isn't answered, if you don't dig deeper into it, then it's really just a superstitious activity, with no idea of the "causal" element of any change - and (interestingly, tellingly) you often find the reliability of a "method" fades out pretty quickly.

This is why the two exercises in the sidebar are really intended as illustrations of something, rather than methods as such. (Although of course the subreddit is built out from an original idea that there might be a "technique". But then deconstructing that notion to gain insight.)

It isn't exactly explained why the exercises work either.

The exercises may or may not work: they aren't promises, they are experiments.

If they do work (or more broadly: if experiences arise subsequently which seem related to doing the exercise) then that's a starting point for contemplation. A starting point for considering what those outcomes imply about the nature of your experience (of "you" and "the world"), perhaps leading to an insight or at least a revision of your description of things, or even of your attitude towards descriptions in general. This may even include revisiting the whole idea of there being a "how things work" at all, in the usual sense.

Anyway:

What the exercises are, though, is the stripped-down essence of an approach for investigating this. So just making up variations of them with extra stuff on top - saying this or that, imagining this or that - in the hope that some "secret sauce" will be discovered that gives "results", without having a clear reason for the additions, probably isn't very useful.

Doesn't change happen because you want it to happen?

That's an interesting hypothesis. How could it be tested? What exactly is the nature of "wanting", and why would it be relevant or causal in terms of generating subsequent experiences? How does "wanting" relate to "me" and "the world"? And how, precisely does one go about "wanting" anyway?

So, perhaps the question isn't so much "why wouldn't it work?", but rather: "why do I think it would work, what is the basis for the choices and additions I am making, and how to I test those assumptions specifically?"

With all the proof out there from this Reddit and Glitches Reddit combined there has to be something to this.

The idea behind the exercises is that one can actually check for oneself whether there is something to it, or not, rather than just reading stories about it. And then, because they focus on two particular facets of experience related to this, dig deeper into the nature of it by targeting different aspects of experience in turn. (There may also be a philosophical problem with "other people's stories", that isn't even just about believing them or not.)

So, you are saying the exercises may work but not because of the exercises but something we don't quite understand yet?

Ultimately, I'd end up suggesting that what one might end up discovering is: it's more fundamental than any of those ideas you list would suggest. It is "before" them. All of those ideas still have, as an assumption, that you are some sort of person-object located within a world-place. And ultimately, they are all essentially little "stories" about the content of experience, rather than the nature of experience itself. That is, the context of all experiences.

This is why we keep coming back to this notion that, when we come up with "explanations" for things, we must also bear in mind what a "description" actually is. Does it get "behind" our experiences? Or is it, instead, just another experience also (the experience of: "thinking about experiences"), at the same level. Saying that something is magick or witchcraft or virtual reality or whatever, doesn't really add anything necessarily. (See also this comment about the literal "parallel universes" or quantum physics type explanations.) Particularly when we are dealing with an experience of world-facts or the "formatting" of experience changing. Descriptions might be useful ways of thinking about such things, but they don't really - cannot really - encapsulate their nature or the cause of them.

If we go one step more "meta" in this way, it's like we take a step back from both our main strand of experience and the descriptions we make up about them. The problem we end up with, though, is that we're now dealing with something that is "before" concepts. How can you describe that which descriptions are "made from"? And so on. But maybe you don't have to describe something, or be able to communicate it, in order to know it. And perhaps demanding that something be conceptualised or restricting oneself to explanations - requiring that something "makes sense" or that it can be "understood" - is a barrier to a more direct realisation of the true situation. In other words, I might end up suggesting that it's not that there is an explanation for how the exercises work (or any other methods in fact), in a fundamental way anyway, but that the attempt to construct one, or the willingness to put our experiences and assumptions under the microscope in this way, might lead somewhere useful regardless. Even though it perhaps can't be articulated.

Extra bit: If making changes is simply about thinking (of? about?) what we want, then we must still consider what exactly we'd think - because there are many ways to think a thing of course - and also consider how that relates to the world (is the world itself a thought, if so in what way?) and what we are (if we are the thinker of thoughts, where and what are we and what are thoughts made from?), etc.

POST: Has anyone had success with the "Vacuum Method"

[POST]

Hi Everyone, Recently I've been keeping up with this forum in hopes of changing a decision that I made in the past. I have read of this new method from TheFirstGlitcher, I would like to use it prevent myself from making this decision or shifting into a reality with a new past in which I had never made this decision. I created this forum to find out if anyone besides TheFirstGlitcher has had success and their opinion if I would be able to switch to an alternate past or someday miraculously wake up in the past in which I can stop myself and this will all be part of a distant memory that was unreal. If it's not possible, I understand, but I would like to hear your opinions. Thank you so much! Please let me know what you think, any response is welcome! Also I'm not sure if I have done it correctly, this is probably why nothing has changed, but I also wonder if the shift that I want is even possible?

[END OF POST]

A: You could take a random carrot, declare that carrot as blessed and eat it and get results..

Q: lol I see your analogy, but why is it that these methods work for some and some it doesn't work. Most people claim that it is possible for anyone to jump for anything. I'm asking if there is a full proof method to make it work or if it is even possible to cause a shift in reality because if I wash my hands in hot water I'll still burn my hands, the world is very real to everyone so why is it that some experience these shifts and some do not and if it isn't possible to revert the past or a past decision doesn't this limit the ability of a dimensional shift. It's not so much I'm skeptical, I want to learn more about it as I wish to revert a decision I made and the people of this sub Reddit such as yourself seem to have more exposure to this type of information. Thanks!

The idea isn't that that your experience of the world isn't real - after all, in a dream you can kick a stone and hurt your foot and refute nothing about the dreamlike nature of it. The experience is always very real, because it's the only thing that is real. Whether it is consistent, and what the nature of your experience is, that is what you are pushing against I suppose. So rather than the world not being "real", it's that your standard description may not be an accurate accounting of it. That is, that the idea that you are a person-object located within a world-place may not be a good description of your actual experience (where "the world" is typically assumed to be a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'"). The world is real, but it may not be "real" in the way you have been thinking that it is "real".

As for "methods", maybe see my other comment below. The very concept of "methods" and "techniques" (fool-proof or otherwise) can be a distraction here.

...

The "Vaccum Method" is a post someone did a while back. It's worth pointing out, though, that the two exercises highlighted in the sidebar - and they are deliberately named "exercises" rather than "methods" or "techniques", because those terms tend to imply something about our experiences that might not actually turn out to be true - are intended to illustrate two aspects of experience (which turn out to be the same thing actually). That is, they are not simply self-help style techniques for bringing about change. In other words, it's not the change that's important, necessarily, it's the fact that there was apparent change at all that is key. Other (so-called) methods and techniques tend to just add extra "sensory theatre" on top of these key aspects. This can end up obscuring the genuine insights that should follow from a proper "experiment and contemplate" type investigatory attitude. So, when encountering a new "method", it's worth asking the author how, exactly it is meant to work, and what the thinking behind it is, and then probing the assumptions that lie behind the concepts used in that thinking. Otherwise we risk simply, almost superstitiously, doing various actions and hoping, somehow, that change will occur, with really understanding the "secret sauce". Otherwise, in fact, people are at risk of taking a "cargo cult" approach to the subject (that is, emulating the visible actions only, while never grasping the "motive"). Hence the (intentend, anyway) strong "philosophical" component of the subreddit: unpacking assumptions rather than just trying out tricks.

POST: My perspective on dimensional jumping (Introduction to creating reality with your thoughts)

EDIT: The point of this comment was to try and explore in more detail what, exactly, the concept of "thoughts create reality" means, from a particular perspective on the nature of "you", "thought" and "reality". However, it's a bit muddled in the execution, oh well. It might be worth explicitly distinguishing between passing thought and deliberate, intentional thought. This potentially allows us to clarify that it's not the thought as such that does anything; thoughts could be viewed as simply pseudo-sensory aspects of your current "state", really. (Where a "state" is the current set of fact-patterns contributing to, and fully defined the future moments of, your ongoing experience.)

Rather, it's the intentional content - or the "direct meaning" - that makes the difference. Here, by "an intention" we mean the fact or pattern that we seek to increase the relative contribution of, and by "intending" we mean the increasing of that contribution (whereby shifting the "shape" of one's state, of oneself). There is no act involved in this, though - there's no mechanism or technique. One simply intends. Meanwhile, the sensory thought aspect is itself a result of intention, not a cause; it's a bit of theatre. Now, for sure, you can get synchronicity arising if you visualise something - a bit like having deformed a surface and the contours being overlaid upon experience from then on, or drawing upon a television screen and the pattern "shining through" the gaps to be incorporated in every image to some extent (see: the owls exercise, for example).

However, a fact is itself an experience of "meaning" - it has no spatial or temporal component itself. It is unbounded and sort of "dissolved" into the background of your experience, with only its sensory aspects arising occasionally. So when you want to intend a fact, just conjuring an image or saying a phrase isn't necessarily what you want to do. Certainly, it may trigger the fact-pattern by association, but really what you want to do is intend the fact-pattern directly. This can't be described in words, but you "know" when you are doing it. You do it whenever you shift yourself in mundane ways. (Ponder: do you conjure an image when you change your destination when walking along the street? No, you feel-know-intend the change, directly.)

There is not a "you" and "the world"; there is just you-as-awareness which has "taken on the shape of" the experience of being-a-person-in-a-world. Whereas the construction of language forces us to talk of a "doer" and an "act" and a "thing done to", in our actual experience this is not the case. Attempts to enact "doing" tend to complicate things or lead to failure, because we assume a separate mechanism that we are trying to harness. In fact, there is no mechanism: we shape-shift our experience, our state, via intention, which is self-caused change.

All of this suggests a very fundamental reason why we can encounter difficulties:

- Intention is literal and direct.

Thinking doesn't create your reality, your state. A thought actually is a pattern within your state. A passing thought is a view of your current state; a deliberate thought is the intensification of that pattern in your state. It's almost claustrophobic to think about: there is no separation between you and your state, you and your thought, you and your sensory experience, you and your intention. There is no gap between thinking, intending and experiencing.

The point of this, is that the thought "I am happy" literally is the fact-pattern of "I am happy", and increasing its relative "intensity" of via intention will increase its contribution to your ongoing experience. However, to be clear, it's not the words "I am happy" that you want to intend - that is a mistake easily made (leading to all sorts of synchronicity about happiness or the phrase "I am happy"). Those words are part of the extended pattern of being-happy and can be used to trigger it to an extent, perhaps.

However, it's really the fact-pattern of which those words are a sensory aspect that you want to intend.

This literal nature means that you need to be aware of what, exactly, you are intending, because the mechanism here (if it can really be called a mechanism) is that of a "dumb patterning system", a direct deformation of your present state. There is no intelligence between you and intention and the change of state. If you conjure up "this visual image", then that visual image will be more prevalent in your experience. If you conjure up "this visual image which means that fact will be true", then that fact will be more prevalent in your experience (and probably the visual image too).

Essentially, then, it's like you are drawing patterns directly upon awareness - sometimes in 3D, sometimes "non-dimensionally" and abstractly; sometimes sensory images, sometimes "facts" or "formatting" - thereby increasing their prominence in the unfolding world-experience from that point onwards.

Can you give examples highlighting the difference between "this visual image" and "this visual image which means that fact will be true". Like if I imagine myself holding 2 million dollars in cash, is that belonging to the first or the second category?

It's probably better to experiment with something more abstract. So, first imagine a sphere in front of you - say, a blue sphere with no particular detail, just floating there. Okay, now imagine a sphere in front of you, identical in every way to the first, except also imagine that this sphere is imbued with the special power to make the room filled with joy. But do not change the sensory aspect of the sphere in any way when you do this.

This is basically "imagining the fact of something being true" abstractly. That is, that an object, or your ongoing experience more generally, has a property, without actually visualising any sensory aspects to that property. Instead of doing all the "sensory theatre" of picturing stuff, in an effort to associatively trigger the fact or as an excuse to do so, you can just directly do intending-asserting of the fact into greater prominence.

Finally, after taking a pause to clear yourself out a little, instead of using the sphere image, simply directly intend that the room is filled with joy, and experience the result of that. That is, wordlessly intend the fact of: "it is true now that this room is filled with joy". And, um, enjoy. Aside - Note that there is no effort in doing so, and any "trying" will just distract you, amounting to an intending of the "feeling of trying" rather than the fact of "joyful room" being true.

I can see the differences between the two explanations.
"Imagining the fact of something being true" = Imagining the fact along with the emotions you will (expect to) feel from having it
Image = Yin
Emotions = Yang
Yin/Yang = Manifestation/Shifting
I think that some people would have to be at a point in their life to where they understand themselves better to really grasp this concept.
If someone has constant inner/outer distractions or conflicts then this maybe extremely difficult to conceptually grasp yet perform.
I'm fairly new to this but I would appreciate any feedback.
Thanks.

There can be a difficulty, sometimes, with elevating emotions and treating them as if they are special rather than just another sensation-perception within an experience (albeit a difficult one to put into concepts and language). I suggest that emotions would be best understood as a sensory aspect of the fact, arising as an object within experience.

Meanwhile, the fact itself is sort of "unbounded" or "timeless and spaceless". It is not experienced as an object, instead it's sort of just "known". You might call it a sense of "meaning".

So, while "imagining (intending, asserting) the fact of something being true" might result in an experience of an emotion, it is not necessarily required, and the emotion is not itself a cause. When we say "the feeling that something is true", we aren't referring to an emotion, we're referring to a felt-knowing, a global sense of a particular thing being true. The problem with some approaches (many LOA descriptions included) is they miss out this "secret sauce" and therefore just produce minimal intensification of some of the patterning associated with facts, rather than direct addressing the facts themselves. This can still produce "results", of course, as synchronicity (basic "patterning") but it can be frustrating to work with, because there's no real understanding of the cause ("intending").

Unfortunately, this activity of "intending" can't be described at all, really, only pointed at. Intending has no mechanism or method, and is before "things" so is non-conceptual. And so we hit the difficulty whereby people end up focussed on what can be talked about and thought about (basically: objects within experience, which are results) and miss out (when writing) or don't realise (when reading) that there is a specific actual cause of all change (which is not any one of those experiential objects). We then can end up with a "cargo cult" version of the topic:

The term "cargo cult" has been used metaphorically to describe an attempt to recreate successful outcomes by replicating circumstances associated with those outcomes, although those circumstances are either unrelated to the causes of outcomes or insufficient to produce them by themselves. In the former case, this is an instance of the post hoc ergo propter hoc fallacy.

(See: Richard Feynman's fun lecture also.)

That is, people try to generate the results by just intensifying part of the pattern associated with the target fact, perhaps getting some outcome by association, but not really going for their target directly. The distinction between doing the owl exercise (increasing the intensity of contribution of the "owl" extended pattern) and actually intending a specific outcome ("it is true now that [this fact about owls]"), basically. Or between imagining some objects (the blue sphere for example), as opposed to: imagining some objects while asserting-intending-knowing it means-that something is true or will happen.

In this context, isn't the cause (to create) and deliberate intending the same thing?

This is why all of this ultimately leads to an exploration of the "nature of experiencing" - that is, examining what "you" are, exactly, and what your actual relationship is to "the world".

Intending, then, is like "shape-shifting". You might say you are shifting your state, where by "state" we mean the set of relative contributions (or "intensity") of all possible facts or patterns, which means to shift yourself. There is no "you" and the "state" or "world" - instead, you sort of "take on the shape of" a particular situation or experience (in the broadest sense, not just the current sensory moment). Right now, you have "taken on the shape of" the experience of apparently ("as if") being-this-person-in-this-world.

So there is, as you say, no difference between causing and intending. We might define "an intention" as the fact or pattern we wish to increase the contribution of, and "intending" as the intensifying of that pattern - shifting to a state where that fact-pattern is more prominent.

Although we often use the word "create" for this sort of thing, actually that's strictly speaking not ideal. The implication of the above is that all patterns exist, eternally. Patterns are "before" time (with time, or change, being an aspect of experience, a pattern like any other, rather than something fundamental). They cannot be created or destroyed; they just are. This means that every experience, at least implicitly, is always available, and that we simply "shift our posture" such that some are more prominent than the rest.

Now, returning to what "you" are, if you discount anything which changes in your ongoing experience (how can something be ultimately true, if it can shift?), the only permanent thing turns out to be the property of being-aware. Or at least, it is meaningless to talk of the absence of that. All other facts or patterns can be more or less "true", but not that.

Putting it all together, then:

We might say that what you truly are is "awareness" which is "taking on the shape of" states of experience. Between shifts, the sequence of moments you experience is fully determined by the facts within that state. The apparent change of sensory content moment to moment is actually static also in this description: "time passing" is just another pattern, albeit a more abstract formatting than most. The only true change that ever occurs - and hence the only cause of apparent change in ongoing sensory experience - is when we "intend", which is just word used to point to the act of us shifting ourselves to a different set of prominent facts.

...

I suspect we are probably talking at cross purposes a little, since we are using some words in different ways, and some underlying assumptions are perhaps different. The word "thought" is a problematic one anyway, I guess; it's too vague!

So, in your description, where (and what) are "you"? And where would "another consciousness" be, relative to that?

This is why I am having a hard time separating intention from other thoughts.

In type or nature they are identical, of course. However, there is a distinction to made made between thoughts which simply arise spontaneously, and those which arise from deliberate intention. In the first case, it's just a passing thought appearing in accordance with your current state (more later), in the latter you are reshaping your state by way of deliberate thinking.

There is no difference in sensory experience between the two. And in fact, there may be no sensory aspect to intending if there's no result component which overlaps with the current moment (although one "knows" one is intending.) The "how" cannot be described, because it is like "shape-shifting". But there is a difference in that one is an aspect of "how things are" and one is "changing how things are".

So, pondering -

"Intention", then, is simply a term used when referring to a "pattern" that one is increasing the contribution of ("intending"), which is done simply by "thinking it" or 'imagining it" or more accurately: "experiencing it" or "asserting as an experience". The fight with language here is because we want to avoid implying that there is a "thinker" who then "thinks the thought", with one being "over here" and another "over there" in any sense. Really, one "takes on the shape of" the fact, pattern, or experience. This last point is key.

Loosely, the outline of this description would be:

- The only fundamental fact is the property of being-aware - or "awareness".
- All other facts are relatively true only; they are temporary. They can be conceived of as "patterns" in awareness.
- All possible fact-patterns exist eternally, "dissolved" into the background. Your state is the current distribution of relative intensities of those facts.
- What you truly are, is "awareness", and this is always true, regardless of what "shape" you have taken on.
- Currently, then, you-as-awareness have "taken on the shape" of a particular state. This state consists of all the facts or patterns currently contributing to your ongoing experience. It fully defines your experience - as in, all subsequent moments are fully determined, between shifts of state.
- To alter your experience, you shift your state by changing the relative intensity of a particular fact or pattern. You do this simply by "intending" - that is, a sort of "thinking" but not a thinking about, rather a thinking as. Still better described as a "taking on the shape of" or "becoming of" a situation.
- Intending cannot be described (because it is "before" concepts) and is non-experiential (has no inherent sensory aspect), although sensory aspects may arise from doing it if the change in state involves an impact in the current "moment". However these are results of intending, not causes of outcomes.
- There is no "outside" to experience, and awareness is "before" division and multiplicity. The only thing that is "happening", is this exact experience, right now. And thoughts you have about an "outside" to experience, are also experiences (that is, the experience of thinking about experience) and are "inside".

And so on.

As the last point suggests, though, there's not all that much point in thinking about this relentlessly, because ultimately thinking is just another experience (although by doing so deliberately you are to an extent "patterning" yourself for future experiences: so we might choose our models carefully if we are going to focus on them a lot). Simple experiments and exercises show the way more clearly, once we have put "descriptions" in their proper place. For example, the Feeling Out exercise at the bottom of this comment is useful for bringing us back to our actual situation, rather than an idea about it.

POST: In what way are other people real?

Let me have a go here. It seems that you perhaps are still partly identifying as a person, and implying that this person is in a "place" of some sort with other people, and you're saying things like "my awareness". This can lead to an incorrect imagining of the situation, I think.

It is not your awareness, I'd suggest. It is just "awareness". What you are, is "awareness". That is, that which has as its only fundamental property the property of being-aware, and which "takes on the shape of" experiences - including aspects like "spatial extent" and "time passing" - playing out currently as a series of multi-sensory moments. Right now, you-as-awareness is "taking on the shape of" apparently being-a-person-in-a-world. All that is fundamentally true is being-aware, but you-as-awareness are having experiences "as if" other things are true.

Pause for a moment and check your actual experience as it is. I suggest it is something like being an "open aware space within which experiences arise" - like you are an unbounded mind, with a stable, bright, multi-sensory, 3-dimensional thought of being in a world floating within it. In what sense, then, are you a person? What does that being-a-person consist of? Surely, it is just sensations, perceptions and thoughts - with the idea of being a person occurring from time to time? You don't actually experience being a person at all. Other people, similarly, are made from that. Basically, visual, auditory, textural, and so on, aspects and a felt knowing. All of which arises as a 1st-person perspective. And that's important. That is, as soon as you find yourself thinking about this and imagining the situation from an imaginary 3rd-person "view from nowhere", then you are immediately "wrong". Because you are not inside the world; rather the world is inside you, with a particular sensory aspect of it being "unfolded" at any, or as any, particular moment.

You are then left with identifying the actual properties of this 1st-person mode - which is all there is. For example:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

This final observation is important. Specifically, that "awareness" is "before" things like division and multiplicity, objects and change, and so it makes no sense to talk of "an awareness" or "other people's awareness" or any number regarding awareness at all. There is just "awareness"; uncountable. You can't relate different experiences or perspectives within a framework of time and space, because time and space are themselves aspects of an experience. (Although obviously not accurate, the Hall of Records metaphor tries to offer a easy way into envisaging that.)

it literally felt like I was somewhere in my head, so I had to stop the exercise.

Sometimes it helps, here, to then notice where, exactly, you are experiencing that location from.

Sometimes it is discovered that you are sort of "looking at" that felt location from outside of it. Sometimes it is noted that the "feeling of being in your head" is a feeling within a larger field of "feeling-space". Both of which mean, of course, that you are actually not just in that location, because otherwise you couldn't be aware of the location within a larger context! You must be the context, in order to be aware of a location within a context!

As you imply, though, it can be best to just leave things be if they are a struggle, and let it percolate for a while. Occasionally, doing these exercises can feel quite claustrophobic, as you try to "capture" yourself within your attention, and discover that this isn't possible (because your attention is within you, not the other way around). The trick, overall, is to eventually cease trying to effort it into getting a conclusion, because efforting is itself a deformation of your "shape", like rippling the water you are trying to see a reflection in. Anyway, it's good to return to this one now and again even after you've "got" it - it can be very pleasant and relaxing to remind oneself of it when it is noticed we've become "narrowed down".

Q: Sometimes it is discovered that you are sort of "looking at" that felt location from outside of it. Sometimes it is noted that the "feeling of being in your head" is a feeling within a larger field of "feeling-space". Both of which mean, of course, that you are actually not just in that location, because otherwise you couldn't be aware of the location within a larger context! You must be the context, in order to be aware of a location within a context!
Wow, this is really good; I didn't think of it that way. Perhaps I should have persisted with the exercise a bit longer. I'll definitely give it another go. What would you say for the first exercise, "feeling the edges" of your experience? Do you mean in the sense, that, when you close your eyes, you try to find the "edges" of the "blackness" that you see, or the "edges" in terms of the "mental space" of the mind?

For the first - words are problematic, I suppose, but I do mean feel out, mentally, or with attention, to see if there is a "boundary", an end, to your moment of experience in any direction, and if there are any "edges" to it. It's not a visual thing, particularly. Perhaps sensing is a better term to use. "Mental space" is a good enough term, although of course that does presume a result (that there is a mental space in the first place).

What is concluded - you can check for yourself, definitely don't take my word for it - is that "being" has no edges or limits, but also that it's not necessarily got spatial extent either. So perhaps "openness" or "void" ends up being the way to describe it, with your current spatially-extended sensory moment floating within that.

Ultimately, we're just noting that the idea of an "inside" or "outside" to experience is meaningless because, as we've just explored with the "where am I?" thing, any discovery of an "inside" already implies that you are the context of that "inside", and so you are the "outside" too, and that is also within/as you. This then helps us note, again, that "sensory experience" and "thoughts" are of the same nature, further emphasising that thoughts about an outside are themselves just more experiences within/as us ("inside").

You can see, here, how lots of the usual questions we might have asked earlier become nonsensical. By the time you get to the end of it, questions about "inside" and "outside" have resulted in answers which make those two words quite problematic to use! The answers actually destroy the questions!

Every time I read one of your posts lately I feel like we are on two opposite sides of a coin. I read something and my immediately reaction is "That's not right at all!" then two seconds later it says "Oh wait, no I see what you mean, your just looking at it from the other side". There have been a few of them like this lately, that I have difficulty reading and then suddenly have a flash of intuition of "I don't know what he's saying, but I know exactly what he means". It seems like your approach "pulls out while pushing in" while mine does the opposite. Instead of pulling out to find the edges of my awareness, I envision pulling inwards to a core identity. From there I ask what is the "he/she/they" that exists before my pattern is placed on top of it to filter it. In that sense another person is a core identity that my belief puts through a filter. As I see my core identity as multifaceted and capable of anything, so must the other person be. So in that sense if I go from a reality where a person dislikes me to one where they like me, I didn't change them because between my core/higher self and that persons we've established agreements on how to express all of those energies and let out awareness choose the ones we want.

It's sort of both, simultaneously, really, the "pulls out / pushes in". It's that thing of there being "no-thing" but also "all possible patterns, pre-existing and eternal", at the same time. And you could look at people that way, too: that the "larger person" is all possible versions of that person, and you're just seeing one "aspect". To some extent, though, we're just playing with descriptions there, but I think it gives an intuitive way of thinking about the sort of experiences it is possible to have.

POST: Successfully jumped to contact Future Self. Have evidence of success.

[POST]

Soon after contacting my Future Self, and asking for clear manifestations from him that would leave no doubt in my mind as to their source, the following video manifested in my reality:
Scientist have Evidence that our Future Decisions can change the Past Reality
A clear message: There is science to justify what you are doing.
X-Post from /r/DangmaDzyu

[END OF POST]

So, normally this would be removed because of rule 3. and it also seems a bit off topic with the link:

3 - Links to possibly useful material should include discussion as to its relevance, and a personal review if possible.

However, it's worth having the discussion.

First, I'd say that science does not justify what you are doing. (See previous comment elsewhere on that topic and also in this thread, to save me reproducing it. It references the simulation hypothesis, among other things). However, this is not a bad thing. This subject is inherently unscientific - it is philosophical or metaphysical. That doesn't mean that it doesn't involve things that are true, though. Science itself doesn't discern truth, merely whether a particular description is effective or not, so one shouldn't feel the need to have one's ideas confirmed by science as some sort of stamp of authority - but, that does not mean we shouldn't be rigorous about our own thinking about our experiences.

Second, following from that, I'm not sure why you would necessarily attribute any experiences you have to a "future self". It is important, here, to separate out the direct content of an experience we have, versus the description about that experience. This recent thread digs into this issue when it comes to the topic of "higher powers" - I think the same unpacking applies equally to "future selves". In short, one should be wary of the extent to which you are simply filling in the gaps with a bunch of ideas or assumptions, with no "touch-points" to the actual experience. It can be best to keep a "meta" perspective, where we don't commit to any description, merely find it useful or not (and bear in mind the nature of descriptions throughout).

POST: Suns of Eternity after Two Glasses, possible jump?

What "higher powers" would these be? More specifically, where would they be relative to you, and how exactly would they influence your experience? (We shouldn't just take these vague notions for granted without digging into them a little, or else we can end up accumulating stacks of semi-superstitions that are not in fact experienced. Just because you might have an experience "as if" something is true, doesn't mean that that description should be taken as "what is really happening". It's important to keep returning to what exactly was experienced, so we don't risk potentially getting distracted by little fluffy stories.)

...Okay, but: why? Why believe those things? As in, what in your direct experience has led you to believe them? And believe them in preference to other possible descriptions?

This might sound like I'm pushing back against your beliefs, but that's not quite my intention. Part of this subreddit is (meant to be) focused on examining the "nature of experience" and the nature of descriptions about experiences. And so, if we were going to talk about "higher powers" or "signs", we'd inevitably dig into why we might think there was something "separate" or "out there" that was doing things, and so on. And so: In such an investigation, first we might end up focussing on confirming (or dispelling) our everyday assumption that we are a person-object located within a world-place. (Where "the world" is described along the lines of being a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'".) That is, checking whether that is an accurate description of our ongoing experience or not. The demo exercises in the sidebar are one

way to start playing with that, for instance. And then, if we move beyond those assumptions, we must then make sure we aren't just swapping one story for another - making the same mistake, in a different way. Even the notion of "dimensions" as places is potentially suspect, and so on (since at face value it still characterises us as an object in some sense, when we don't really experience ourselves as that, perhaps).

None of which is to say those descriptions can't be useful, but that is different to saying they are fundamentally actual. The experiences might be actual, but the descriptions of them might be best viewed as metaphors or narratives - and this includes "dimensional jumping" itself. (For fun, do maybe check out the little exercise in that link, as a way for us to maybe get past the concepts here.)

Looping back to the idea of a "higher power", then, it is might potentially be viewed as a black box concept to fill in for the fact that only a minor aspect of our present state is seemingly unfolded "into the senses". In other words, the "higher power" idea is a side-effect of the error of conceiving of ourselves as an "object in a place": it is a problem with the description rather than an aspect of actual experience. The generalised version of this view is that our ongoing experience appears to be "patterned" in certain ways - that is, our experiences have content "as if" things were true. But are those things fundamentally true?

If something can be changed, it cannot be fundamentally true. Sometimes we might have experiences "as if" there are higher powers, other times not, and so on. What is the only unchanging property of our experience? Is it perhaps only the fact of "awareness" itself? What else is definitely always true? Etc. That is the challenge: to investigate what is true. And that's one reason we'd maybe push back on descriptions of "higher powers" and "signs" or indeed "dimensions" - to see if we can have experiences as if they are not true, or differently true, as well as apparently true. Again, that doesn't mean we can't find particular descriptions attractive and enjoy them; however, if we are being sincere then it's important to take account of the nature of descriptions themselves. You get the idea!

...I guess the key idea is that we don't let the content or context of our descriptions go unexamined. Or perhaps better to say: it's completely fine to use one description or another, but we choose to also recognise the nature of those descriptions. (Which are perhaps best considered as a sort of "parallel experience": the experience of "thinking [or feeling] about experiences", which doesn't get behind the experience.)

And so, please don't filter yourself when you post, because of course "beliefs" are themselves an aspect of experience - and what we're ultimately about here is an exploration of the nature of experience. However, have in mind that "meta" perspective where we are taking one step back from the descriptions we use. Importantly, even though descriptions might not be "true", that doesn't mean they're not useful. We may certainly have experiences "as if" they were true, and that is itself of interest: just because our descriptions and beliefs don't explain our experiences, doesn't necessarily mean they can't be used to pattern our experiences - a reversal of our usual way of thinking about them, and itself a reason to keep an eye on them.

TriumphantGeorge Compendium - Part 12

POST: Isn't this too good to be true?

[POST]

So you're telling me that I can just jump to another dimension whenever I want to change something. Isn't that sort of cheating? And how could it even be safe? I don't think we were supposed to be able to jump between different universes

[END OF POST]

Basically, the theory is that your subconscious mind is creating the universe that you perceive.

Well, not quite.

What exactly is a "subconscious" and why would it need to be convinced of anything - what power can it have to manifest things in your "reality"? I think it is worth considering that the idea of "the subconscious" is a needless conceptual filler: it is never actually observed, its introduction does not actually explain anything, and it has no link to our direct experience. It also presupposes some sort of division between "you" and "the world" and an intermediary or "mechanism" that operates in the background, unobserved. It's not clear that this is justified.

All of this is conjecture of course.

Yes, that's the theory - and nicely described, too! But then, to what extent does it connect to our actual experiences? Isn't it just a placeholder or conceptual connective tissue to join up what is experienced sensorily? That is, is it perhaps more of a "story" or a "language" than it is an accurate explanation of our actual experiences - particularly for our current topic of discussion: experiencing changes in the world which apparently break our standard description of it as a "place"?

The number of "observational touch-points" that connect the idea of the subconscious to our lived experience seem few, to the extent where it might be better not to invoke it at all, especially when it takes the form of a pseudo-computer-programming analogy (as it tends to do these days).

I guess I'm saying that I see no reason to believe in the concept as "true", although one might find it a useful way to talk about things (while remaining aware that it is not what is "really happening"). It's the crossing of that line that I find perhaps unhelpful - again, particularly in the current context, for various reasons. It all hinges on what exactly you think "you" are, and what the relationship between "you" and "the world" is, of course. For example, I'd suggest that we can't simultaneously invoke a psychologist's idea of "the subconscious" and also the law of attraction type idea of "the subconscious", since they would require different notions of "you" and "the world".

Sort of related: I quite enjoyed this article about Freud recently. An extract:

Freud believed that all cognitive processes are unconscious. What we call 'conscious thought' is just the brain's way of displaying the output of unconscious cognitive processing to itself.

Now, from that I'd probably suggest deleting the notion of "the brain" or "processing" (these are never observed), and simply say that conscious thought is. All the rest of it comes about because we make the error of thinking that all experience must be expanded out into objects, or it isn't there. Unconscious thought - or "the subconscious" - isn't unconscious at all. It is here, now, in experience as an "awareness context": but you might say it is enfolded or "dissolved" into and as the background, rather than unfolded or "expanded" into the foreground. However, that means it doesn't "happen" or "process" anything or do any thinking - it is more like a static landscape or state with sensory experience an aspect of it, with nothing outside of that, and it is not personal.

POST: Did the Two Cups Intention Method Last Night... and Woke Up Today Filled With Negative Emotions and Hostility

You're overthinking this, I'd say. And "spiritual contracts" and "negative vibrations" have nothing to do with this - or, at least, you should very carefully consider what those concepts have to offer in terms of a useful accounting of your experiences, rather than simply accept such ideas at face value. If you've performed the two glasses exercise, then the only result that matters is whether, at some later time, the intended result arises within your experience (or not). It is problematic to attempt to attribute any other experience to the exercise: it can quickly lead to all sorts of superstitious type thinking, since any reasons you come up with are inevitably going to be completely ungrounded in actual experience. That is, you'll probably just be free-wheeling all sorts of vague ideas based on whatever you have previously read, but never actually experienced personally. For instance, do not assume that this exercise is based upon occult ideas or multiverses and the like.

My suggestion: follow the last instruction, let it go, and deal with any specific outcomes as they arise, and not before.

POST: Superhero Dimension

Alright this is going to sound stupid. Is it actually possible to jump to a dimension where superhuman actually exists? If so, is it possible for me to gain Superspeed in that dimension?

Q: No, it's 99.99999999999999999999999999% likely that it isn't possible.

How are you calculating "likeliness" here? What model are you using to obtain your result? Or do you really just mean "I really strongly feel that's not possible, but not for any specific reason"?

While I certainly appreciate you chiming in here and there, it's not much use to anyone if you are going simply be dismissive (and in some previous cases antagonistic), without going into why, exactly you believe what you do. One of the main points of the subreddit is to dig into the thinking behind views. Anyway: The standard answer to this question is that you can create "persistent realm" in a lucid dream, which can be returned and which to all intents and purposes behaves as if it is as "real" as this waking experience. In that sense, it is 100% possible to "jump to a dimension where superhuman actually exists" and to "gain Superspeed in that dimension". What is the difference between this and apparently "really" jumping dimensions? I'd suggest that the only difference is that you "wake up" from a persistent realm, but do not "wake up" from daily life - yet, at least. If one switched one's experience to a persistent realm and then never resumed this experience, though...? That would be what OP is asking for. Although such an experience might not actually be much fun "in reality", I'd say.

Here you go again typing an entire paragraph of "words" in "quotes"... he wanted to REALLY jump somewhere fast

Haven't you heard? "Quotes" are the new CAPS!

Expanding on that: The reason I put things in quotes - other than when literally quoting a comment or someone else's terminology - is to highlight that the word or phrase is not to be taken at face value, and that its usual meaning or underlying assumptions are perhaps one of the things under investigation. Your glib comment about being "realistic", for instance, would make a good example. Because how, exactly, are you defining or judging what is "realistic" versus what is not? What's the difference between "really" jumping somewhere fast and having an experience as if they are? Etc. As they stand, in the context of this discussion, your comments are basically meaningless. One of the points of the subreddit is to engage in some philosophy and unpack these sorts of things. This seems to have gone over your head.

As suggested in a previous comment: Treat this as an investigation into the "nature of your experience" (and of "descriptions"), consisting of experiments and subsequent contemplation of the results. You're meant to reach your own conclusions, really...

Ultimately, you are led to confront your assumption that you are a person-object located within a world-place. That is, whether the standard concept that "the world" is a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'" is in fact a completely accurate description of your ongoing experience.

(With apologies for multiple levels of quotation marks.)

POST: This sub feels like what /r/lawofattraction is trying to be

I do think that, as things currently stand, the ultimate perspectives of the two subreddits are quite different, even though from a surface glance they seem similar - and that's why the content differs. They're both seemingly just about trying to change your experience. But here, that's not quite what the underlying purpose is.

Firstly, it's largely about investigating whether experience can be changed, by conducting experiments in order to check our usual assumptions. It just so happens that a good way to do this is to try and get desired results - and this has the happy benefit of you getting something you want, if the result is a positive one. Nothing is to be taken on blind faith. You do have to do the exercises, or there's no point! (Talking about how "likely" something is, for example, is a waste of time; you'll only know how likely something is if you check.)

This is the "practical" part.

Secondly, this subreddit is also careful about taking descriptions and explanations for granted. Specifically, it's cautious about the nature of "descriptions". In LOA-type forums, often we see lots of posts and links about "how the world really works" and various techniques and methods. These are sometimes greeted with enthusiasm as the next "truth". But there is an underlying assumption hidden that there even is a "how things really work", and that a description can get "behind" experience and capture that. That's not necessarily the case; descriptions can be seen as just yet more experiences at the same level (the experience of: "thinking about experiences"). Parallel constructions in thought. This also brings the idea of a "method" into question, and highlights the risk of conflating "conceptual truth" (a self-consistent description who's apparent truth is really structural coherence) and "direct truth" (a fact about experience that you can apprehend directly, such as finding location of "you" in this moment of experience).

This is the "philosophy" part.

Finally, we do have to make a distinction between people "talking within the framework" of the subreddit, and having blind faith about any particular aspect of it. If you are going to take a line of investigation, you do have to put aside caveats and pursue it fully for the duration. For example, "is this-idea-for-an-outcome possible?" is both a practical and a philosophical question. It doesn't necessarily means someone "believes" something in the manner of faith without proof; they are exploring possibilities and thinking through the implications.

Meanwhile, from a relevant thread yesterday:

Treat this as an investigation into the "nature of your experience" (and of "descriptions"), consisting of experiments and subsequent contemplation of the results. You're meant to reach your own conclusions, really... Ultimately, you are led to confront your assumption that you are a person-object located within a world-place. That is, whether the standard concept that "the world" is a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'" is in fact a completely accurate description of your ongoing experience.

No matter what conclusions are drawn, at least from that point onwards the investigator will be living their lives based on an understanding of their experience that has been tested and confirmed, one way or the other.

I find that this sub has a large difference between what the sidebar says its about and what people make posts about. I read the sidebar when I first came and it resonated with what I had been doing, so I subscribed and check it frequently looking to find people into similar things. I rarely find posts here though that are, Imo, anything to do with what I interpret the sub as being about. It's a shame. Tbh I think the name of the sub is misleading and attracts people that believe they're Dr Samuel Beckett. Do you know of any other subs that may be more of what I'm into?

I think the main content of this sub happens in the comments really, as part of an ongoing discussion. The actual posts are mostly a starting point for that. And it's "moderation by contribution" here mostly, so other than the sidebar-linked posts and the overall perspective, there aren't any "official" posts or views. We think that works better for an open-exploration type format.

The subreddit name: Yeah, in a way it can be misleading if taken at face value, and to an extent it's a historical artefact, but it should really be taken as a provocation, I'd say - a challenge to investigate. Posts based on assumptions about the name sometimes lead to good unpacking-type conversations. If I were setting up a new subreddit, though, I'd choose a different name (although probably not one that was much more straightforward).

Like most public subreddits, it's inevitable that it doesn't get to stray too far from a certain introductory level because of new arrivals and the difficulty in developing a strand of thought over a prolonged period (see: /r/luciddreaming and so on, similarly). So this place is always likely to be a transition between one thing and another - but that's fine, I think.

There's also the issue that, in fact, after a certain point there's not really much more to say. To quote Alan Watts slightly out of context, there's an element of: "If you get the message, hang up the phone." The "posts as seeds" and the level of ambiguity here is actually one way of allowing the perspective to shift around, and different angles to be taken on the same underlying insights and concepts.

Anyway, as regards other subreddits to check out, depending on your angle, /r/oneirosophy is one possibility and, for a more curated experience, perhaps /r/weirdway. If it's a more formal philosophical discussion of this you're after, or something more about metaphors and mental processes in terms of perception, there's nothing I've found that's particularly great.

Care to expand on the themes of "what I interpret this sub as being about" and "what I had been doing"?

I don't want to call acceptance of these principles "blind faith," but I'd suggest that contemporary empiricists have acknowledged that accepting these principles largely uncritically allows us to ask more interesting, and more sophisticated questions, by standing on their shoulders.

Indeed.

It's not "blind faith" - or should not be - though, because one isn't really proceeding as if the principles were "true" so much as they are useful. If they stopped being useful, you could just ditch them. And there is no reason you can't simultaneously use other principles, even ones which directly conflict with the favoured set, if that works for a particular circumstance (drifting more into Paul Feyerabend here than Popper, I guess).

Conceptual frameworks might be said to be largely "castles in the sky" - more self-consistent than they are actually consistent with direct experience, other than a subset of somewhat artificial elements we call "observations". These "observational touchpoints" are the threads which link description to experience, but even the formatting of linkages is itself an abstraction, a set of hidden assumptions - ones which potentially pre-filter lines of enquiry, if we are not careful. And so:

Science is perhaps better viewed as a loosely overlapping collection of frameworks and strategies, rather than a single "knowledge" or "method" - even though it is rarely represented as such in everyday, even professional, discussion.

And, very loosely speaking, the sort of "meta-strategy" that this implies is the (ideal) overall angle of the subreddit, with perhaps one addition: that the nature of observations in terms of the direct experience be included. That is: "truth"?

POST: I'm so confused

I read that it's [dimensional jumping] some type of metaphor. So if you dimension jump from 'poor' to 'wealthy' would that just change your state of mind to work harder to get wealthy? Or would your whole reality change and you will automatically be getting more money?

It's a metaphor in the sense that it's a particular concept for describing an experience. That is, you might have experiences so discontinuous that they are "as if" you have "jumped dimensions". In that case, the experience is literally true, but the description is a metaphor - since you don't actually experience "dimensions" as such. It's just that the experience is consistent with such a concept; other descriptions could equally apply to those experiences too. In other words, descriptions are never "what is really happening". They are, in a way, also experiences: the experience of "thinking about experiences".

Anyway, the ultimate point is that the direct experience is primary; descriptions do not "cause" experiences and are not "how they work"; descriptions are secondary. However, it might be observed that intending something in terms of a particular description might "pattern" your experience to be consistent with that description. (This is still not the same as the description being "true", however.) This can only be explored through personal experimentation, though, so you must begin by doing the exercises in the sidebar, and see what experiences you have.

At this moment now, you might say that you are having an experience consistent with or "as if" you are a person-object located within a world-place. And you generally think of that "world" as being a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'". But also you might say that this is not actually what is happening.

What is happening - you might consider - is that you-as-experiencer has "taken on the shape of" the experience of apparently being a person in a world - that you-as-awareness has taken on the shape of a 3-dimensional, multi-sensory "moment". The description of what that moment is and its content, that is in parallel or simultaneous with that sensory moment: it doesn't get behind it.

And so, again, the description is a metaphor, but the experience is literal. The description is a metaphor because it is a conceptual construction, as a parallel experience, which tries to replicate certain elements of the experience to make it thinkable, but that doesn't mean the description points to just a "state of mind" (in the way you mean it anyway). Part of the fun of the experiment is to explore how valid your everyday descriptions are, in the face of the direct experiences you can generate!

This includes your descriptive ideas of "your own perception", "other people" and even the broader concept of "reality". You may find that all of those terms have hidden assumptions which will need to be unpacked, as you progress. For example, you might consider in what way "other people's reality" is actually experienced by you. And, in fact, to what extent you truly experience "a reality", given that this concept sort of implies a "place" that is somehow external to you. Do you experience something external to you? If you think so, then in what way exactly? And so on.

Meanwhile, perhaps try out this little exercise for fun, to give a sense of what a shift in perspective would be like on this:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

Q: Do you experience something external to you? If you think so, then in what way exactly?
What attitude/mindset do you suggest as an alternative to the natural materialistic "modeling of things (to better predict their behavior (and profit from that))"?
When you can't control something (i.e. - when you observe a mismatch between parts of what you're experiencing and what you'd prefer to experience), what's your first thought? How is your perspective different from the classic "there are those things out there, beyond my fingertips, I can't directly govern" ?

So, the possibility of control is a secondary thing, really.

That is, that noticing that the entire moment of experience is "made from" you, is within and as you, is the primary thing, the basic aspect of your experience. It is the only fundamental property of it: the property of being-aware or "awareness", the context to all experiential content. This noticing can be direct (look and see that it is so) or can be approached indirectly (by participating in exercises and finding that your standard description, involving a "you" and "world" separation, is inaccurate, and following where that leads).

Now, this fact suggests that your experience is better thought of as "patterned awareness", because it is the case that there are no inherent parts to you-as-awareness, no inside or outside and so on. This is true regardless of whether you can effect change or not. Even if your current main strand of experience just continued "on rails" and could not be adjusted, it would still be true that it was not external to you. It's not "beyond your fingertips" because you don't have fingertips, you merely "taken on the shape of" the experience of apparently having fingertips and there being things beyond those fingertips.

However, it is worth noting that the "you" we are talking about here is not the personal you. Following from the above, the personal you is actually a formatting of experience. You are not a person, you are that which takes on the shape of an ongoing moment of experience which is formatted "as if" you were a person. Right now, you-as-awareness have "taken on the shape of" this 3D multi-sensory moment of apparently being "over here" and the room being "over there", but quickly you can perceive that it is all "you". So, when you move your arm, you are not a person moving an arm - rather, you are patterning you-as-awareness with the fact of "my arm is lifting" and subsequently that is unfolding as a sensory experience, with the entire sensory moment being "you".

This leads to difficulty discussing "causing change", of course. Because you don't really cause change, so much as "become" a new state or pattern which consists of the desired experience as an aspect of it or implied fact within it. And there's no "outside" to you - no separation between you and result, no "doer" and "done to" - so you (as patterned awareness) either have changed, or you have not. (Note that this "state" isn't describing just the sensory moment, it's the entire set of facts within that moment, which imply all subsequent moments - until you shift state again.)

You can't try to change state, for instance, because that would just be patterning yourself with the experience of "trying". This might be taken as a suggestion that, if you don't experience the outcome that you wanted to experience, then you did not in fact intend for the outcome, but instead intended for something else. You might have thought that you were intending for your outcome, but further investigation will show that you did not.

A mundane example: you want to improve your posture, but instead of actually intending to "have relaxed ideal posture" you instead in fact intend to "tense my neck upwards and push my shoulders back" because that is your conception of what "good posture" was. Another: you are in an arm-wrestle, but instead of intending to "have my arm be over there in the winning position" you in fact intend "to tense my muscles and thus generate a feeling of power and effort", which actually opposes the movement towards the winning position.

So, getting to the conclusion at last: one way to think of apparently lack of ability to control is that you are tending towards intending or re-implying your misconception of the world - intending your inaccurate description of experience - rather than actually intending the outcome. Which is why there are no "methods" or "mechanisms" to suggest for this, and it's ultimately actually all about exploring and unpacking one's own patterning?

But, you're actually changing a situation in your own reality right?

It's a bit of a tautology, that. If you are changing your own ongoing experience, then you are changing "your own situation in your reality" - because what is a "situation" or "reality" or "experience" anyway? They are the same thing. It is only the use of particular concepts that introduces the idea of a separation between those things. You never actually experience a separation as such.

As for whether you are "actually" switching dimensions, the thing to consider is: how would you differentiate between having an experience "as if" you switched dimensions (that is, an experience consistent with a description using the concept of "dimensions") and an experience of "actually" switching dimensions?

This is why the subreddit ends up being an exploration of both the "nature of experiencing" and also the nature of descriptions about experiencing. We take a step back from it all, and consider what we truly mean by these things.

To an extent, the name "dimensional jumping" is somewhat of a provocation. It asserts the idea of "dimensional jumping" and challenges you to have experiences consistent with that idea. If you then do have experiences consistent with that idea, does it mean you "actually" jumped dimensions? Or does it mean something else, something more fundamental? Does it perhaps imply something about your everyday notions about what "you" are, what "the world" is, and the relationship between the two (and if there is two)?

Or would you be able to plan things to happen for yourself by doing dimensional jumping?

The short answer is: there are no answers, other than just doing it (in the spirit of exploration and experimentation).

POST: Two glasses - Tell me about your experiences...

In the spirit of digging into things for increased clarity:

I actually did not intend it to make me change universes, merely re-pattern me to be better an manifestation

What's the difference between "re-patterning" and "changing universes", though?

And: how do homeopathy and "vibrational medicine" work, and how is the two glasses exercise related to that? What is "energy/intention" stuff exactly, in that context?

There's a risk, here, of bouncing phrases around without connecting them properly to the actual experience, or perhaps reusing metaphors ("universes", "energy" and so on) that are sort of "too late" when it comes to accounting for these experience. That is, assuming that concepts which are foundational in the "standard" or even "new-age" descriptions, which are not in fact foundational to our actual ongoing experience, given fresh experiments and their results here.

For example, most of those descriptions do in some sense still assume the model of being a person-object located within a world-place (where "the world" is a "stable simply-shared, spatially-extended 'place' unfolding in 'time'). I'd say that one of the first assumptions to fall under suspicion should be the "I am an object located in as space" one, and with that removed, you have to approach everything not in terms of content, but in terms of overall context.

Triumphant George, may I ask you something... If you do not want to reply on list and just to myself, that's cool. But do you believe that things can be made to change? I am talking about can into dog or Nissan into Mercedes type change (and experienced by sane people not schizo's), and not in a forward looking "my cat will die, my Nissan will be stolen but I will be given a dog and a Mercedes" kind of way, but in a reality breaking/bending/rewriting kind of way, weather it is retroactive or a "poof" there it is? Because if you are of the opinion, even covertly, that "jumping" is only good for soft or future changes, things that are not classed as paranormal and are at best unexpected, then we are talking at cross purposes. Because I can't really work out if you are so connected to conventional reality you don't think these paranormal changes are possible and your philosophy is more of an attempt to turn the practice into a therapy, or if you are totally the other way and are so disconnected from material reality that you think anything is possible. Maybe if I had read more of what you have written I could answer this clearly, except if you are being covert about it, maybe not. You have what seems like rationality that I would expect to find in a skeptic, but the view of a mystic.

Not therapy - although of course anything that clarifies might also be therapeutic as a side effect - and it's not about "believing" things. Rather, a rational investigation into the "nature of experiencing", and also the nature of descriptions about experiencing (or just "descriptions" in general). But pursued from the ground up. That is, all assumptions fall under the wary eye, be they "standard perspective" ones or "mystical" ones. Direct experience, then build out (but noting the context if experience not just face value content).

The notion that we are a person-object located within a world-place, for example, might fall under investigation sooner rather than later given some results, but it is not then replaced with another description of the same type: swapping "people and places" with "consciousness and energies", and taking them literally, is perhaps to repeat the same mistake - and so on.

The subreddit itself deliberately takes no official view. First, because it's all about personal investigation. Second, because that turns out to be a somewhat nonsensical phrase (an official view wouldn't have much to say, in a way). Instead, it adopts a "meta" perspective where nothing is taken to be fundamental - except, implicitly, the basic fact of experiencing (that there is experience). I'll try and reply to your other extended comment soon, but meanwhile: in terms of exploring the context of experience rather the content (this doesn't just mean "sensory content"), and considering where a "meta" perspective might fit in, this silly little exercise is worth playing with and then pondering. Note that actually doing it is different to thinking about it, though, and in fact that is part of the point.

Q: But how do you know it's a mistake? I appreciate it might be your philosophy, but how do you know your philosophy is correct?

But how do you know it's a mistake?

It's a mistake in a different sense than you probably mean here:

I appreciate it might be your philosophy, but how do you know your philosophy is correct?

It is not "correct". No description is.

Descriptions are merely useful. As a framework within which to discuss experiences, or they point the way to an insight or experience. Or they don't. Beware the "reification of abstraction" and all that. Descriptions aren't true. That is, beware taking concepts as external things, specifically assuming that descriptions or philosophies "get behind" experience, rather than themselves being experiences (the experience of: "thinking about experiences"). Implicitly, that would be equivalent to saying that the description "causes" the experience. For example, that "gravity" causes things to fall down, rather than being, loosely speaking, the name of a description of - a codification of observations of - "things falling down".

Now, even though it might be suggested (subject to experimentation) that adopting a description in a certain way may lead to experiences "as if" the description were true - something we might call "patterning" - those descriptions themselves never actually "explain" experiences. The description still wouldn't be "what is really happening".

I think the little exercise makes the distinction clear, as a starting point anyway. One thing that is important here is that we don't just get lost in little "castles in the sky" that lack many "observational touch-points" - that is, self-consistent thought structures which are coherent but don't actually connect to direct experience, except very minimally. We need to distinguish somewhat between models and things which are vague and therefore operate more like a narrative or language. (I'd suggest that, as generally used, concepts like "energies" falls into the latter category.)

=But you said mistake, I just asked how it was one? The point I want to make and which I would be interested to hear back from you about is that I believe that a group of people doing this together might, whether for energy/intention or psychological reasons (not feeling it is all on them alone) be more powerful than doing it alone. I also think that having the memory of when it was that way should make it easier to re-establish that pattern and shift much as I believe occurs with flip flops in the Mandela Effect where these are things that people tend to be dramatically more absolutely certain how things are and yet a shift back to how it used to be still takes place. So even in your understanding of how this works, shouldn't this be a novel and likely enhanced method?=
=

It's a mistake in the sense of taking a conceptual framework as being literally, independently, causally true - taking a description as being "what is really happening". (Unless I've lost the thread here. I interpreted your question as asking me why adopting "consciousness and energy" as a description would be the same mistake as adopting "objects and places". The mistake is to take either as being fundamentally actual or true.)

I agree that having a memory (or any conception really) of something can make it easier to establish or re-establish that pattern as prominent in subsequent experience. It's necessary, even - or at least, if it is no directly conceived of, it must be implicit in what is conceived of.

However, the problem with "a group of people doing this together" is that there aren't any people, and that you aren't a person either - in the sense of being a person-object having an experience. There is a person-formatted experience happening, but that is to say a different thing. Since there are no independent people in the sense of beings, and they have no separate power or intention of their own, then talking of a "group of people" doing anything - doing anything - is ultimately meaningless. Except in one sense:

It would be possible to have an experience "as if" you, as a person, get together with other people and do some sort of ritual and then experience an outcome that is much more intense than that which accompanied your experience "as if" you were a single person doing this alone.

Still, though, the entire experience of this group activity would in fact still be "awareness" just "taking on the shape of" the experience of apparently being a person in a world, with other people, doing this ritual and getting results. In actuality, the entire experience would be a "result", and all the doings and activities merely a sort of "sensory theatre".

Aside - The lesson from that exercise is that there is not "an awareness" or "the awareness" or "awarenesses". There is just "awareness" - unbounded and without inherent structure, which "takes on the shape of" situations and, therefore, moments of experience. (It is "before" division and multiplicity; those are also patterns taken on by awareness; this is why it is not solipsism.) You can notice right now, directly, that this entire moment is "made from you" and that there is no outside to it, or an inside for that matter. Furthermore, you can't find you-the-person anywhere within experience, and any thought you have about the experience or being-a-person are themselves simply further experiences, within-and-as "awareness". The ultimate point being, yes you-as-awareness might taken on the shape of being-a-person-in-a-world-with-other-people-and-doing-stuff-together, but it is a sort of "patterned image", with the all the content of the image being a "result" from the perspective of the context of it. This context is the only "cause", and even then it is more like a "self-shaping" than a cause-and-effect type cause.

But isn't that just your conceptual framework?

Not really.

First there is a direct noticing of what the fundamental fact of experiencing is - and that is primary. Everything else is just an attempt to convey the implications of that.

Which is why I take pains to say that conceptual frameworks are themselves just further experiences. Basically, you cannot think about this. It is literally unthinkable, because we are talking about "that which thinking is 'made from'" - or indeed, that which structures or patterns are "made from". You can't use conceptual structures to talk about pre-structure. However, conceptual structures can still be useful.

It is inherently the case that there are not experiencers (note the plural and the implication that there are objects having experiences). However, there are indeed experiences. There are just not simultaneous, or sequential, or parallel experiencers or experiencees. Hence ending up phrasing it as "experiencing", and so on.

Now, what difference does that make to the person-formatted experience? Mainly, it means that the patterning of that experience is not fundamental, that there is no world "out there" as such, but most importantly it means that nothing in the content of your experience is the cause of it.

And since you are trying to cause change, that may be relevant.

And what does a "persona formatted experience" really mean different to being a person? Wouldn't it be mostly the same thing?

In content terms, mostly yes. But it means that the concept of a "person", a thing located within a "world", is not an accurate representation of your actual situation, and so that ideas built upon that will also be inaccurate. You may make all sorts of "discoveries" as you have the experience adventuring about in the world, including "transformative" experiences with "other people", but you'll never be uncovering anything deep - just more experiences.

Note that I am not disparaging that! That is what it's all about!

However, since this subreddit isn't just a "self help" forum for generating happy experiences, and we tend to spend time unpacking descriptions and concepts to see how the relate to the nature of all experiences, I'm obviously going to spend some time unraveling our perspectives like this.

The whole last paragraph, you say what I can find, but honestly I have not found any of that, maybe I could, but none of it speaks to me as a self evident truth.

Well, you have to examine your experience, now, directly. Rather than either just think about it, or pay attention to the content of it. It's not an easy thing to convey, and I'm not really trying to persuade you of it - I'm just suggesting that this is something you can do and notice, and that the direct fact of your experience somewhat re-contextualises the content of it. Anyway, just put that on the back burner for now perhaps.

I am at a loss as to how any of this is proven, why it is necessary, or really why it is useful

It depends on what you're after, of course. The ultimate aim of it would be to cease to be delusional about one's circumstances. (That is not meant in a negative way!)

So while I find your ideas interesting, nothing really beats results, and there is one thing I know from fringe physics research, theories be damned when the experiments disagree!

Quite so. As mentioned regularly, success of a "jump" is to be judged by having the outcome you intended subsequently arise within your experience - nothing else counts.

However, that is the start and not the end, because typically (after some experimenting) the results seem to rather break the "standard world" model. And not just in a simple way that can be adjusted for easily - it breaks the model of there being a "you" and a "world" at all. And no fringe physics can save it.

Anyway, you'll notice that the subreddit itself doesn't really offer conclusions, it just sets up a couple of exercises to act as the starting point for personal investigation. The two exercises are designed to potentially offer (eventually, when considered and pushed) two insights into our experience (albeit ultimately two aspects of the same insight).

Let me emphasise though:

This discussion isn't meant to dissuade you from trying out "group experiments" or anything else. We're just spending some fun time unpacking the assumptions implied within that idea.

when I first arrived one guy who followed you for about a year gave up, and I have seen a few others who are frustrated.

Nobody's meant to be "following" anyone! Primarily, because this ends up being about unpacking your own experience, and noticing that the idea of independent "methods" and "techniques", or even a specific "how things work" or "mechanism", doesn't quite stack up. But that is to jump ahead: this is a forum for experimentation and discussion, the only extra bit is this tendency to be doubtful about descriptions vs experience - that "meta" perspective thing.

your philosophy is a total rewrite to reality and not just a fundamental plot twist

Everything stays exactly the same, except for a shift in context.

it says more about what it isn't than what it is

That in the nature of it. It's like:

There's a piece of paper. The paper can be folded in any shape. Now, what shape would you fold the paper into, to represent the piece of paper itself? Actually, the only way to point to the paper itself is to indicate how all the different folds one can make from the paper, are not the paper (while simultaneously they are all the paper, confusingly).

Similar metaphors include: trying to make a sandcastle which communicates the fact of both "the beach" and "sand".

It it wasn't like this, then everyone could just read a book or follow a step-by-step method and become "enlightened" (or whatever you want to call it).

it removes useful tool to talk about things and useful concepts.

No, it simply recognises those tools and concepts for what they actually are.

Side question: In your view, if someone wanted to, could they rewrite reality to the point of arbitrarily redefining the structure of the atom? Not just bending but rewriting physics to however they willed?

Well, physics is easy to rewrite: it's just a collection of descriptions, based on a subset of experiences which were abstracted into "observations". The world is not made from atoms - although "the world" (a particular idea) is made from "atoms" (a particular conceptual framework). Just have a few fresh observations, then make up some new descriptions! ;-)

You need to be more specific when you use the word "reality". It's probably laden with assumptions. Do you mean "the direct fact of this moment of experience and its content", or do you mean something like "this particular conceptual framework". Reality, I'd suggest, is this moment right now. Anything beyond that, is storytelling...

Anyway, it might be beneficial to separate out into strands: this sort of conversation and separately your own experiments and results. (Perhaps better to call them "outcomes", actually, since it's a less loaded term.) Because this stuff we're talking about can be a distraction, perhaps, if gone into too early.

Just bear in mind, though, that "getting results" doesn't necessarily confirm a "this is how things really work fundamentally". That is, the nature of the experience of the results. Always follow any apparent causal chain right down the line, right up to: "referring to my direct experience, how did I cause the raising of my hand in order to wave the magickal wand in this ritual". And keep in mind this notion of the context of all experiences.

After playing with that for a bit, this and the other conversations may not be so jarring, because there will be a better sense of where they are coming from (note: that doesn't mean you'll necessarily agree with them of course!).

POST: [THEORY] Why I think we REALLY aren't getting results

What, exactly, is the "will of nature" though?

Isn't it, ultimately, a fictional construct being used as a black box explainer for describing "why I didn't get my outcome according to my assumptions"? Isn't it essentially a replacement for the "will of God" concept. There, too, we'd end up by asking the question: what is "God"? Here, we might ask: what is "Nature" and how does it relate to "me"?

The risk, here, I guess, is that we end up proposing entities which do not exist fundamentally. We may have experiences consistent with the concepts, in a broad sense, but forget that the description itself is not existent or causal apart from that.

Similarly, what is "human intent"?

If the human experience is itself really just a particular structuring of "awareness" (or "experiencing"), then it makes no sense to talk of "human intent" - because "human" is a certain formatting of experience and a certain description of that experience. "Human" is not a being - and that which experiences and intends is itself not human. It loops back to questioning the more fundamental assumption of being a person-object located within a world-place, which the "will of nature" concept implies again.

Now, taking a step back, it is certainly true that our ongoing experience is structured. It's not just a random whirlwind of disconnected multi-sensory image fragments. What is the nature of that structure though, and to what extent is it fundamental? If one supposes that there is a thing called "Nature" and that it has a will independent of you-as-awareness, then one must consider what the nature of that "Nature" is. What it is "made from" and how it interacts. More importantly, what is the evidence of it in direct experience?

We risk swapping one (alleged) superstition with another, except labelling one description as "really what is happening" compared with the other (even though neither is more fundamental). The very idea that there is a "what is happening" behind the scenes at all, as it were, is potentially open to question. In which context I would add:

But the claim is made that we are outrageously free and in principle can have anything that we desire, that only our beliefs or the action of our subjective minds holds us back, that all possibilities are out there, and all you have to do is call them to you.

This seems more like a summary of the "law of attraction" concept and not what is being explored here, surely. That's the sort of thing that is being investigated, not claimed.

All the important questions are functional ones, having a bearing on shaping results.

The problem with sticking with functional questions, is that the very nature of "doing" is also under investigation.

So, in essence I'd still say that you are simply describing the fact that one's ongoing experience is structured, is "patterned". I would not disagree with that. That is certainly true in direct experience.

However, introducing the concept of the "Will of Nature" doesn't add anything further to that observation, I think. If the properties of the "Will of Nature" are simply identical to the observation that "experience is patterned", and that simply "wanting" something doesn't instantly modify those patterns, we aren't gaining anything in terms of insight. Except, because of the implications of the term "Will", the notion that there is an independent "power" or "purpose" which shapes our experience. This is something more than saying it is patterned.

What is the functional, the practical use of that description?

Note: I definitely agree that descriptions in and of themselves are not necessarily valuable. But it is not clear that the concept of the "Will of Nature" goes beyond that either.

I no longer think those are actually much useful as questions.

They are useful because they unpack the relationship between descriptions and the nature of (as distinct from the content of) our ongoing direct experience. More importantly, they force us to examine the relationship between ourselves and our experiences - if indeed there can be said to be a relationship, even.

You are still left with a particular structured description, implying the actual existence of something called the "Will of Nature". Now, it may not be your intention, but implied within you description is the concept of "you" being in some way embedded within some sort of a structure, a structure which is independent of you and imposes itself upon you.

Is that what is actually experienced?

In my opinion, the will of nature exists fundamentally... what I am calling the actions of nature.

In what sense, though does nature "act"? By saying the "Will of Nature" is fundamental, are you simply trying to convey the idea that some of our experiential patterning cannot be modified?

Therefore patterns act upon us which are not malleable simply by a change of notion in regular states of consciousness.

But - is this not just a restatement of the idea that you can't change the more abstract or factual patterning simply by "wanting" or "wishing" (whatever those are, exactly)?

We'd then ask: What is a "state of consciousness" in this regard and why would it make a difference? What is a "deep technique" or "remote state": deep relative to what, remote relative to what? How do these relate to the "Will of Nature"? Is it a battle of wills, a power wrestle between entities? Without asking those questions, then our concepts aren't functional, because they don't suggest anything to "do".

If you contest this, show me someone able to conduct a conversation without a heartbeat.

How does this connect to the idea of the "Will of Nature", though? That still suggests it is a black box explainer for "anything you cannot immediately do".

I think there is a false binary that we are free to change things or we are not. I think at a very deep level we may be free to do so, but I don't think that level is trivially accessible.

So, I didn't see a false binary there, because that wasn't being asserted (that we are free to change things or we are not).

What you are saying - a useful insight though it might be - still seems to be little more than "we observe that experience is patterned and we also observe that we can't simply update the broader patterning by just wanting-wishing". I think the introduction of the "Will of Nature" and the other stuff simply clouds this. Why go beyond simply saying that there is a "patterning" to experience, and that some patterns seem more easily modifiable than others?

The questions would then be:

- What is the nature of "patterns" and "patterning" (what does that concept point to)?
- What is the relationship between "patterns" and "the world" and "you", and:
- Why are some patterns seemingly more easily modified than others?

Ultimately, then, probably my main issue with your concept is that it doesn't actually explain why someone "really" doesn't get a (particular) result or finds they apparently can't change their experience instantly; it simply restates it in different language whilst potentially introducing something that implies additional entities and relationships that can't be tested (or more: aren't required or useful).

...

So, I'm struggling a little here. After all that, I still don't think you've added anything to the basic statement: "experience is apparently patterned and some patterns seem remarkably persistent". Except, perhaps, with the addition of the idea of a "cosmic agency" or "will of nature" that you must in some way be "aligned" with in order to make significant changes. But then, that itself would just seem to be a synonym for the patterning of oneself as "that which takes on the shape of states of experiences". (When I say "oneself", I of course don't mean human self, since "human" here would just mean a certain patterning of experience: "human" isn't a being, it is formatting of being, in such a description.)

Perhaps we are talking at cross purposes here, though. And so:

To try to get us on the same footing - because it may well be we are sort of talking about the same overall concepts, and I actually feel we almost are in one particular way, if I could get you to articulate it more concisely - in your description, or indeed in your experience:

- What is "the world"? What are "you"? What is the relationship between the two? And:
- What is the relationship between the "will of nature" or "cosmic agency" and that? What is the relationship between your direct experience right now and that?

Without this, to me, it feels as though there's a nice phrase, something somewhat attractively romantic even - the "will of nature" - without anything actually behind it, that we can connect usefully to direct experience.

Q: *So, I'm struggling a little here. After all that, I still don't think you've added anything to the basic statement: "experience is apparently patterned and some patterns seem remarkably persistent". Except: Perhaps with the addition of an idea of a "cosmic agency" or "will of nature" that you must in some way be "aligned" with. Perhaps we are talking at cross purposes here, though.*

Correct. *The very reason that they are "remarkably persistent" is that they are extending from an agentic source that is not empirical "you."*

To try to get us on the same footing - because it may well be we are sort of talking about the same overall concepts, and I actually feel we almost are in one particular way, if I could get you to articulate it more concisely - in your description, or indeed in your experience: What is "the world"? What are "you"? What is the relationship between the two? And: What is the relationship between the "will of nature" or "cosmic agency" and that? What is the relationship between your direct experience right now and that? I really don't know why you would feel that asking and/or discussing questions like that are going to help you achieve results, given that I've already said that any actions we undertake from the waking state are likely to be minimally effective from the get-go. Discussing, defining, philosophizing etc are all "waking state centric" activities, and therefore, imo, the very things likely to have the least possible effect of all activities one could undertake. I sincerely believe you are likely to have more success dancing wild around a campfire at midnight dressed as a stag...and I mean this, especially if you are in an ecstatic trance. Indeed, this is not new of course. Practitioners of magick (who have been doing for hundreds of years what LOA practitioners etc appear to believe they invented recently) have said for ever and a day that altered states of consciousness are the key to the efficacy of magical action. So in OPERATIONAL or FUNCTIONAL terms (sorry to keep carping about it) your questions are literally not the right ones, or the important ones. The kind of questions that are the important ones shift register, and take on shapes such as these. Q: what can I do in a profoundly altered state to make sure that I can at least retain enough memory or control to remember my intent...without destroying the state itself and returning it towards the waking state? Q: How can I most effectively attain such a state in the first place? Q: How can I work with specificity in such a state if I appear to no longer have a "self" there"? And so on. THESE are the kind of questions that matter!

Okay, great - with that stripped down a bit, I'm now a little clearer on where you're coming from, and can probably articulate my perspective on it a little better, in way that will make more sense to you. (More later)

I'm not sure it's a case of "not making sense" to me. Many potential views about reality (or the lack of it) can "make sense" in a self-consistent way, but at the end of the day, I reckon some of them are just more likely than others. That 'empirical you' is the only source of agency is, for instance, extremely unlikely imo.

I agree about the self-consistency point, as regards descriptions. However, I really meant it more in the sense that some of your prior responses, particularly the more general responses, suggested to me that I hadn't gotten across what I had intended to. For when I pick up on this, could you clarify what you mean when you use the term "empirical you"?

Q: *So I have a sense of myself as a limited being grounded in a world. That being has boundaries to its nature and its actions which I can't dispel just by wishing them dispelled. I can't point to the Empire State Building and have it take off like a rocket, for example. I can't grow another arm if I lose one in an accident. This inertia in the system is not explained if you are the only agency, and are entirely free. If I declare myself to be entirely free, and yet I still find myself NOT to be entirely free, then something acts upon me. Therefore there is something other than "me" and which might as well be called the World, or the will of nature.*

So, let's pick this up again. At the outset, though, I'd suggest that your original post perhaps slightly misunderstands the nature of the subreddit and what is meant by "dimensional jumping" in this context. But that doesn't necessarily matter for digging into what we are discussing right now - we can come round to that later, since it'll follow (ahem) naturally.

In short, it is conceived of as an investigation rather than a method or literal description - which is why the demo "exercises" are labelled as such, rather than as "techniques". This is also why discussion like this are prevalent, rather than just "what is the best way" - because ultimately the very idea of there being "a way" or a "how things work" doesn't entirely hold up to scrutiny. And in fact, the very notion of a "description", and its relationship to one's experiences, falls under scrutiny too of course! (The link I included in one of the earlier responses was intended to clarify this: this isn't meant to be a "law of attraction" type of a deal.)

Anyway, on we go:

So I have a sense of myself as a limited being grounded in a world.

Can you describe that sense of yourself as a limited being more clearly? What leads you to draw the conclusion that you are a being (which I'm interpreting from your language as describing a sort aware observer or person-object located within a world that is like a place-environment)?

That being has boundaries to its nature and its actions which I can't dispel just by wishing them dispelled. I can't point to the Empire State Building and have it take off like a rocket, for example.

What do we mean by "wishing" in this context? I'm not sure that there's necessarily an expectation that "wishing" can bring about changes. Do we mean something like "wanting" or "willing"? And again we'll have to be clearer about what we mean by this. When one "wishes", what are we actually doing? (And there's the problem, too, that people tend to mean different things by words like "willing" and "intending" and so on. We'd benefit from clarifying this by articulating the actual experience of these.)

This might seem to return us to the idea of "functional" - this 'wishing' doesn't always work so what does? - but we'd have to be careful because it's not clear that any action is a cause of an experience. The experience of "wishing" - and indeed anything else that seems like an act or "altered state" experience, that you sense "me doing this" - might be just another result, another experience. While an act may or may not be followed by a desired outcome, it's not clear that the outcome and the act are causally related, other than within whatever description we have adopted. And: what causes the act, since the act is itself another outcome?

If I declare myself to be entirely free, and yet I still find myself NOT to be entirely free, then something acts upon me.

Not necessarily. That presumes that "declaring" (or what you mean by "declaring") has any causal attributes, rather than itself simply being a result, an experiential outcome, of... something.

Therefore there is something other than "me" and which might as well be called the World, or the will of nature.

My problem with this, is that when I go looking for a "me" in my actual experience, I don't really find one. For sure, there are various sensations and suchlike, and the occasional thought, and the sensations and thoughts that appear most regularly I might refer to as "me".

However, the only thing that actually persists is the fact of "experiencing" or "awareness", and not any of those sensations or thoughts. This "me" of experience seems to have no particular location, it's more like a sort of unbounded void-presence which "takes on the shape of" my experience - including the experience of a perspective, with some sensations apparently "over here" and the room apparently "over there", but all of it me-as-awareness. And so, in fact, "me" and "my" is essentially meaningless now, in this context.

And I don't find a "world" either, in the sense that it is normally conceived of, for the exact same reason. There is a "world" in the sense of a certain description or conceptual framework consisting of varies ideas about this main strand of experience, but it is itself an experience - the experience of "thinking about experience". And it is at the same level; it does not get "behind" my main strand of experience and explain it in some deeper sense.

In fact, it turns out there is no place for any "me" or "world" to be, as described in the usual standard description, because there is no "outside" to this experiencing.

Hence, to talk of an "empirical me" other than as a conceptualisation, and a "will of nature" acting upon it, whilst perhaps useful for conceiving of, say, intentional change, is not good for pointing at the nature of that change of of experience. Unless carefully understood as such (a useful pattern which might be overlaid but is not fundamental), it involves introducing fictional entities that not in fact experienced - although one might have experiences "as if" they are true. (This final point, in fact, is the real problem: adopting a certain description and intending in terms of it, tends to bring about experiences consistent with it.)

So, in case that got a little meandering, I'll bring out the key points as being:

- Direct experience does not support the idea of a "me" located within a "world" or a "will of nature" imposing upon it.
- The idea that "wishing" or "declaring" should bring about change - and that it not doing so is indicative of some external agent and/or a division in experience - is problematic unless we are clear about what "wishing" actually is, in the context of direct experience.
- Introducing the concept of "will of nature" tends to obscure the nature of experience and change rather than clarify it - unless it is simply a romantic rephrasing of the observation "some patterns seem more persistent" and is recognised as such.

Aside - You brought up "altered states of consciousness" in a previous comment too, but I've set that aside for now because I think it fall into much the same format as the above, and unravelling will tend to give insight as to the other. While we might talk of "functional" approaches, if it turns out that there is no "me" or "world" in the sense of independent objects, then the idea of an "operation" that one can perform upon the world is already "too late", at least if we are viewing it in terms of so-called tools or techniques. The meaning of "functional" will not be the same after such a shift in context. Similarly, the idea that the phrase "you create the world" is meant in a personal deliberate way also changes - removing the requirement that there be some independent external being or entity deliberately creating things because "hey, I didn't do it". The situation is more like an eternal landscape that is "made from" being and which occasionally shape-shifts into different state-topologies (all metaphorically speaking), rather than a spatiotemporal environment where objects are explicitly invented by beings.

I've come to the conclusion that "reality" is closer to how those who follow Pantheism see it. Everything comes from, goes back to, is a part of/expression of one universal creative "is-ness". And as different as we all are, we're all just bits and pieces of it...having our own experiences, viewing reality from various vantage points. So, you aren't "God"...rather, "God" (if you even want to use such terms) is you. There is an actual fundamental difference between the two ways of thinking.

So, I'd take the general idea of Pantheism but push it a little further than is normally the case. There, one tends to conceive of it suggesting a world which is still 3-dimensional and extended, containing objects, and those objects are "parts of", what you might call "God", and they are having experiences. (I know this is a matter of debate often, but I still find it to be the default impression: a half-step been panpsychism and non-duality.)

I'd take this a step further and say that it is experiences that are "made from" God (or whatever). Not objects and spaces. Again, too, this isn't quite the same way of thinking.

And then:

"God" is you and you are "God", but only in a very particular meaning of "God". We are not talking about an entity God here, not a being. Rather, simply "being". The experience of apparently being a person is "made from" God, but there is no "you" that is an object, a being, that is God, nor is God a sort of being which has taken on the shape of an object. Rather, "God" is what experiences are "made from".

And so, we end up saying best-effort things like (excuse pasting from a previous comment for efficiency) describing "God" as a sort of "non-material material":

[We might say that the] only fundamental, permanent truth is the fact of being-aware - or "awareness" - with everything else temporary patterning on an "as if" basis. Rather than a person with a subconscious who is sending out requests into the world, you are more like a "non-material material whose only inherent property is being-aware or 'awareness', and which 'takes on the shape of' states of experience, states imply and define all subsequent sensory moments". Right now, for example, you have "taken on the shape of" apparently (on an "as if" basis) being-a-person-in-a-world. Meanwhile, this means that any so-called "magick" is, despite any theatrics that go along with it, a self-shaping of oneself into a new experiential state. All apparent entities or techniques or other causes that are experienced are just aspects of that state: moments as "results".

In this case, we don't have multiple "beings" having different experiences, and nor do we have a single being having multiple experiences (the idea of a "single being" is nonsensical here anyway). The only thing that is ever "happening" is this experience right now, and we can't really talk of simultaneous experiences or sequential experiences from different perspectives, because an experience does not occur in time (time is a patterned aspect of an experience).

Interestingly, we end up here trying to construct descriptions which avoid saying things that are incorrect, rather than trying to capture the truth of the matter as such (because "non-spatial" and "non-temporal" things can't actually be conceptualised).

POST: What does this sub think of DMT?

A1: Having a lot of experience with dmt and minimal experience with 'jumping' , I thoroughly believe it could be used as a powerful tool for this purpose. How? That I can't tell you. I've been doing a lot of work/play with mirrors and psychedelics lately and I can't help but think thead experiences are related.

A2: I think it relies on the theory that consciousness is the fundamental stuff of nature. This concept has been pointed to by ancient philosophies, such as taoism and buddhism, as well as certain interpretations of modern quantum mechanics. The idea that all is made up of waves, existing at certain frequencies, isn't new. We know certain patterns of vibrations compose atoms. Further, it seems 4% of the universe is made of our periodic elements - the rest is labeled as "dark energy" and "dark matter." Which we know nothing about. If all is vibrations, frequencies, and interactions, then it would make sense that the brain is a receiver of only a narrow range of frequencies. In fact, we know this to be true in some regards: we see only a narrow range of frequencies of light, giving us our visual spectrum. From this, could it not be possible that our brains can temporarily tune into different frequencies of consciousness? This is the idea, anyway.

I think it relies on the theory that consciousness is the fundamental stuff of nature.

I think we perhaps have to delve a little deeper than that, to make the necessary connections. We need to make a distinction between a "view from nowhere" description of the world (a fictional 3rd-person picture), versus one which links to direct experience. So:

It is not so much that "consciousness is the fundamental of nature", in the sense of it being a material from which three-dimensional worlds are made. Rather, it is more that there is consciousness (or "awareness") and that this consciousness "takes on the shape of" states of experience. A state of experience being a full definition of all contribution facts and patterns to ongoing experience, all implied moments, now. A "dimensional jump" is really a change of state, not a move to another place, and you are not an object, although you might take on experiences "as if" you were.

So, "brains" don't do anything, because there is no such object really; and things are not made up from vibrations, frequencies and interactions. We might have experiences which are consistent with descriptions constructed from those concepts, but the experiences themselves are simply "consciousness". (And in fact, descriptions are themselves just experiences: the experience of "thinking about experience".)

From a previous comment in response to a post about astral projection, magick and the subconscious:

[We might say that the] only fundamental, permanent truth is the fact of being-aware - or "awareness" - with everything else temporary patterning on an "as if" basis. Rather than a person with a subconscious who is sending out requests into the world, you are more like a "non-material material whose only inherent property is being-aware or 'awareness', and which 'takes on the shape of' states of experience, states imply and define all subsequent sensory moments". Right now, for example, you have "taken on the shape of" apparently (on an "as if" basis) being-a-person-in-a-world.

Meanwhile, this means that any so-called "magick" is, despite any theatrics that go along with it, a self-shaping of oneself into a new experiential state. All apparent entities or techniques or other causes that are experienced are just aspects of that state: moments as "results".

A DMT experience, then, is simply another experience. The reason it seems noteworthy isn't to do with the experience itself as such, more that it clashes with the assumptions and properties of our usual description of "the world". That is, that we are a person-object located within a world-place, where "the world" is "stable, simply-shared, spatially-extended place unfolding in time". This, however, is never true; it's just that we are rarely drawn to notice the inadequacy of that formulation, or are dismissive of experiences that don't fit into it (because we treat the description as primary, and our experiences as secondary, even though the description is itself a sort of experience at the same level, as noted above).

None of this is intended to be dismissive of the DMT experience. It's simply to highlight that its value (other than enjoyment) is to draw attention to our flawed assumptions about everyday experience, rather than because it is, say, some sort of "higher consciousness" special experience. (It is not: consciousness doesn't have "levels".) The same can also be said of "void" experiences, "enlightenment" experiences, and the like.

Q: Off-topic but, what do you think about non-duality? let's say Advaita Zen and the like

So I'd say that most things, in some way, point to the same insight, even though the descriptions then tend to get mangled later. That is, everything is patterns of you-as-awareness, and although you might have an experience of division ("as if" there were division), experience itself is not divided. And "non-duality" is perhaps a better pointer than most, being somewhat more modern with less cultural baggage than some.

However, it sometimes seems that some strands tend to get bogged down in language contortions, particularly the "neo" stuff, in an attempt to avoid saying anything wrong. Personally, I think that embracing things like metaphor as a part of and shaping of experience, doing so knowingly, is a better approach than avoiding it. That is, as part of our investigation into the "nature of experiencing", to also tackle explicitly and head on the nature of descriptions. That frees us up, I think; it makes it more experimental and playful.

Ultimately, it's the case that there is no description or method or technique or even a "how it works", so it is in some ways pointless to feel around for the best approach, or compare approaches. I kind of like to think that the angle this subreddit takes admits this from the outset - and benefits from that by taking an explicit "meta" view on experiences and descriptions, so that no one experience or description is taken to be "it" (but rather, experiences within and as it).

But of course that, although perhaps not initially, easily becomes the very problem it is trying to avoid, if it is accepted unquestioningly.

POST: Astral projections meditation/ findings on my studies into the practice

Some brief thoughts:

the shortcuts have potential dire consequences as the forces you would be dealing with are often beyond your control.

Scare-mongering, surely? (Albeit perhaps self-scare-mongering.) What are these "forces"? If you aren't in precise control of every detail (as some sort of conscious deliberate architect of the minutia), why would that necessarily mean that the gaps filled in would be with "dire" content?

Also, your subconscious mind has to agree

What exactly is a "subconscious mind"? Where is it and what is it made from? Does it operate independently, make decisions and do things separately? I suggest it is a conceptual fiction only.

as well as rituals such as spirit cooking and concepts black vs white magick I have decided that these practices are not safe and without properly trained people in your presence can really put you in a bad spot.

More scare-mongering, surely?

This subreddit is not about "magick". Or at least, it's only about it in the sense that all such topics seek to capture something of the "nature of experiencing", aspects which our everyday assumptions and descriptions do not recognise, and draw attention to them. However, I feel that much of what you are saying is simply swapping one limited description (that the world of a "stable, simply-shared, spatially-extended place unfolding in time") with another one (the world is a "place seething with hidden forces and dangers independent of you, and you need to try and persuade your subconscious to help you out"). I'd extend this view to any romantic notions about "higher selves" and "spiritual growing" too, really.

Here, then, we're not only investigating "the nature of experiencing" (with "results" a target and excuse to do so), we're also pushing back on the nature of descriptions about experiencing. Doing so leads to a "meta" perspective that somewhat recontextualises many of the things you are talking about. In essence, it is not just the specific content of your experience which is driven by "patterning" of yourself (yourself as you-as-awareness, that which "takes on the shape of experiences", rather than you-as-person, a

particular "structuring" of experience), but the broader formatting also. All your entities and levels of mind and so on, then, are as much "results" as any event-based outcome; they are all just yet more experiences, at the same level as all other experiences, on an "as if" ("as if something were true") basis only.

The only fundamental, permanent truth is the fact of being-aware - or "awareness" - with everything else temporary patterning on an "as if" basis. Rather than a person with a subconscious who is sending out requests into the world, you are more like a "non-material material whose only inherent property is being-aware or 'awareness', and which 'takes on the shape of' states of experience, states imply and define all subsequent sensory moments". Right now, for example, you have "taken on the shape of" apparently (on an "as if" basis) being-a-person-in-a-world. Meanwhile, this means that any so-called "magick" is, despite any theatrics that go along with it, a self-shaping of oneself into a new experiential state. All apparent entities or techniques or other causes that are experienced are just aspects of that state: moments as "results".

As for the intention of the subreddit itself, this previous comment highlighting the difference between this and the LOA sub perhaps has some relevance.

Truth is that it seems much more plausible and even accurate that maybe actually we ALL (as everything else in that current moment of existence) are the state itself ?

Yes. I think you are assuming that when I say "awareness" that I'm meaning an awareness or the awareness, like it is an object or thing, or a personal awareness. That's not quite what I'm getting at. Nor am I saying that the world is "your" world, like a personal world.

Instead, it's more like "awareness" is a non-material material that is in a particular state, and that state fully defines the world. And that "world-pattern" also fully defines all the people in it. However, the people aren't beings, they are patterns. The only "being" is awareness, and that is the only thing that ever "happens" or has "experiences".

So, right now, the experience you are having isn't an experience of you-as-person. Rather, it is you-as-awareness which is experiencing being the entire eternal state or world-pattern, with one particular aspect of that unfolded, the you-as-this-person perspective. The "person" is a pattern, and when that pattern is unfolded, that corresponds to a "person experience".

But, as you say, "we are all the state" - in the sense that the state defines all of the people-patterns. However, what you truly are is always actually awareness, shaped into whatever experience you having at the moment.

So there are no "people" at all in the sense that it is usually meant: independent beings having independent experiences. However, there are of course "people" in the sense of their being experiential content that is apparently from the perspective of being-a-person. But a "person" is a patterned experience you might have, as awareness, and not something that you "are".

All the poetic phrasing tends to be required because we are usually starting from the idea that we are a person, and then trying to describe the actual situation relative to that. I think it's probably more efficient, and leads to a more coherent overall description, to step back from that from the outset, and assert the alternate perspective. Then we can avoid "higher selves" and "forces" and "entities", because we can view them in the correct context from the beginning, and see everything from the viewpoint of "awareness".

That is, there is being, but there are not beings or independent objects. When we think of the world, we shouldn't think of it as a spatially-extended place scattered with objects like a sort of sensory moment except out there somewhere - but rather as a sort of eternal non-spatial "pattern" dissolved into the background of awareness, from which we might unfold experiences, including person-perspective-formatted moments of experience, with only one experience happening at a "time".

POST: Could this be a sign? Seeing owls everywhere again

[POST]

I recently tried jumping twice for 2 separate this and I have started to see owls everywhere again. Which is a common occurrence with me and others it seems. Well anyways I saw this on Facebook and it really stood out to me, and it's just an ad so it's pretty random. Do you think this could be a sign that's saying to like choose my awareness/consciousness wisely? Part of me feels that I'm just reaching but it's too much of a coincidence and way to clear of a message to be I think.

[END OF POST]

AI: Owls are just owls, they are not signs from the universe or anything like that. The Owls of Eternity exercise is more a demonstration of patterning than anything else.

As the other commenter says, they are best not interpreted as being "signs" from anything. What could they be signs from, even? Rather, you might more usefully view it as an insight into the nature of your experience.

Ultimately, you should consider that your usual description of yourself as a person-object located within a world-place is perhaps not entirely accurate. And "the world" is not in fact, as usually assumed, a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'". For example, that you-as-awareness has "taken on the shape of" an owl pattern - as if you were a landscape with "owl" scribbled all across it, with it becoming clearly visible when an appropriate context arises.

POST: The name of this subreddit annoys me.

Dimensions are a way of measuring space.

You are assuming that the specific "physics and mathematics" use of the word "dimension" supersedes other, more common and pre-existing usages. Poetic usages, you might say, which are actually more fitting for the subreddit's broader concept. Using terms like "realities" and "universes" brings baggage, a tendency towards certain specific literal interpretations, which wouldn't be as appropriate.

This is something that works both ways, of course. For example, people assuming that a "law" in physics is something like a legal law that must be "obeyed" by the universe, or that a "theory" is just an "idea" - or worse, that a physical description is an explanation of "what is really happening". This unpacking of terms and the nature of descriptions is in fact part of what this subreddit is about. So the subreddit name is in a sense a meta provocation in that regard.

POST: My final post

Well, certainly nobody should be getting obsessed with me! So I'm glad you got over that! :-)

As the sidebar emphasises, "Never believe something without personal evidence; never dismiss something without personal evidence". The main underlying idea here is, ultimately, to explore our assumptions about the "nature of experiencing" and the nature of descriptions about experiencing, and to draw our own conclusions. In particular, to be skeptical of narratives. But I'd hope that nobody approaches this as a "believer" - rather, as an investigator and philosopher.

I definitely agree with the attitude of, if you're not getting anything out of something, then explore something else instead. Particularly when it comes to this topic.

I probably disagree with quite a bit of what you've said in your post, though. Not because it is particularly "wrong" as such, on its own terms but because it perhaps - it seems to me - takes some concepts at face value that I would not, although mostly because it perhaps drifts away from the "meta" philosophical perspective that a lot of this subreddit is written from. Experience is what it is, but descriptions... less so!

Quite a few things seem to be implied responses to things that I don't think anyone has said, or at least not that I've encountered as being said, in the way you seem to be interpreting them.

For example, to pick a few, randomly:

I think "enlightenment" is an actual thing, not just an "experience."

I don't think it's been suggested that "enlightenment" is an experience. Mostly the opposite point is made, I think.

That is, that people often report having had amazing and unusual experiences, referring to them as "enlightenment" experiences - encouraging others to engage in practices in order to aim for such "transcendental" moments. But those amazing experiences are just more experiences. "Enlightenment" is not an experience; it is the recognition of the nature of all experiences. Meditation may or may not end up accidentally giving you that insight; and amazing experiences or a experience of "being a void" may trigger that; but enlightenment itself isn't any one experience. That's why it's often said that there's nothing you can really "do" to get it (and that it's not a thing you can have).

"Enlightenment" is not something one can have by just doing a two glasses exercise. It doesn't work that way.

I'm not sure anyone ever suggested that it was. However, pushing back against your assumptions, via exercises and contemplation, might lead you to an insight as to the nature of yourself and your experience. And so in that sense, it might. At the very least, doing this shines a light on your unexamined thinking up until that point, particularly if you produce experiences which conflict with your usual world picture. Again, it wouldn't be any particular experience that would be an "enlightenment" experience; it would be noticing something, perhaps as a result of breaking down an assumption.

But still, if you want to be an enlightened being, you probably do have to meditate 10+ hours a day

That kind of depends on what "enlightenment" is, and what "meditation" supposedly does. Without unpicking either, it's hard to say. What is it that doing more meditation gives us? Now, I wouldn't say that meditation is worthless in a general sense. For a start, it's not just one thing of course; there isn't a one activity called "meditation". More, the idea being challenged is that: meditation => enlightenment.

I just don't think that this world is a subjective idealist universe that one can bend to his/her will.

I'd note that this is not necessarily the "recommended" conclusion. The framework of subjective idealism suffers from similar problems to the "person-object located within a world-place" framework, simply be being a framework. A lot of this is about pushing back against all frameworks, even the notion that there is a particular "how things are" (that can be conceptualised anyway).

If you had some technological device that dramatically improved the processing power of your brain, memory capacity, concentration capability, ability to visualize, etc that would probably dramatically improve your ability to manifest things...

Of course, one might then ask what the relationship between "brains" and experiential content actually is, and why the properties of brains would have any affect on the ability to change the world... and what is a "the world" and what is "powerful" and what is a "soul" and what is "you" and what is meant by "God". And so on.

Anyway:

I'd stress, I think, that what's important here isn't necessarily any particular result (even though I think most people get something, an inkling to start them off, despite the exercises basically being everyday actions).

The quest for results is really the entry point to challenging our assumptions, our descriptions - descriptions based on concepts like the ones you are using above. It's about being very picky and very clear about how such descriptions relate to direct experience (if indeed they do). And if that amounts to "dangerous ideas", then we'd have to say how, exactly they are dangerous. The "meta" perspective, you might say; the opposite of "belief".

But I still don't view this as enlightenment... Enlightenment is realizing what we truly are.

Basically, it amounts to the same thing, I'd say.

What is there, other than experiences? You might respond: that which has experiences! But when you look for that, you can't find it, and then perhaps starting thinking that "you" and "experiences" are identical...

We might say that this recognition is really a recognition that what we are is not a thing. It is "wondrous and mysterious", but we have to be careful that the poetic words don't get in the way of what we are after, since poetic words do tend to imply types of experiences, when what we are after is what is "beyond" any particular experience. The sense in which it is "mysterious" is that it cannot be conceptualised, therefore cannot be understood - it can only be known. And it's "wondrous" because it is not of any particular structure, while being all structures, etc.

But that there, that's getting caught up in a description about it, which is a distraction of the thing itself, of course! Anyway, I think you get the idea.

But I basically think that all of this is a simulation.

If the brain is the material manifestation of the mind, then what is "the brain" made from, and what is "the mind" made from? Where are they located relative to one another? And if they are of different types of material, how does one cause the other? Etc.

Now, we can dig away at the simulation-style approach for ages, picking apart its different aspects, but ultimately I suggest:

If you follow it all the way through, you'll eventually be forced into drawing the conclusion that: there is only one type of "stuff"; this that "stuff" is non-material and has no inherent structure; its only inherent property is being-aware or "awareness"; it "takes on the shape of" states of experience; it is self-shaping and self-causing; nothing ever "happens" other than this self-shifting; this "stuff" is what you actually are and you've just "taken on the shape of" the experience of apparently "being a person-object located within a world-place".

That is, you'll end up throwing away the whole notion of a simulation, because after you realise there can't be any boundaries of type, it all collapses into one idea, the idea of "patterned awareness". Which isn't of course an entirely accurate concept either, however it is the description which has the "least wrong" about it. And, in fact, that's mostly what we end up doing here I suppose: removing what is "wrong" until we're left with the most basic, self-consistent, version.

I am still not convinced that we can do absolutely anything and everything we want in this reality just by intending it.

And that would be fine, right? You're not meant to be convinced by reading stuff other people write. Although, it's still worth digging into why, exactly we might not be convinced - and then picking apart that explanation too, until we get right back to the fundamentals (of the self, perhaps?). I would say that the devil's in the details here. For example, if for simplicity's sake we say that "the world is made from mind", does that mean we should expect to simply flap our arms and fly? Why so or why not? (Noting that, mostly, people who say things like "why can't I just fly?" have never actually attempted it when you ask.)

In your post, you mention things like "rules". We could rephrase that as, our experiences are certainly structured. In other words, we are not coming to this as a void; we are already "patterned". Otherwise, of course, all we'd be experiencing are random disconnected sensory image fragments or the like.

The real question, then, is: is that structure fundamental?

And from that: can pre-existing patterning be modified?

I'd suggest that it is "interesting" to pursue the answers as "no" and "yes", respectively.

Now, since "intending" is essentially just a synonym for "self-shaping" (following on from the description of the self above), we might want to be careful with phrasing like "just by intending", because it might be obscuring quite a bit of detail, I feel. For example, if you "intend" for your arm to be in the air, you'll typically have the experience unfold of your arm moving from down here to up there. Why doesn't it just "appear" up there? How does the "just" play into this?

But then, does this apply to situational outcomes successfully, which are not so obviously "reality-breaking"? If someone has had outcomes arise in that area - repeatedly, of course, to confirm there is "something going on" or not - then what's the difference? Having explored that, can one apply what was done there, now in a "meta" way, such that we can feed the experiment back in on itself?

Those are the sorts of things I'd tend to ponder, anyway. (And "pondering" and "investigating" are definitely the right words to describe the appropriate approach, I feel.)

As I said TG, I will not be spamming your sub with my skepticism. So I will contain all of my doubts in this thread.

It's a good thread. Unpacking this stuff is partly the point. I should add that it's not "my" sub in the sense of being intended to promote a particular worldview of which I'm a proponent; it's more meant to be a place where things are picked apart, with my contributions just being one particular angle, perhaps somewhat variably. The exception to this being, the general "meta" approach of it.

I think there are still rules, that can perhaps be overridden...

If they can be overridden, then they aren't rules in any meaningful sense; they are malleable patterns...

Surely we are meant to be continuously learning?

Learning what, exactly? And about what? (Putting aside the idea of being "meant" to be anything or doing anything.)

We are continuously having different experiences, and that includes different thoughts and ideas about experiences. That's endless. But the "meta" point would be that none of those experiences ever actually get any "deeper" into experience itself. Just like (cheesy metaphor incoming) how it doesn't matter how complex the ripple pattern, it doesn't really tell you anything more about the nature of "water" or "ripples" in general.

So you might have "in-world" learning, as experiences, but that doesn't apply to the "meta" insight, which you have been calling "enlightenment". Not getting this, is perhaps why people become endless seekers, looking for the experience or the understanding, but...

Surely the human mind/brain cannot understand all the answers to existence.

Setting aside the assumptions implicit in "human mind/brain", this also assumes that existence is structured in a question-answer format. Actually, "questions" and "answers" are "made from" existence. Existence, if you like, "is" mystery in that sense. There's nothing at all to understand about existence, because it's not a thing, and has no inherent structure, it can't be "explained". Mostly what you end up doing (what we've ended up doing) is picking apart how various understandings fail to capture existence, rather than how they explain it.

But more and more, you seem to be saying the same thing over and over again.

Bah, such is the way of things, really. Well, the metaphors change and evolve and suchlike, but ultimately we're all just saying the same things repeatedly in slightly different ways. I'm not sure what you expect. The answer is - the idea is, really - to make up your own stuff.

I'd stress again, though, if my angle on things isn't helpful, then don't waste your time with it. It's not remotely "special". There are plenty other ways of describing and exploring available; and I'm not even pushing my own approaches as particularly great! Remember, too, it's not about it being "true". Experience is true, but descriptions are like parallel experiences: they used to point at other experiences and provide ways to talk about them. If they're not doing that for you, then pick another one. You should be synthesising your own ones, of course - after all, the idea is that this is your own exploration of yourself.

It should also be noted that other people's anecdotes really don't matter. They might give you ideas for things to try, or different ways to think, but beyond that they're largely irrelevant.

but I am not sure if the results were mere coincidences and I have not been able to replicate them.

Replication is definitely the key, as you say. Repeated "coincidence", across different situations, with a particular approach (not quite the right word) being the common factor. "Results" may not always be quite the same as "successful outcomes" in the manner of a pass/fail format, though.

As I've linked before, there is a slightly difference in concept between the LOA sub versus this one. That is, this subreddit isn't focus around getting results as such. Not about leveraging any supposed "mechanism" or law, anyway.

But, definitely, the two exercises are intentionally structured to "encourage" experiences which illustrate two main principles (which actually turn out to be the same principle really), from which one can extend outwards. Definitely in terms of philosophy, and hopefully experientially. In either case, "doubts" shouldn't matter (if we're interpreting that as a form of passive "belief"). If, that is, there is "something going on".

What does matter, I think, is that the these things aren't viewed as "techniques" or "methods". Better as, perhaps, "exploratory strategies" structured around patterns. In terms of how far that goes, it's deliberately left open-ended, as is what constitutes "success". It kind of has to be that way, because (as we were saying), this really amounts to an exploration of the structure of self. Otherwise the sidebar and intro stuff would be written in a quite different way, of course. (It's quite specifically written how it is, to distinguish it from a LOA or magick or psychonaut type thing.)

All of which can sound a bit vague, but I think that comes with the territory a little. How do you even talk about the idea of reformatting your perspective, for example? You can't really describe "how" to play with "becoming the background space", for instance... because there isn't really a "how". You just have to get a couple of hints of a similar experience (e.g. owls type experiments), and then dig into it.

In your words, what do you think would the best and most efficient way to maximize the possibility of getting the specific result you are intending? It seems that too much of this stuff is being left to chance. We're all just hoping to get lucky. What is your success rate? Does 50% of the things you intend, come about? 70%? 100%?

When you say that stuff is being left to chance, what do you mean by that?

When I intend, it seems that whether or not the result I'm intending for actually happens is left to chance, like a lottery. You play and you have chances to win, but the chances are very low. It seems like that a lot of times.

So, as I said above, I think you have to be wary of thinking of things in terms of them being a "method" or "technique", and there being some sort of "mechanism" that you are tapping into. Although the structure of language can be a bit confusing on this sometimes, "intending" isn't an act, remember, it is not something that "you" are doing to "the world" - it is itself the change in state.

In that sense, then, there is no ultimate "way". The "ways" are themselves aspects of your state.

So, very specifically, the two exercises in the sidebar (for example) aren't described as methods, bar the occasional slip of the tongue. For that reason. There are always "results" from intention, but that's not necessarily the same as immediately "getting the exact outcome I planned for", because you are pre-patterned, and intention is an adjustment, not a reset. This means that the outcomes of intention shouldn't be viewed through the perspective of "pass/fail", but rather as information - feedback on your current state. You are probing your own shape. There's "luck" involved only in the sense of "mystery": that you don't know your previous condition, specifically and explicitly, except by how it adjusts with intention.

This prior condition (the fact that you are not in a void state) means that "owls" and "two glasses" don't lead you to suddenly appear on Mars or whatever. However, the principles involved in the structure of those two exercises, tell you all you need to know about intention (which is the only true cause). And they also tell you that "mechanisms" are themselves patterns which can be intended. So that's where you start in your investigation to "get better": you might say can go go "meta" and experiment with "voiding" patterning and/or intending "formatting", and also not re-implying patterns by intending outcomes that are based on them for their structure.

You can see, though, why this "meta" aspect means that nobody else can really tell someone what or "how" to do, because that's the exact thing that's being unpacked: your own condition. This isn't about a specific technique that's promoted or even a specific description to believe in. And that's why this isn't LOA or a subreddit of that type.

But of course, this is just my way of talking about it. The subreddit frames itself as a starting point for investigation, not as the result of that!

And lastly, what is "meta"?

Heh, that a completely fair question, right enough! Generally, something is considered to be "meta" if it is about the subject, one step removed. For example, "metadata" is additional data about the data: metadata within a photograph is data which describes aspects of the image. A "meta" reddit post in a subreddit is a post about the subreddit itself. In this conversation, if we were talking about "content patterns" of experience, then a "meta" perspective might be one which applies to all content patterns, a pattern about all patterns.

In the context of our discussions, keeping a "meta perspective" would mean that as we discuss the world and ourselves and so on, we remain aware of the nature of our discussion: that is, we are exploring "ideas" and remain mindful of what ideas are, what "discussion" actually is, and don't conflate ideas and discussion with somehow getting "behind" our experiences.

["mechanisms" are patterns too] Is that, for example, how things like rituals come about?

If you think about the Two Glasses exercise, its "mechanism" is basically an invoking of existing patterns of experience, such as "level", "intensity", "transition", "transformation", "translation", "identification", "association". They are abstract generalised patterns, to which one attaches other content, and thereby (or so the theory would do) alters it.

But this is really just a version of everyday life stuff, I'd say. When you intend to have your arm wave in the air, then you are bringing the extended pattern associated with "arm in the air", the meaning of that idea, into experience. When pouring water from one glass to another, you are similarly bringing into experience the entire meaning of "moving stuff". So we're basically talking about meaning and metaphor, realised. The distinction between literal and metaphorical collapses!

"voiding" patterning and/or intending "formatting"

Well, it's just the idea that - according to our little Patterning Model here - all that there is, is awareness in a particular "shape" or overall pattern or "state", which itself consists of all possible patterns eternally, just at different levels or "intensities" of contribution.

Now, it's patterns all the way down, but some patterns would be "facts" (like: the red ball is on the lawn) and others would be "formatting" (like: the senses, spatial extension, moment sequences, etc), and so on. Although these categories are just for convenience when discussing this, of course; they aren't organised that way particularly.

The idea of "voiding" a pattern would be reducing its intensity of contribution to an effective zero. The idea of intending "formatting" would be to change the apparent structure or perspective of moments, rather than just the factual content. It's "meta" all over again!

For example, right now you probably feel as if you are sort of located in an area somewhere in your head, looking out. This moment of experience has a formatting of apparently being "over here" and the room being "over there". Note that this is different from the perspective of the experience; I'm talking about the sense of "being this part of the experience, not that part".

However, you could instead adopt a change in the formatting of this, such that you are the "background space within which the whole scene arises". If you do this, you feel that you are "everywhere", as a sort of observer-container, rather than being identified with just that one sensation in your head area. (The next step one could take would be to identify with "experiencing", that is you would be "that which the experience is made from": identifying with awareness. That is a change from "observing" to "being".)

As always, of course, these descriptions are just alternative thinking-structures, in parallel to the main strand of experience. Experience remains what it is: experience, not "patterns" or "formatting" or whatever. The fact of experience is true; the descriptions themselves are only true as that: descriptions (or: the experience of thinking descriptions). However, by seeking the most fundamental description that can capture the basic structure of a "1st-person" experience, we're freed up creatively in terms of what can be conceived of and discussed, and what can be experimented with.

...

Life can easily pass one by while waiting for miracles to happen.

Definitely, I think one should never do this. Particularly if one is prone to:

I am thinking that serious meditation is one way one can improve's one life. So it's a win-win situation, assuming one meditates correctly, and seriously.

That sort of thinking, if not done cautiously.

Which is, thinking that if you are just "logical" or do something "correctly" or "seriously", it'll work out. That can be a version of "hoping", just with with some broader more plausible sounding words swapped in. It can be a bit like, "this next thing sounds good, particularly while I don't know much about it yet and can project my hopes upon it - all I need to do, is do it 'right'". That's how people spend their whole lives being "seekers". Putting their hope into the unknown, checking it out superficially and perhaps being disappointed that it's ultimately a bit boring and a slog after the initial excitement - too much like homework, surely not what they real things would be like! - and moving on. So that's the second thing to never do, I suppose: waste life by always just looking to the horizon.

serious meditation is one way one can improve's one life.

Perhaps it might (there are certainly nice effects, depending on what exact meditation and so on, and the possibility of insight), but it's important to be more specific in the doing, otherwise it'll just be making the same error again. If the aim is to "improve life", it might, but actually if done "properly" it might also result in some grim experiences as things unfold, just as even the "daily releasing exercise" does (where you are lying on the floor in the constructive rest position, letting go). That is, that looking for the "magic action" that'll make everything great, rather than treating things as an experiment, usually leads to superficial experiences and possible endless seeking. If the outcome is judged simply on whether it feels good that time, or a "pass/fail" outcome, then one never really changes. Particularly because, the ideal outcome being sought is, I'd say, not a particular experience or feeling or whatever (although those can be good), but a change of perspective. That improves life most, I reckon. So it comes back to that thing of approaching things as an "investigation", without really having a fixed expectation as to the outcomes, or even the type of outcome. You might then find out useful things for improving life, but that's unproven until you've really dug in - so in the meantime, it's important to improve life using the tools you've already got, rather than waiting for some new amazing-super-tools which you may or may not get a grasp on.

Six months meditating (in a specific way, etc) does sound like an interesting experiment to try.

...

Q: One can also meditate for decades with no results at all, or, can even go psychotic during the process, so I agree with you that this mode of thinking can also be dangerous if not approached carefully. This is why I'd only be willing to try it for six months to a few years. But, really, what do you think of the Jhanas and the Siddhis u/triumphantgeorge. I have done loads of research on this, spoken to many people with actual attainments. They've showered me with love, and some have even read my mind (although somehow, they manage to leave room for "plausible deniability.") But it was very impressive nonetheless! And they no longer need to sleep or eat, because they have advanced through the various jhanas, which provide joy and bliss that is thousands of times more pleasurable than one can experience through orgasms or drugs like heroin-----all through meditation. Of course, one can meditate for decades without experiencing the first Jhana. This is why I am approaching this in a logical, result based manner. One guy I've communicated with also strongly hinted to me that he has recollected his past life memories, and possess all kinds of abilities that one would consider as supernatural. He just never go into detail about them because he asserts the most important thing is enlightenment and transcending the human realm of existence. So to me, right now, it seems that the serious meditators have more "clout." I don't think anyone has attained these abilities through dimensionaljumping or lawofattraction. Most people don't know if they can experience a bliss 1000x more pleasurable than heroin/sex just by sitting somewhere. And more and more, it seems to me that existence is hierarchical. I started to believe that there were no such thing as higher beings, and higher realities, but I'm starting to think this is just untrue. The angels, demons, gods, extraterrestials, etc all exist. The universe teems with life. These beings aren't illusory. Just as humans will probably this century, create conscious artificial computers that are vastly smarter than humans, it makes sense that perhaps in our own universe or a higher reality, there are beings that are vastly smarter than us. And some of the accomplished meditators have had genuine communication with these entities. There was even a redditor here on reddit, u/absolutus, who seemed to have attained some of the Jhanas. He would probably be very confused to know that all of the hard work he spent meditating and working hard was entirely unnecessary. All he had to do to have

the life he has right now was merely intend it, if what this subreddit is about, is true. So, I'm really curious on your thoughts on all this. Have you experienced the Jhanas? Do you think they aren't worthwhile? If you cannot read my mind in this very moment, why not? And why can another guy read my mind and not you? One person has told me things about myself, that I didn't know. Do you still sleep at nightt? Why do you do so, when another guy doesn't need to sleep? Why eat? I know you don't like talking about your personal life, but you will find a lot of people on youtube describing how they no longer need to eat or drink water. And they have their face and voice on camera. I am not trying to put you down u/triumphantgeorge. I am just curious.

So, this sounds like you're somewhat falling into the "gurus and teachings" narrative template (or "pattern"). And the way you use the term "intention" - or "just" intention and its use in contrast to "hard work"- suggests that we're not referring to the same ideas here (intention is not an "act" and it is not in-world). I feel that this applies also to many of the concepts in your original post, and to the way you are using the term "universe" - and "existence" and "entities" and "meditation" - in this post. That is, you are talking from a position that is already "too late" in the discussion, so we are talking at cross purposes. Meanwhile, you might consider that there is a reason why, in your research, you'll have heard the siddhis referred to as a "distraction". This reason is to do with the context within which all of these concepts and experiences reside - that is, the "meta" perspective for all of this stuff. Ultimately, it's the same reason that the subreddit isn't about a "teaching", but an unpacking of "teachings" and descriptions - and it's not about any particular experience, but an unpacking of experiences and the conceptualising of them. Similarly, the sidebar deliberately refers to "exercises" rather than "techniques" or "methods", and in discussions we talk of experiences being "as if" something is true rather than at face value, and so on. All because it's trying to shoot straight for the insight - rather than there being a "path" with a "teacher" and developing "powers" or whatever, all of which can turn out to be slightly nonsensical later (other than being an experience). So, rather than tug at one piece and then another here and never really get to the foundation of this, I think later I'm going to write a response from a "ground up" perspective, and then you can pick at that.

I would still like to know why you can't read my mind, but some of the "gurus" can.

It's potentially a quite meaningless question. A more appropriate formulation of the question would be: why are you having an experience of this person "reading your mind", and not that person "reading your mind", and so on? From which we have:

It's completely up to you...

Oh well, perhaps not then! :-p

If I may just say - you seem sort of weirdly "offended" somehow. Like you were promised something in particular, and you weren't given it by this subreddit? Or that me, as a moderator here, has taken on the role of a guru or teacher, and not delivered to you what you aspire to? That's not really the setup though, and this subreddit isn't founded on a promise of quite what you seem to be assuming - for a reason. Which is, that none of that stuff matters much, when it comes to the underlying thrust of this, about examining the nature of "experiencing" (and of descriptions about experiencing). In fact, it's more likely to make you fall into a little dream instead. Anyway: Now, when I say "guru and teachings" pattern, I might equally have said it was a "journey of discovery" pattern, or similar. It amounts to the same thing. By saying this, I'm not disparaging such experiences at all; there is nothing remotely wrong with having these experiences. I'm just trying to articulate a wider point, which encompasses all of this. Which is that they are "just" experiences. It's like looking at the forms made by ripples in a puddle. And then imagining that there is some "world" behind those forms, going off on a big adventure where you discover the meaning of those forms and that world, encountering fascinating characters along the way, learning new powers, battling with entities, maybe being able to summon objects and circumstances, reaching great heights of achievement - and then:

You notice that all of that was still just differently shaped ripples. And: You are the water and the ripples. And even the experience of apparently being a person-object in a world-place at all, is just a particular ripple within you - and actual-you are not an object or indeed anything particular, other than having the property being-aware (that is, having the experience of however you are "rippled"). Basically, the thing I feel that you are missing, is that it doesn't really matter what experiences you have, including all these experiences of "flowing love" or meeting "people with amazing powers" and so on. That's just more ripples, just yet more experiential content. It's all that the same level, with no one experience actually being more special or getting behind things than any other experience. What actually matters, I'm suggesting, is to notice the context of the experiences. That is, to notice "that which 'takes on the shape of' all these experiences", the nature of all experiences rather than the content of any particular one. The "material" of experience, if you like - that actual, non-personal "you" which becomes those moments of apparently being a person in a situation ("as if" it were true; consistent with the idea of it, but not actually the true nature of it). This is what things like that Feeling Out Exercise are trying to offer a way into, and what the experiences triggered by the two demo exercises are intended to point to, - drawing attention to a couple of the key counter-intuitive aspects of actual experience (it ain't about "powers" as such), leading to an appreciation of this context. Keeping it simple and stripped down, too, by carefully noting that any descriptions are themselves just further experiences. Thereby hopefully avoiding falling into a self-perpetuating dream based on one (related: if you haven't already, check out the Kirby Surprise interview linked in the introduction post, as a nice illustration).

I hope that helped clarify somewhat where I'm coming from here. Elsewhere, you seem to muddle up the idea of "intention" with being a sort of in-world personal "action", and have a notion that an intended outcome would mean there would be no subsequent experience of bodily action - no "hard work" or "effort" - but I think if you think of that from the perspective above, it should be clear how this arises from a misunderstanding of what is meant by those terms.

Are you really a puppet master of the physical dream world?

I think that was probably a joke reference, actually! :-) Especially if it was in amongst some Nefandi-related banter. I'm actually fairly careful to avoid doing anything other than facilitate discussion or unpack descriptions and ideas, because (as the sidebar says here) it's not meant to be about any particular person and their experiences - ideally, "no teachers or teachings". (And there's this basic issue with that anyway, as I've pointed out, and which we'll cover again below.)

But reality doesn't work that way.

Your response there is full of assumptions, though. In fact, the exact assumptions that are being pushed back against and explored. In particular, the idea there are individual people which have minds, that all exist as objects within a shared place, and have intent as some sort of "power" which varies in strength, with a struggle to win. In short, it's based on the description structured around you being a person-object located within a world-place, with "the world" being a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'". I suggest to you that this description is not accurate. Or at least, it is not fundamental. In particular, experience is not personal (even though it can be "formatted" in a way "as if" it was from a personal perspective). Basically, you've answered with "reality doesn't work that way" to a suggestion that you are currently making incorrect assumptions about what "reality" is (you're using those assumptions to structure your response). I'd also add: "intention" as some sort of personal willpower is not the sense in which that term is being used. It's not an act, or a wish, or a want, or a willing, because those would be things done as a person, an object. How could that even work? How could such a thing influence the world? Rather, it's supposed to indicate something more like a self-shifting of state, a "becoming".

As you say, experiences are meaningless.

They are not meaningless as experiences. Results are not meaningless as experiences. They are only meaningless in terms of some sort of aspirational descriptive framework where you "win the game" in a fundamental sense. However, experiencing is in and of itself meaningful, as a fact, independent of specific content. This same thing arises when the question is asked, "if it's all just awareness, then what's the point"? But that dry wording belies the fact that the only aliveness that there is, is awareness. All experiences being "made from" awareness, whatever you thought was the meaning of an experience in terms of a description about an experience, it was actually awareness itself that was meaningful. You might even consider that our desire for apparent goals, including your inclination towards amazing powers and control, is actual a desire to resolve our patterning such that we have a clearer experience of simple awareness! So the very thing you are suggesting would make life meaningless, is actually the thing you are implicitly seeking now, that which is giving meaning to your actions!

You might ask yourself: so, what happens when you have an experience of being "all powerful"? Then what? Just more experiences. You don't "achieve" anything, ultimately. But that is fine.

EDIT: I suppose what you might take from this, is that no matter what adventures you have, you've already won. Right now.

Q: I've got a problem with the idea of not valuing some experiences above others. I have memories - I mean my best memories - places' I've been, emotionally intense times with friends - beautiful walks - those memories stand out to me as diamonds in my life, like, the times that showed me what life is all about, what it means.. I feel like there's ..some kind of meaning behind life that's..a glimpse of the higher dimension we come from maybe? I feel like ...there's levels - Bottom level - unhappy times, fights with family, failures, times I felt bad, or bored and meaningless. I feel cut off from meaning, separate from this indefinable substance.

Medium level - just taking pleasure or contentment in the day to day routine of life - walking to work on a sunny morning hearing the birds sing, joking with colleagues as I work, singing along to a song on the radio, just peace in feeling the sensation of doing something I'm competent in, getting lost in my body movements and focus (not necessarily intentionally - I did this before I'd heard "mindfulness" was a thing)

Top Special Level - the most intensely enjoyable or peaceful times - walks with people I love in a beautiful place, meetups with friends I love the company of, days when everything went right for me - I bought a book I was excited about, the sun shone as I read it in the park, intense romantic dates, amazing vacations to places with powerful energy (can't explain in scientific terms but felt it). I feel that some of these top experiences just shine out as..times I felt most connected to the meaning of life, times I knew what life was all about or who God was - that these people and places, these interactions, here now, are what life is supposed to be (even though the same people and places could feel commonplace in other contexts). Like they were times and places where the veil between me and God/meaning were pulled down. Having said that, I have a few problems (mild Autism, anxiety, and having grown up in a close-knit church community) that mean I've had more problems making connections than the average person, so maybe a person with average social skills would be more used to friendships and relationships - maybe some of this intensity was just me, as an animal, with instincts for human contact, hyper-focusing on the contact I did have because I had less of it than the average person. Maybe a person with the regular/average amount of friendships and romance wouldn't value some of the times I've had like I do.

Really enjoyed your comment. Some thoughts:

I've got a problem with the idea of not valuing some experiences above others.

That's not necessarily what I'm getting at, in this conversation. It's not about not valuing some experiences more than others. Some experiences are certainly more enjoyable, and experiences have different in-world meanings in the context of personal history and worldview. But that "pleasure" or "meaning" is part of the experience. (When I say "experience" I don't just mean the sounds and visuals of the moment.)

Rather, it's about recognising that all experiences are of the same type or nature: that is, they are all "shapes" taken on by awareness. Or metaphorically, you might say that they are all like ripple formations in a puddle of water. Now, some ripple formations may be more pleasing to the eye due to their association with other ripple formations, but from the perspective of the water/puddle, no ripple formation is "special". Now, since when we are talking about "enlightenment" or at least recognising the "nature of experiences", we are really talking about that recognition that "all ripples formations are 'puddle' no matter what their shape", we can say that no experience is "special" in that context - hence, the idea of an "enlightenment experience" is flawed. The insight is not to be found in any particular experience, since the insight isn't about content, it's about context. I'd add that the urge we all have to create descriptions involving hierarchies can sometimes make grasping this sort of idea quite difficult. Really, it has to be a sort of direct intuition as a result, rather than conceptual. (The problem with all conceptual thinking is it requires a division of things into objects, and relating them in "mental space" - even if not strictly a 3D space because there is "feeling-sensing" thinking - but here we are talk about something that is "before" division and relation.)

Your description of "Top Special Experiences", then, is interesting, because it moves towards that sort of "direct knowing" experience. I'd suggest, perhaps, that one way to understand why those experiences stand out isn't exact due to their content as such, but that in a way they are less cluttered, less rippled, and for a moment you are closer to experiencing (really: being) just the open water, or the implicit state of the water, unopposed. This means that those experiences can be the most instructive (since they tip you off that your usual assumptions about the nature of "the world" and "you" may not be accurate), but I'd still suggest that they are not special in type. And it's not necessarily true that the experience => insight, so those who chase those experiences thinking they can lead to something, are potentially getting distracted, thinking of it the wrong way around.

...maybe some of this intensity was just me, as an animal, with instincts for human contact, hyper-focusing on the contact...

Maybe your tendency to hyper-focus, in this area and in others, actually works to your benefit - since unlike other people whose ongoing experience is a big splash-around of ripples and responses, you are narrowed down on a specific set of ripples at any one moment. And so when what you are focused upon just "clicks", becomes direct with no interference, then you're just there.

Now, that may not be "special" in the sense I've been talking about above - but it's certainly pretty damn good! :-)

POST: Do not doubt yourself

[POST]

I have been lurking here for fun for quite sometime. Whenever someone expresses their doubt, I am excited that at least some people here have some semblance of rationality left in their mind. However it does not last. Often the same people who express doubt quickly go back to trusting the words of the cult leader, Mr. George. Do not doubt yourself. If you started doubting, keep doubting. I don't know what motivates this man. Maybe he's running some sort of strange psychological experiment on you all. Frankly, anyone who takes these ideas here seriously needs to go see a psychiatrist. I have seen far too much madness here. From people claiming to "jump" to pokemon universes to people claiming to have changed their gender. People desperate to change their lives are often "easy targets" for religious conversion. This sub is no different from a religion such as scientology. Only difference is that you get your mind brainwashed here for free. You don't have to pay for it. Please, get on with your life. Spend less time on the Internet. Breathe some fresh air, get some exercise, and spend more time interacting in the real world. Your mind will thank you for it.

[END OF POST]

Well, I'd like to point out that the sidebar does specifically say: *An open mind combined with healthy caution is the correct mindset for all approaches targeted at the subjective experience. Never believe something without personal evidence; never dismiss something without personal evidence.*

If you've read any of the more detailed discussions, you should realise it's about the exact opposite of something you're are meant to just "believe" in. The general idea, in fact, is about investigating the nature of experience, and also the nature of descriptions about experience - ultimately without taking any description as being "what is happening" (that is, avoiding the "the reification of abstraction"). Of course, beyond that "meta" perspective, there's lots to discuss, and many different views to explore. And so: You'll also notice that the sidebar mentions the concept of "active metaphors", which should suggest something about the overall idea. (Hint: the "dimensions" of the subreddit name aren't "places", although one should note that "the world" isn't necessarily a place either, etc.)

Now, a lot of this should actually be relatively trivial as a perspective, for anyone who has considered the relationship between experiences and descriptions, be they everyday assumptions or scientific models (with the latter the idea that a description was "true" was traditionally seen as nonsense). But, here, we have fun knowingly exploring the implications of it - and perhaps finding out some interesting things along the way, maybe something more than that. Anyway - given that it's summertime, I definitely concur with your suggestion to live life, breath fresh air, maybe some exercise, and thoroughly explore interaction with "the real world" - whatever that is, exactly. And as moderator, I am grateful for you taking the time to create a user account on a Friday evening specifically to post this PSA; it should be a good seed for weekend conversation.

TL;DR: Do doubt yourself, **but doubt everything else too**, or at least don't not-doubt it.

If we're going to conversate, you will have to address the actual content of my arguments.

Hmm, I didn't notice any arguments.

Where is the evidence for believing that you can change your sex or go into a cartoon universe by looking into a mirror?

That's a bit of a misrepresentation of the setup of the subreddit, I'd suggest. It's an inversion of it, in fact. I think you are arguing against your own concept of this, based perhaps on the subreddit name, rather than the actual idea. As noted above, there is no encouragement to "believe" anything. Generally, the idea is that there are a couple of activities one might try out, and then contemplate the experience of doing so, from various different perspectives. Beyond that, there's no particular viewpoint advocated by the subreddit - except the "meta" perspective again noted above, of course.

This works both ways, though: although no particular "esoteric" view is specified, neither is the "standard description" pushed as some sort of corrective response. (Note that you have to make a distinction here between the content of the comments that myself or anyone else might make, the ideas that appeal to them and are being explored, and the "official view" of the subreddit.)

In fact:

If you do have an argument, it seems to be that, contrary to your rallying call to "do not doubt yourself", you are condescendingly suggesting that people exactly should doubt themselves! That is, they should doubt their ability to use their own critical thinking to assess experiences and information. Also implicit within this, is that it is somehow dangerous to explore interesting ideas, as if one might be somehow captured by them. That seems to ignore the possibility that one can play with conceptual frameworks - try them on and even have fun with them, see how they play out - without having to "believe" in them. This subreddit is meant to be the start of personal creativity, not the end of it.

EDIT:

I notice you added an extra bit about an "insult to your intelligence" after I'd already replied, so I'll append this:

I know it's a metaphor. But the metaphors stop there.

They don't, though. The metaphors don't stop there. Whatever a "metaphor" is, exactly. Which is one of the points, as regards the nature of descriptions and their relationship to ongoing experience.

Why not tell them it's all just psychological tricks that have no bearing on reality?

Because it's not a psychological trick. And it exactly does have a bearing on "reality". Again, what ever that is, exactly. And so on.

I'm not quite sure what you are angry about here - other than perhaps the idea that some people might not agree with you, or aren't to be trusted with reflecting on their assumptions, or something like that. Regardless, it does seem a bit patronising, and not based on a close reading of the subreddit.

You are consciously evading my questions. Why do you allow people to place their hope on changing their lives with these "exercises" that have no effect on reality? This is no different from the secret. "The secret" does not work. This also does not work. The only difference is the woman who wrote the secret got rich off of it, while you are selling people hope for free. If you know very well that no one will change their sex through these exercises or actualize whatever else they want, why encourage them to do it? You know it will have no effect on reality, except maybe having them think something weird is going on by experiencing mild "synchronicities" through confirmation bias.

You are consciously asking questions which are disconnected from the topic at hand, it seems. For example, in discussions there is a clear framing in terms of "exercises", "experiments", "investigations" rather than "methods" or "techniques". It is regularly pointed out that an apparent link between an act and a subsequent experience is problematic, and cannot be assumed. ("Confirmation bias" has a specific meaning which doesn't quite apply to this sort of thing, but I know what you are getting at.) And so on.

In fact, the conversations are very much focused on the deconstruction of experiences and descriptions of experiences - in both directions - rather than believing that this or that, or what could or should or did happen. I say the content of the subreddit is mainly in the discussions, actually, and intentionally. In the case of your comment there, there are lots of hidden assumptions to pick apart - your use of the word "reality", for instance. What is that? And without having conducted the experiment, you have no idea whether such a silly little exercise might lead to an interesting experience, or not. (And "or not" is a result too: if nothing at all happens, there's something to conclude from that. Even if something seems to happen, then you have to check you aren't misreading it, or in what context you are interpreting it, etc.)

Otherwise all you have is a default description of the world, perhaps not one you've really thought about very deeply, and if you have so much faith in it - well, that is a belief in an unexamined conceptual framework, a bunch of thoughts, surely exactly what you are opposed to!

I don't see how the ideas and exercises here are different from the exercises that are in the book "The Secret." Mind you, I read that book and couldn't stop laughing for days. Just as I don't need to try the exercises in the secret to know that it's fictional, there is no need for me to try the exercises here. Again, you are still being very evasive. You don't sound too different from a "the secret" or "law of attraction" teacher. When faced with tough questions, they find endless ways to explain why it does not work.

*AI: Just as I don't need to try the exercises in the secret to know that it's fictional
This might be the funniest thing I've read the past month. Thanks.*

A self-styled asker of the "tough questions", eh?

So, apart from the idea that one can conclude something from not doing an experiment, especially one which requires zero effort - although it is of course perfectly fine to consider something ridiculous-seeming and therefore have no conclusion beyond that - you are also discounting that just the fact of participating and discussing the subsequent experiences is in and of itself valuable and leads somewhere. However, it's not just that you are assuming that you know the nature of the experiment and therefore don't have to do it in order to comment; you are also implicitly assuming that you know... everything.

This potentially makes you a "believer" of the worst sort: a believer in an unexamined and vague concept (of "reality"), with a belief that it doesn't even need to be examined. You "do not doubt yourself", I suppose. Which, in turn, is probably also responsible for you holding a view of the nature of the subreddit without having really followed it. Perhaps, again, you feel you "don't need to" in order to draw conclusions. To hold beliefs about it. Perhaps that makes you a "free thinker"?

Again, I'll emphasis: this isn't about a method or belief, and in fact those two concepts would be held suspect also. You are perhaps confusing this with a "law of attraction" subreddit. Or confusing your own concept with the-thing-itself.

Anyway, there you go.

I tried magic when I was a kid. It never worked. I matured and grew out of it. Why would I go back to having imaginary friends as an adult? If it never worked when I was a kid who did not have any "strong beliefs," why would it work now with my mindset?

Magic, imaginary friends, strong beliefs, mindsets - not really related to this, I'd say, although some might sometimes draw connections (which should then be picked apart of course).

You seem to think someone's trying to persuade you of something in particular, but they're not. In fact, what "it" is, is what is under investigation. You can join in with that, or not - either is fine!

I do like your writing style. It's very "refined." But thanks but no thanks. I came here to set people free. Can't allow myself to be swallowed up by madness. I have compassion for you. Increasingly, it seems that you are the one that needs help more than any other person here.

Oh well. Thanks for your well-meant comments all the same. Cheers for now.

POST: Has anyone used dimensional jumping against somone else?

[POST]

Like used it to manifest somone dying or something like that?

[END OF POST]

Intention is quite powerful so it could be possible to negatively affect someone's life, however there's a karmic debt created that has to be accounted for.

Really? What makes you say that? Who or what does the accounting, how is payment enforced, and why would it operate in terms of our human conception of goodness or badness? Is there some external intelligence at work in this? So:

The notion of "karma" as some sort of ongoing tally of "goodness" shouldn't be taken for granted, I think. For instance, it might make more sense to conceive of it more like "the persistence of intentional patterns". So, if you intend an outcome of "bad things" for someone, then you may experience the general pattern of "bad things" in your ongoing experience thereafter (similar to how the "owl" pattern arises in a general way in the Owls of Eternity exercise). However, the solution to that would be to be more specific in your intention, to deliberately structure it with this in mind, thereby avoiding a generalised "bad stuff" patterning.

I think we have to be careful not to end up simply repeating things in a superstitious way - e.g. karma payback, magick is evil, all that - without digging deeper into the actual structure of those ideas. Personally, I'd say that there is nothing necessarily stopping you from harming "other people", no necessary reason why you suffer as a result of doing so. However, it's obviously not a very "nice" thing to do!

There's also the additional aspect that "other people" might be best interpreted as being aspects of you-as-awareness - your own extended pattern! - so you are really mangling your own state by doing things like this. If such power is available to you, then surely there are better ways to tackle whatever issue one is seeking to address.

Q: *Really? What makes you say that?*

My ability to track the path that energy takes was helped along by a near death experience I had last year.

Energy transfers mediums as easily as wind getting converted to sound when a breeze hits some wind chimes. There are no gaps or wasted space between the wind/sound even though they are two distinct separate paths of energetic travel.

Who or what does the accounting, how is payment enforced, and why would it operate in terms of our human conception of goodness or badness?

Human energy in the form of life and emotion transfers just as easily as wind on the chimes, without any gaps or wasted space between the energetic forms. For example, if I angrily honk at someone sitting at a green light absent-mindedly and it frightens them, my anger was transferred from me, to heat when my muscles hit the horn, to an electrical connection which created sound waves, which transferred to the person hearing them, resulting in another emotion of momentary fear. If you freeze frame that scenario, my emotional energy of anger still exists in the form of their fear, minus the heat lost in the transfer of that energy.

When I refer to "karmic debt," I'm specifically talking about the human energetic value that is present when a person initiates harm and causes some sort of distress, discomfort, pain, suffering, or the like to someone else. Just as water seeks its own level, energy will balance its self depending on the positive or negative charges surrounding the energy. That's not to suggest that the do-er of bad things will have bad things happen to them; I'm simply saying that somewhere down the line, that harm will be neutralized.

be more specific in your intention, to deliberately structure it with this in mind, thereby avoiding a generalised "bad stuff" patterning of your experience.

I think I understand where you're going with this, but the karmic debt I was talking about wasn't based on any superstition. It simply aligns with the laws of energy. There's no belief required.

Personally, I'd say that there is nothing necessarily stopping you from harming "other people", no necessary reason why you suffer as a result of doing so.

I completely agree. That's a thin line though. One could indeed manifest harm to other people without harming themselves, but that does not mean the karmic debt doesn't exist, it simply transfers to something else down the line. Nor does it mean that the creator of that harm won't have to experience an energetically-equal amount of emotional accountability when they face death. Does that make sense? Edit: When I say an "energetically-equal amount of emotional accountability" I mean that someone who manifested harm for society would be required to feel emotions in equal measure to the emotions they created in other people. The fear surrounding their own death, or the accumulation of guilt, etc.

Okay, so if I'm understanding correctly, what you are going for here is less like the general "negative energy" spiritual accounting concept, and more along the lines of a physics style "conservation of energy" principle.

However, aren't you muddling two different things here? That is, the abstract concept of "emotional energy" and the concepts of "kinetic and potential energy" as used in physics (as well as, perhaps, difference ideas of "charge")?

Regardless, we're left with the issue of tying such a model back to our actual ongoing direct experience. In physics, for example, "energy" isn't a real thing as such: it isn't observed and it doesn't do anything, it's pretty much an accounting principle which carries across different types of observations, as a handy connecting concept. It is used because it helps the sums work out - and the sums can be tested against actual (if somewhat constrained) observations, and the models tweaked accordingly. In this case, though, how can we tie this description to our direct experience? What specific observations can be made, to ensure that this description is worthwhile, and that we should be using it to judge whether there is actually a "karmic" issue to worry about? What would convince someone to follow it? While we might say that there is "no belief required" within the description, there is still some level of belief involved in the very assertion that this description is accurate!

To some extent, of course, this last part isn't really a problem: no description should really be taken too seriously, as "what is really happening". However, if we are going to assert a description is useful at all, it's appropriate to push back on it and ask in what way exactly they should be deemed as worthwhile or useful. (For example, the "meta" model of "experiential patterning" is useful because it can be directly experimented with and offers a simple conceptual connection to direct experience, even though of course it is not "true" as such.)

In terms of OP's post, it still remains open I think: in what way does the concept of "karma" actually matter to someone who wants to intend (what they interpret to be) a harmful outcome?

(It's just good to really dig into this, rather than to perhaps skip over our assumptions.)

Aside - I suppose it's worth us reminding ourselves that physical models aren't "what is really happening" either, of course; they are useful metaphors only. For example: the world isn't made from atoms, only "the world" (an idea) is made from "atoms" (a conceptual framework). So what in fact matters most about a "karmic" model is whether it is useful, rather than true, because it is inherently not possible for it to be true. At the moment, though, I'm not sure we've got much further than the idea that "intending bad outcomes might produce unpleasant penalties", which I think we have cast doubt on now, or "taking action always implies resultant change", which is a tautology.

Tautology is an excellent explanation.

Actually, to some extent this is the key point that we keep coming back to. That is, the nature of descriptions themselves.

All descriptions are to a certain extent "castles in the sky": the manner in which they are "true" is mostly in the sense of "conceptual truth", which is really just another way of saying their are internally consistent. This, as distinct from what we might call "direct truth", the actual experience that is present, now (although this is not just limited to the "sensory moment" that is now). The link between the two, we might term "observational touchpoints" - the ropes that link the content one experience (the experience of "thinking about concepts") to another (the experience of "this main strand of sensory unfolding"). So, my issue with the theory of karma outlined above - aside from my reservations of mixing different concepts of "energy", although I do get what you are going for there, which is that all experience must have a counterpart in the physical model if they are to share a conceptual space - would be that it is tautological in the sense of being primarily "conceptually true" (self-consistent) without sufficient "observational touchpoints" in order to make it useful as a pointer towards "direct truth". Basically, that it might ultimately be more of a narrative than it is a model, I suppose.

I don't see how they're two different concepts. Emotional energy is every bit the same energy identified in physics.

I think that "emotional energy" is generally used as a metaphor to describe a particular subjective sensation associated with an emotional state. Whereas in physics "energy" is an accounting principle associated with (loosely speaking) the position of particles in a particular context. These are two different conceptual frameworks, really. "Emotional energy" doesn't translate to a "physical world" energy unless we explicitly redefine it. Which we might be able to do, of course - but we can't just hand-wave it.

Where would emotional energy come from if not from physical energy?

That rather presupposes that the two conceptual frameworks are compatible, and/or that one of them (physical energy) is somehow "real" and foundational. The proper answer is probably that "emotional energy" doesn't come from anywhere in terms of "physical energy". And to some extent, from anywhere at all! Again, unless we redefine "emotional energy", to have a version of it in a physical model. This sounds picky, but:

The term "energy" is vague...

Not if we choose to be specific in how we are using the term, and in the mechanics of how it is being applied in our descriptions!

This presupposes that one must worry about their karmic issues at all.

Perhaps, but:

Even if we didn't worry about them; even if we just stomped along blindly without regard to the benefits or harm we're creating, the energy and its correlating effects can still be mapped out from start to finish.

This rather presupposes that there is such a thing as karmic energy at all! The effects are "only mapped out from start to finish" if there truly is such a thing, and right now its existence is what we are debating. If it doesn't exist, then there is no "mapped out".

In the end, all of it must be accounted for, energetically speaking.

Must it? Even if we translate "emotional energy" into a physical model, and say that energy must be accounted for (which is really just a way of saying that energy is never created or destroyed, standard stuff), there's still no reason to suppose that concepts of "harm" or "benefit" are connected to this. Now, one might say something along the lines of: "if you take an action, then that corresponds to a change in the form of energy, be that kinetic or potential, as heat or gravitational, or whatever". But that doesn't really mean anything for us, in terms of "harmful" or "beneficial" actions or outcomes. That sort of thing - moral judgement or interpretation - lies outside of such a framework.

If we ARE aware of the energetic balance in our lives, it still shakes out to even money. Either the individual had a net benefit or a net cost to humanity.

So far, though, this idea of "energetic balance" has no link to "goodness" or "badness", or other human conceptions of different types of events or situations.

I totally agree with pushing back on these concepts to determine their usefulness, but we can only tally the energetic profit/loss after everything is accounted for.

I'm still not (based just on this description we're digging into) convinced there even is such an energetic profit/loss, in the sense of one that matters in terms of good or bad behaviour, and good or bad experiential outcomes. There still seems to be a muddling between the concept of "energy" as used to describe configurations of matter with that used to describe subjective experiences of situations, which hasn't been overcome.

All that aside, though, there is perhaps a more important aspect of this as regards "dimensional jumping", which is:

- Why would intention - that is, a direct update to the facts of the world - incur any sort of karmic aspect, since it is “before” the sort of energy we’re talking about here?

In other words, since intentional change is not an action, surely it is in any case outside of a personal causality-based karmic framework, no matter how it is conceived of, and particularly in the case of a "physical" model like we've been discussing?

Instead, intentional change would perhaps be more like the reshaping of the whole landscape simultaneously, via the incorporation of a new fact or pattern. We might have a "karmic debt" in the sense that this pattern would now be a part of the landscape of ongoing experience until it was reversed, directly or by implication, but that wouldn't be related any notion of "good/bad" or even "physical propagation" type concepts, surely. I'd say that "karma", as the word is commonly used, probably wouldn't be an appropriate term for this.

But then, what type of "karma" would there be for such intentional (rather than physical) change, that would be a meaningful guide when selecting intentions and outcomes? That is, other than as a narrative that never really shows itself in actual experience. Is it, as you suggested earlier, perhaps just something that be ignored, since it doesn't actually manifest other than as a sort of story?

POST: Header Change Thought/Question

I'd move away from the concept of a "dimension" as a "place", and instead view it as a "state of experience" (that is, a particular set of facts and patterns from which your ongoing sensory moment arises). And the "you" who experiences this "dimension" isn't a you-as-person, but rather you-as-awareness.

That way, you can view yourself as having taken on a "person-in-a-world experience", but you never actually go anywhere, it's just that the content of the experience arising within you changes (like a 3D multi-sensory thought unfolding within an open aware space). Given this, it makes no sense to talk of what "other people" would be experiencing, because "people" don't experience anything at all. Rather, "people" are patterns which are experienced - by you-as-awareness. You can easily recognise that any thoughts you have about other people, or any other sort of external environment, are in fact just further experiences within you.

For example, note where your thoughts about other people and other dimensions-as-places appear if you do this:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

POST: An Experiment I'm Doing

[POST]

I doubt I'm the first person to do this experiment, though at least in my explanation, doing it will serve a dual purpose. For the past 16 or so hours, I haven't looked in any mirror/reflective surface. I'm doing this so I forget what I look like so I can only experience my ideal appearance (in thought) without any "this is how things actually are" image conflicting with that. I also thought this would be helpful for getting rid of the idea of viewing my body as the "center" of my experience. Even after having realizations of there being no separation in experience, the old perspective of your body being who you are can still come back. I figure with not remembering what you look like as much will help loosen the idea of "being a body" because that idea relies heavily on having a clear mental image. As someone who usually looks in the mirror 20+ times a day, due to being rather preoccupied with appearance, I already feel the effectiveness of doing this for just the short time I've done it so far - there's almost no resistance to feeling as though my ideal is true, because the opposite has no fuel to run off of. I will keep doing this experiment, though I don't know for how long.

[END OF POST]

One possible approach to this - or maybe something to use in addition - is, rather than to try to forget the mirror image, instead recontextualise it.

For example, shift your attention to the idea of a "background space" within which a "sensory moment" of experience is unfolding. From that perspective, an image in the mirror becomes simply a part of this overall 3D-multi-sensory moment-image, and belongs to it rather than to you. In fact, what you are is that within which all of it appears. (Note that when I say "the idea of" I don't mean to think about it; I mean to seek out that background space directly in your actual experience, now.)

To further emphasise this, you should include the "direction you are looking out from" in your attention. That is, if you were to be stood looking at a mirror, your attention is in the direction of the mirror. Now, in addition, extend your attention into the opposite direction, to the space which you are apparently looking out from. You'll typically perceive this to be a sort of "void" that has no end, and then you'll realise that this void is in all directions - again leading to the experience of a void/space with an image floating in it, with you as that void/space and also the image. (This was Douglas Harding's old trick for noticing your actual relationship to experiential content, mirror images included. His books On Having No Head and particularly Head Off Stress are still worth checking out.)

A version of this approach is described in the Feeling Out Exercise, which seeks to recontextualise both your sensory experience and your thoughts about sensory experience, and dispel the notion of anything being "behind" or "outside" them.

Even when I looked at "myself" in the mirror without being in the midst of a realization type experience, I didn't feel very much ownership of what I saw, because it didn't seem like me.

Somewhat like the image in the mirror is part of the "visual wallpaper" of the room; the images of your body parts as you move through the day are part of the "visual wallpaper" of the scene. Just because those images aren't "you", though, doesn't mean we can't want to adjust them. After all, our main strand of experience unfolds "as if" we are that body in that world. If the wallpaper in our house is looking a bit rough, we don't just go "never mind, that wallpaper is not me" and sit in squalor!

(The irony being that, in a particular way, the wallpaper in your house and the mirror image are in fact you - just not in the way we would normally think of it, and not in a way that is burdensome.)

POST: Letting go

So, it's perhaps useful to see that "letting go" isn't something you actually do - although language tends to imply that. There's no technique. If you look for a method, you'll end up doing something else instead but calling it "letting go". First, I'd think of it more like a not interfering after having intended an outcome. The idea being that when you have made a change, then it becomes "true now that this happens then" and any further tinkering amounts to counter-intending. That's why the final instruction of the Two Glasses exercise is as it is. Second, there's "letting go" in the sense of non-attachment. Now, sometimes people say "detachment" but I feel that can get us muddled up with the idea of trying to be separate from what's happening somehow, which would actually be a sort of interfering or holding - the opposite of what you want. "Non-attachment", then, would correspond to allowing the ongoing moment to unfold without obstruction no matter what its content - as above - but also means not trying to "make" things happen when intending. Intention has no inherent sensory component, after all - sensory experiences are always "results". Attempts to force or manipulate experience in order to "experience doing the intending" is basically an intention to create a particular sensation, and if that sensation is associated with your current state, you are effectively re-intending that instead of your target outcome. Generally, it is probably useful to conceive of your current patterned state as the full definition of your world. That "world-pattern" consists of all the current active facts, and therefore fully determines the sequence of sensory moments that will follow. And so, if you successfully shift this via a "jump", then from that point onwards the new target fact has been incorporated and taken into account - even if you have experiences which aren't filled with joy or whatever afterwards, or passing doubtful thoughts or whatever (simply leave those alone). For sure, you might experience synchronicities afterwards, just as a side effect of "patterning" your experience, but there is no reason why you must experience any indications of success prior to experiencing that actual outcome. Basically, this isn't a "signs form the universe" type deal. (In fact, in this view, there is no independent "universe" as we usually conceive of it.) "Letting go", then, becomes somewhat a matter of trust, acceptance, belief, faith and so on - but only in the sense that those tend to lead to you not interfering; they are not in and of themselves a cause of results.

You don't even know how much you've helped me George, thank you! This may sound like a stupid question, but now that I realize that I've been interfering with my intention big time, should I redo my jump minus tinkering?

Why not? Decide to have a clean slate, and begin your experiment again. You can also play with carrying this over into everyday life: for example, lots of people move their bodies by straining and controlling their muscles, instead of, say, intending an outcome then allowing their body movements to arise spontaneously. After all, "body movement" is another experience like any other, the nature of it and its relationship to intention is identical, so that's a good way to practice. For example, sit down in a chair and then intend to be standing up - or to be standing over there by the door, whatever - but don't do anything about it, nor obstruct any movements that arise. By doing this you'll become aware of whether you are, for instance, habitually intending your current position and then having to strain to overcome it, or whether you are intending muscle tension (for "doing") as well as the outcome. (Which would be like intending "stay still" and "move freely" simultaneously, producing the experience of effort and strain.)

One might consider, then, that to intend these unhelpful ways is actually to regularly re-intend your current state, in preference to your target state. "Resistance" to change isn't necessarily about fighting back in obvious ways; it can be more like returning to an overall extended or postural pattern by unwittingly re-intending a part of it. (I don't mean to overstate this though: you are not undoing all your good intentions every time you struggle to get out of a chair!)

Don't get too hung up on that last bit though; there's nothing to be done about them, it's more about recognising the benefit of, and experimenting with, "ceasing to interfere" and allowing the moments between now and the outcome to unfold without obstructing.

Thanks, George! I really needed to read this. I've noticed that it can be hard to perfect the "detachment values" as I call them (I'm a programmer, I usually discuss this all like it's a program, makes it easier to understand). But I've compared it to hypnosis. If you are thinking to yourself "Okay, now I will be hypnotized", then it won't work. You have to just relax and allow to happen. It's not much different here. I wasn't able to get hypnotized for the first time until I was really tired and not really focusing on it. This is when it actually happened. Thanks for this thread, I really needed to read this!

Yeah, I sometimes think viewing things in programming terms - or other mechanistic analogies - can be a hurdle, perhaps, because it tends to imply that there are processes and mechanisms whereby one thing operates on another, which is not the case when we are talking about the nature experience (whether that is unobstructed experience or intentional shifting) rather than its content.

(Further thoughts:)

I do keep returning to a model whereby we have ourselves-as-world as a single patterned landscape which self-shifts, and is static in between such shifts. The only thing that "happens", then, is intention - and that is not a process nor does it have a mechanism. Your ongoing "unfolding moment" appears to be changing, happening, but really it is static from an overall perspective (we could say that "time passing" is a static pattern in our landscape). Which is why you can't do anything in order to be non-attached [1], because any attempt to do so is actually an intention, a deformation or obstruction of the situation which was already there, an example of interference we are supposedly trying to avoid!

Actually, I suppose part of the problem with getting a handle on this is that people assume that in their daily lives they are always "doing" their movements and thoughts and so on, and this means they just don't have the concept of experience just happening "by itself". But if you pay attention to your everyday life, you'll find that this is very much what happens (and that's why doing silly little experiments with body movement can be quite helpful, to dispel incorrect assumptions).

—

[1] Again, I used "non-attached" instead of "detached" there to emphasise that there is no attempt to somehow separate ourselves from experience involved. That's what "detached" seems to imply for some people, even though it is meant to indicate detachment in the sense of "being okay with and non-resistant to whatever arises", rather than putting distance between the (apparent, supposed) experiencer and their experience. Having said that, I do tend to use those terms somewhat interchangeably myself.

POST: Which method to use to achieve future goal?

Just for super clarity, I'd probably highlight issues with the use of "unconsciously" with the word "choosing", because of how loaded that term is, and how varied its uses. It's

easier, I think, to reserve "choices" for intentions, where "intending" means deliberate selection and intensification of a pattern to make it relatively more prominent in our experience ("the intention"). I'd perhaps strip it back to simply: we can intend outcomes or facts - shift ourselves - but sometimes the extended pattern implied by those intentions is not anticipated. For example, you might react to an encounter with someone you like but are shy of by intending them to "go away"; and they do. You could say that you "unconsciously chose" to make it so you never have a relationship with that person, but I think that doesn't really capture what's actually going on. "The unconscious" is a problem because people tend to think of it as both a place and a process, somehow separate from ongoing experience, but which has a mind of its own and does things - whereas it's really just a way of saying "aspects of your current patterning which are not unpacked into this expanded sensory moment", like Bohm's ink droplet analogy. **You are the only mind**, and the state of your world is a static landscape that cannot shift unless you shift it/yourself. You are the only thing that "happens". So, "unconscious" in the sense of not being explicitly aware of what we have done - not having a thought about that - but not in the sense of there being something "happening" behind the scenes. But then, of course, our entire state right now is of that "unpacked" type. Our current patterning is, other than this current "sensory moment", in the background rather than unfolded into explicit knowing (=experience). Only the current "sensory moment" or an explicitly chosen intention, while being intended or recalled, are not of that type.

Perhaps it's a better term to use overall, but it only makes sense if you truly know what you're doing.

The problem is, when we begin with these terms we've already created a hurdle for understanding it properly. "Conscious-unconscious", given that people tend to conceive of these things as "happening" independently in some sense, is already built upon an error and rich with unhelpful associations, some of which are very difficult to point out, to the extent that it's better to put them aside. Of course, in casual conversation, unlike here, then we start with whatever way in might be easiest, and then try to lead things around. But at some point, inevitably, you have to just assert the viewpoint - either by asserting that there is such a thing as "intention" and building out, or by leading them through an exercise like Feeling Out and so on - and build out from that, as a parallel picture of things. In these conversations, naturally, we're all about digging into these things, and I'm not particularly aiming at generating snappy few-liner descriptions that can be given to people without establishing a background first. However, a side effect of this tends to be the generation of new metaphors which can be helpful in that area.

Why would negative feelings arise if that's not what I'm focusing on anymore?

They are aspects of your current state, which will always have some patterning from previous intentions and implications - which typically become less conspicuous over time. (Remember, here, that the state is static, so more accurately they don't "become" less conspicuous, it's just true now that the pattern is less dominant across the static set of moments.)

With passing thoughts and feelings, then, just let them be and they'll just be left behind. Wrestling with the content of every moment is a sure way to get into trouble. If a thought or feeling persists, then intend the desired feeling. And, again, let it be too. You are not meant to be managing your ongoing experience in some sort of constant maintenance mode.

so it does seem like this could improve drastically as I keep putting more focus into it.

I'd say it's not necessarily about "putting focus into" so much as "do not subsequently interfere" - depending on what is meant by that ("putting focus"). This is something to experiment with a bit, but since your intentional reactions to surroundings can be in terms of a depressed state, you can end up recreating it. After which, when you notice this has occurred, you can re-intend feeling good again of course - but: I'd like to caution against "keeping focused on" in some sort of ongoing sense, like a "forcing" more than simple one-hit "decisions". This can become another version of holding yourself in a fixed position in opposition to the moments that you have defined in your state previously. Intention can best be considered as as "redirection" or "assertion", not as a process that needs maintenance, otherwise you are in fact holding a moment, rather than modifying your state while avoiding obstructing the unfolding of your sensory experience. "Putting focus into" in the sense of "intending when I notice that I have counter-intended" is perfectly fine, of course. It's fine to invoke any concept, but we just have to be more careful than we would when discussing other topics - because in this case the thing we are discussing is also about the nature of concepts (or descriptions). Every concept comes with baggage, and accumulates more over time. Worse - "God" being a classic one, but "consciousness" too - many concepts turn out to be sort of meaningless, because we tend not to take the time to define them. (For example, reading "consciousness explained" type articles is often fascinating, because usually - inevitably - the article turns out to be about this other thing, but with it being labeled "consciousness".)

As you pointed out earlier, though, this just means we need to engage in a dialogue to whittle down what exactly we mean by the terms we are using. And I do think that, if we introduce the "meta" idea of "experiencing" as being independent of, the context to, any content, then we've always got a platform we can retreat to in order to regain our footing.

Anyway - There's probably an interesting point to be made about whether or not to treat any content as "important" (or as "signs"). It's best to treat them just as they are actually experienced: multi-sensory 3D imagery, within awareness, with a feeling of "meaning" with it. Any further interpretation is itself a further experience: the experience of "thinking about" that experience. Meanwhile, if you don't regularly re-imply something, then the pattern tends to fade, simply because other intentions towards desired "fact-patterns" will tend to imply the reduced contribution of that something, simply as part of the world-experience being fairly consistent. As I say, though, there's nothing wrong with regularly intending "being happy" or whatever, but this is not the same as manipulating or maintaining the ongoing sensory moment. It is more like "asserting a fact" into the background of experience, such that subsequent sensory moments arise in alignment with that, later. The total simplicity of this does, ironically, lead to lots of verbiage in an attempt to capture it. Ultimately, we are talking about an undivided non-thing - but since words and concepts require division (that is, the breaking up of things into "parts" and then relating them within a "conceptual space"), we immediately create an error even in the attempt to capture it (if we are talking in terms of divisions, we are already not talking about the undivided thing), and flip from zero complexity to endless complexity. Trying to talk about "awareness" suffers from this. It's not a thing at all, and nor is it even the material that things are made from, although that's still a useful metaphor. The concept "awareness" is immediately inaccurate, because simply the fact of dealing with a concept means we aren't talking about awareness-as-it-is, which is "before" concepts. And talking about "intention" suffers from the same issue. Intention is not about entertaining thoughts or feelings or whatever. Intention is the reshaping of oneself, by oneself. "Entertaining thoughts" is a result - an experience. So it cannot be a cause. Experiences are results of intention, so if we find ourselves talking about something to "do", we are already talking about something other than intention. It's actually better to start with the concept of a "state" and have intention simply be a modification of the state, with sensory experiences being aspects of the current state. That way, you have a nice clear model:

You are "awareness". The only inherent property of "awareness" is being-aware. Awareness contains all possible patterns, eternally. Awareness can be in a "state" where some patterns are more prominent than others. Your ongoing sensory experience is the sensory aspect of that "state". "Intending" is the name given to increasing the relative prominence of a pattern ("the intention") in your state, such that ongoing sensory experience reflects that (because it just is an aspect of that patterned state). All experiences are results. The only cause is the state/intention. Of course, this inherently means that neither "awareness" nor "intending" can be described, since descriptions are themselves experiential patterns, and are "made from" awareness. Just like you can't build a sandcastle which is the shape of "the beach" and "sand", even though the sandcastle is both "the beach" and "sand". (And if you make sandcastles and label them "the beach" and "sand", they are still not those things, although it is likely we will get confused and start treating them as such. Which loops back to where we came in, with our unpicking of terms in order to be certain we meant what we think we meant.)

It's not really passive, though, although I get that the language seems to suggest it. Saying that the only inherent property is being-aware is just to say that the "shape" of it is always inherently an experience. It can then causelessly shape-shift itself into any experience (but don't conflate experience with the current "expanded sensory moment" only; something I keep accidentally implying I must admit). Sometimes, as a brief mental image even though it slightly misleads, I refer to "awareness" as:

- "The non-material material whose only inherent property is being-aware and which 'takes on the shape of' states and experiences; right now it has 'taken on the shape of' apparently being-a-person-object-in-a-world-place".

Which is more suggestive of the complete idea. Implicit in this description is that all possible patterns are present eternally, are always available, and it's a matter of the "relative intensity of contribution" rather than their existence as such. Following from that, then: "intending" is the reshaping of you-as-awareness such that a given pattern ("the intention") becomes more prominent in its contribution to ongoing experience; "volition" would be a little bit of experiential or imagination theatre whereby you browse patterns and select one to then adopt more fully.

As always, we should highlight that experience just is and there's nothing "behind" is - and that includes this description, which is itself just an experience (an experience of "thinking about experience"). So, the description doesn't get "behind" experience or "explain" experience, however it provides a framework for thinking about the essence of a structured experience independent of specific content - it is closer to the "basic experience" - and is useful as a platform for formulating intentions "as if" it were true (which

of course intensifies the apparent truth of the description, because whatever patterns an intention is asserted in terms of, is also brought into prominence, as part of its extended pattern).

To avoid going astray, though, so that we don't start thinking that this is "how it really works" or gives us a method or mechanism, we keep re-iterating that the only fundamental truth is the fact of "awareness", and all other aspects of experience are relatively true (patterning, temporarily) only.

The shape-shifting metaphor makes passivity go away, but the adverb "causelessly" seems to bring it back.

The issue here is one of language, again. Language requires that there be a "doer", a "doing", a "done". You can't really describe "movement" without it sounding passive unless you invoke a "mover" - but in this case we are talking about self-shaping or self-movement, with no "mover" distinct from the "movement", because of course you are the entirety of the experience.

As an attempt to illustrate this: move your arm. Attend to the experience. Do "you" actually "move" your arm, or does the experience of "my arm moving" simply arise? In what sense do you "cause" your arm to move? If you have an experience of "doing" the movement, then what causes that experience? Is it not itself a causeless experience, in terms of there being something within your experience that makes the arm move? Is it not the case that the entirety of your ongoing experience is a "result" and not a "cause"? Something to play with, anyway.

So, there's nothing "behind" it, but maybe there is something inside it.

Again, this is perhaps best viewed as an issue with language and conceptual thinking - which always involves arranging object-ideas within a conceptual space, almost like as sort of imaginary "thinking room". There are in fact no hierarchies or locations in what we're talking about here, but there's actually no way to talk about this, since thinking requires division and relation, which is "after" this.

So, really, we must simply accept that we are using metaphors to point to aspects of our experience, and sometimes those metaphors will apparently even clash or contradict one another in the details because they are all "wrong" to an extent. The descriptions we are using aren't "explanations" for our experience, they are our best attempts to communicate insights that are observed. "How things are" is never captured by the description, never are them; the descriptions merely point to them.

The implicate/explicate orders are one useful image, certainly. But: the implicate order is not actually intended to be spatially located at all, since it is "before" even the formatting pattern of "spatiality". It is useful to refer to it as "enfolded within" our experience, because it gives a sense of the relationship, but the spatial metaphor is not really accurate (since only spatially-extended experiential content has spatial extent and this is not that).

Similarly, the "patterning" model tries to use the concept of patterns or ripples, all existing simultaneously and summing up to a state. A bit like Moire fringes. The idea here is to use the minimum required concepts to represent a structured experience, whilst avoiding invoking spatial or temporal metaphors as much as possible. The "sensory aspect" is the current "unfolded" part of that total image, in this description: sensory experience is spatial, but patterns themselves are not. But again, that description is not "true" because no description can be; it is simply an attempt to capture certain aspects of experience such that they can be discussed and, then, used as formulations for intentions.

The summary, then:

Experience is as it is and is primary; descriptions are pointers to that and are themselves experiences, so it is not possible to have a model which is experience. There is actually no "how things are" or "mechanism" or "structure" which is inherent. Models are meant to be "effective" (that is: useful) rather than "true", so arguing about the models can sometimes be a distraction, and that's why the sidebar encourages conducting experiments.

Aside - Models are never "true" even outside of this more "meta" analysis, although unfortunately they are often presented as such at the moment by many people who really should know better. Even in the standard description, the world is not actually, say, made from "atoms". That model was never intended to capture "what is really happening"; it is simply a useful - "effective" - description for many purposes. "The atomic world" (a certain conceptual framework) is made from "atoms", but the-world-as-it-is, experience, is not. See, for example, two handy articles: The mental universe [<https://henry.pha.jhu.edu/The.mental.universe.pdf>] and What's bad about this habit [<https://www.ehu.eus/aitor/irakas/mes/Reference/mermin.pdf>].

When seeing this, it seems kind of pointless trying to meddle with whatever you're experiencing, because it's not seen so much as an impediment to get somewhere else.

Another way to say this is: If all things already exist, and they are brought into experience by intensifying them, then trying to tinker with the content of the moment is misguided, or at the very least it is limiting. There is no need to "transform" the current experience into the desired one; one simply needs to assert the desired pattern into relative prominence.

Furthermore, the very idea of trying to operate upon the "image" is (in this context) really in error, because the current experience is a result or sensory aspect, and is not the fact itself. That is, if the sensory aspect is the flames atop a stack of glowing coals, their shape reflecting the arrangement of the stones from which the flames arise and are a part, then trying to modify the flames, while it may adjust their position slightly, does not tackle the pattern of which the flames are merely a visual aspect.

You needn't be parroting positive things to yourself all day, but if it arises for a while, then go ahead. If negative stuff like "I look like crap" arises, then let that be there, just don't be interested in it. Does that sound accurate?

That sounds accurate.

The notion that one must always be "feeling good" or "thinking the right thoughts" - as passing aspects of experience - in order for the desired outcome to arise, is flawed. There are two aspects to that:

First, those feelings or thoughts are results. Like the flames above. Altering the flames does not alter the facts or the state, beyond perhaps a little intentional extended patterning. The flames are not casual. One moment does not cause the next moment: they are both images arising from one's state, which is a static definition which fully determines the sequence of moments (that is, between occasional intentions/shifts of course).

Second, if you intend a particular outcome, then at the moment of intending the state is shifted (because intention is the shifting of state) such that the new fact-pattern ("the intention") is incorporated. At that moment, it becomes "true now that this happens then", with the series of moments between now and then being fully defined by implication. But:

There is no reason why all those intermediate moments will be filled with "loveliness" and "joy" or "signs of success".

A silly example: If I intend to bump into someone I am attracted to, this may actually come about because I wake up one morning feeling depressed and hopeless, this lasts for a week, eventually I decide to take a walk and go for a coffee in that new coffee shop that's opened even though it's not my sort of place and shake myself out of it, and they happen to be in the coffee shop.

You could say everything falls under that rule, since there is no division...

That's where the idea of this all being paradoxical comes in. It isn't really, though - the paradoxes lie in our attempt to construct a conceptual framework for it, not in "the thing itself". It's generally convenient to have "awareness" as indescribable, but notionally something like:

- "The non-material material whose only inherent property is being-aware but which 'takes on the shape of' states and experiences - and which has presently 'taken on the shape of' apparently being a person-object in a world-place".

but is it fair to say that you wouldn't be entertaining those thoughts unless you already intended the outcome in which the thoughts are related

I'd suggest that it's better to side-step this because it implicitly suggests a deliberate causation that isn't necessarily so, plus a notion of an initial starting point which doesn't exist.

If "awareness" is eternal, and all possible patterns exist eternally, then there is no time (in fact: no time!) where there wasn't a patterned awareness. In that context, saying that our experience (of "the world" or of "thoughts", the same really) is only because we intended the outcome is misleading, potentially.

If we reserve "intention" to refer to our deliberate intensification of a pattern, we're on better ground, and our current state is a the sum of all intentions and their implications (their implications given that the intention is a modification of an existing state). These intentions may not be about outcome events as such, though. If you intend the experience of the image of an owl in front of you, then that is an intention (bringing into prominence the experience of "an owl image" and also the extended pattern of "owl") but it is not necessarily a selected outcome. You have shifted your state, but the results are not so clearly defined as having intended an event.

Intentions, then, can be really quite abstract, and not necessarily structured as events or objects or world-facts - that's why I use the concept of "patterns", since it does not assume a spatial or temporal aspect.

From here, we can loop back to the idea that because there is no division, because the "world-pattern" is continuous and undivided, then if there is any "world-fact" at all, then there is immediately, by implication, an entire world. That is, if the world-pattern was a metaphorical landscape, then as soon as there is anything other than uniformity, any slight hill or valley, then there is immediately a full topology. This is why we can't say that it is the sum of deliberate choices, but we can say that it is the (effective) sum of all intentions and implications, even if those intentions are not in the form of "choosing world-events or world-facts" or whatever.

If the above explanation has any weight, then intention is the cause of you letting go of another pattern, right?

So, if the world-experience is to be a self-consistent thing, then bringing one pattern into relative prominence will, simply from the property of a continuous pattern, mean that contradictory patterns will be relatively reduced. If you select "happiness" into prominence, then that is also a reduction in "depression". You don't "detach" from anything, though. I think I know what you mean by "attaching" to a sensory experience, but for clarity it's better to say that you increase the prominence of a pattern, and that pattern implies a particular sensory experience, subsequently. There's also a bit of exploration to be done in terms of what something like "depression" is. If the way we change our state is by, essentially, "leafing through" potential patterns by a sort of "associative browsing" of the eternal memory of all possible patterns, there's an interesting issue to ponder. That is, there's perhaps a difference between identifying and increasing or decreasing the pattern which is associated with the word or concept "depression" (following the word!), versus identifying the patterns associated with your actual experience, and increasing or decreasing that (following the direct feeling!). They may overlap, but it isn't necessarily the case. Because experience and intention are "direct' (that is, there is no intermediary), it's important to actually attend to the pattern itself, rather than just a proxy, or at least ensure the proxy means-that you are addressing the pattern itself. Aside - I'd like to highlight here that none of this is an "explanation" in the sense of explaining "how things really work". The overall insight is that there is no "how things work", no mechanism or method. What it does instead, is propose a conceptual structure which is the minimum required for discussing a structured experience without specifying any particular instance of content. And then, it is also a structure which can be used to formulate intentions and conceive of their potential impact, while avoiding the associations usually implicit in more content-based descriptions (of which this is the "meta" perspective).

TriumphantGeorge Compendium - Part 13

POST: The world does not seem like a private dream

But I can't deny that this "world" does not feel like a private, subjective dream.

The sense in which it is a private reality or view, though, is not in the sense of it being a personal view. That is, it is not you-as-person who "owns" the experience, it is you-as-awareness who has "taken on the shape of" the experience of apparently being-a-person-in-a-world. This world which is patterned, typically, as an apparently "stable, simply-shared, spatially-extended place unfolding in time". The thing we explore is the extent to which that apparent default corresponds to some solid independent thing, as we tend to assume. This can get tricky, though, because we are always investigating in terms of a perspective (a world view, plus a desire or lack thereof). For example, if you were to intend something from the perspective of a person, then the ongoing experience of a personal viewpoint is implied within your intention, because you have intended in terms of it. This includes intentions which try to wrestle with it, to transform it (since those are also in terms of it; they re-imply the pattern) rather than intentions which detach from it. We have to keep this in mind, then when we are investigating whether you can have experiences "as if" it were a shared world and/or "as if" it was a private view. The main possible outcome is that there is nothing actually "behind" your experience (or rather: behind "experiencing"). Experience is patterned that-which-experiences; patterned awareness, you might say. So the only fundamental truth is that there is a property of "awareness"; all content is relative. You can't experience that lack of such a thing directly, though; you can only have experiences so varied versus your initial assumptions that it becomes obvious, by deduction or direct intuition, that it must be the case. And so, we might conclude that there is no persistent "how things are", and...

My attempt to understand why and how it works is probably making it harder for me to find success in this, so I'm going to try to stop caring about how and why it works.

...there is also no "how things work".

Here, the notion of "patterning" is an attempt to have description which doesn't end up assuming or implying some sort of "mechanism", because apparent "mechanisms" and "how things work" are themselves simply patterning of experience.

One implication of this is that if you focus on a particular idea of "how things work" - whether you are seeking evidence for it or seeking evidence against it or simply thinking in terms of it, implicitly - then you tend to get experiences patterned accordingly, to some extent. (Making investigating somewhat difficult.)

And since it is all "you" (as in you-as-awareness), you can't really deliberately make yourself intend an experience that you don't commit to, don't really think is possible, or don't actually really like the notion of. It's hard to fool yourself into something you don't want, when there is no "outside" of you that you can use to fool.

"People as patterns" is one such unattractive idea, for many. Although it doesn't actually end up as solipsism, people often anticipate that it will, and that's an unattractive idea: that there is only "me". (Even though it is not that "me" that we are referring to.) The idea of an unstable, non-"location" world is also pretty unattractive idea for many, also.

To return:

But I can't deny that this "world" does not feel like a private, subjective dream.

Then it isn't (currently, in your understanding of the concept).

It is not ever "really" that anyway, of course, I suggest, but you can have experiences "as if" it were that (corresponding to your notion or description of such a situation). Doing so reveals the more important observation that, fundamentally, "the world" and "you" are not "really" any-thing, other than the experiencing of those apparent things. This is always true, and your descriptions and concepts about the world and you are "parallel constructions in thought".

Although - it would be good to ponder what it would "feel like", in your view, if it were a private, subjective dream. Are you anticipating that a simple wish would bend the world accordingly and instantly? What would be the signs of a private, subjective dream, for you? Because it might be that you are really thinking about something else, here. That is, a private, subjective dream where there is no stability - basically just a dim and transitory thought - rather than a stable one, that is like a bright and persistent thought.

Have you ever had a lucid dream where characters seem independent, have their own will?

This is a catch 22.

Somewhat, it may seem.

However, it is possible to commit to something without regard to belief or disbelieve, liking or disliking. So it's about no longer indulging in thinking about possibilities or lack of possibilities, wheher something makes sense or not, is appropriate or not. Instead, it's about treating it - as we might say - as a "dumb patterning system".

In a dumb patterning system, holding a pattern in mind - we might saying "thinking it" or "intending it" or "imagining-that it is true" or "thinking the fact that something is true" or "shifting state", although there's really no way to describe it - intensifies its relative contribution while, simply because there is only "one thing", intensifying its extended logical pattern while diminishing anything contradictory to it. It doesn't matter whether you "believe" in it or your view of it in moral or potential terms, therefore, so long as you don't spend a lot of time holding a contradictory pattern in mind (during the intention, or subsequently). An example of this would be, not so much believing, but resisting the urge to indulge in "doubting", in the form of imagining-that something contradictory to the outcome, or fact, is true. (Which is a sort of faith, really, I suppose; or a willingness to allow. Mentioned again below.)

This does lead to something else important, though. That is, that the exact pattern that you are holding, its form or content, does make a difference. You might say to me that, for instance, you have been "intending to win the competition" - but the thing you are actually doing may in fact not really be that, not in the sense meant above. The structuring you are using needs to correspond to the structuring of your conception of experience, in some way, in terms of meaning.

Just simply summoning a picture of you on a winning podium for example, probably won't do much, probably bringing about some coincidences in the same way that the owl exercise brings about the extended pattern of "owls" in a sort of general overlay.

[private, subjective dream] But I do think reality would be a lot more responsive to my intentions, and nothing would be outside of my control.

I suggest that a private, subjective dream does not have any specific inherent properties, because any content could fit into that description (including that of apparently being in a physical shared world). There is no difference in nature between a flexible lucid dream and everyday life; what's different is the level of inertia, the depth of the patterning (metaphorically speaking). However, that "depth" or "inertia" is itself patterning of experience, and one can experiment with it.

But it does take some commitment, which isn't necessarily easy to come by when the world seems "so obviously" a stable and external place (except when it suddenly isn't for a moment). I guess that's why people talk about needing "faith", since there often isn't any sensory experience corresponding to an outcome - until there is. (It's also why this subreddit, for example, uses the perspective of this being an "investigation", where nobody else's ideas, including mine, should be taken on trust.)

[lucid dream characters] as soon as I became lucid... and they were no longer autonomous as they were when I wasn't lucid, so it ruined the fun.

Well, there is something of a lesson in there, perhaps. It is however possible to create (or should I say, summon the patterns into experience of) autonomous populated worlds: "persistent realms" standard link, and so on. Basically the same as this current experience.

As I mentioned before, though, it's important to note that the dream comparison/observation isn't saying that "you are the only real person and it's all under your control". Rather, it's that you aren't real either. (Where by "real" I mean independent and external to direct experience, separate and solid and "out there".)

The only thing that is "real" - which is to say, unchanging and therefore always true - is the fact of the property of being-aware, or "awareness". This is something you could conclude from noticing the content of everyday mundane experience, of course.

I can't tell if I ever actually successfully intended something.

You can sort of "know" you are intending, but unless the result of the intention overlaps with the sensory aspect of the current moment, then there's no "experience" of intending as such. There is no "doing" involved; it's a sort of "shapeshifting" or "becoming".

This is true even of things like deliberately moving your arm: you intend the fact that your arm is going to move, a short time later the experience of your arm moving is encountered in the senses. As an exercise: move your arm, and try to find yourself "doing" it, find the "cause". (If you then ascribe it to you having a thought of "lift my arm", then take a step back and try to find the cause of that thought. And so on.)

Aside - To reemphasise, here, "intending" means "to increase the contribution of a fact or pattern to ongoing experience" and "the intention" is "the fact or pattern whose contribution is to be increased". (And the pattern or fact already exists, eternally.) There really isn't any good way to describe it in words, to be honest. It just is. Language tends to divide things into a "thing", a "thing doing" and a "thing done". Here, though, they are all the same. This problem also arises when trying to describe the nature of "you" (you are that-which-experiences and the content of the experience and its context).

POST: Base Patterns... "Shared?" patterns

I see /u/Scew has helpfully replied already, but I'm not going to read his response before writing mine, and that way we'll get a couple of angles on the same topic, and maybe even something to enjoy disagreeing about! Here goes -

Scene Setting

I think I'll begin by just layout out the bare-bones description of our situation, so that we're all talking in the same terms, and then I'll focus on the points your raise in your post. So, we have something like:

- "Awareness" is the non-material "material" whose only inherent property is being-aware. This fact is the only thing that is fundamentally - that is, unchangingly - true.
- Because awareness is "before" division and multiplicity and change, awareness is not an object; it is not a thing. Awareness itself has no edges, and it makes no sense to talk about "an awareness" or "the awareness" or "my awareness"; it is simply "awareness".
- Awareness can take on the shape the 1st-person experience of apparently being a particular thing, however it is always actually all of the experience.
- All possible facts, patterns and experiences already exist - and can be thought of as being "dissolved" into this awareness.
- What you actually are, is awareness.
- Your current experience corresponds to the distribution of intensities of these patterns, their relative contribution to your overall state.

To illustrate this to themselves simply, anyone can close their eyes right now and try to:

- a) find the "edges" of your current experience,
- b) find where "you" are in your current experience.

What you discover is that, although you are apparently "over here" and the screen with these words on is "over there", actually you discover that you are "everywhere". Upon closer inspection you recognise that the whole experience is "made from you", and that there are no edges to this experience/you; there is no "outside" to your experience.

It's worth emphasising here that the sense in which awareness "takes on the shape of" an experience is in the sense of a 1st person experience. This is not saying that "the world is made from awareness" in the same sense as one might say "the world is made from atoms" - as a spatially-extended place "out there" with "you" in it. Rather, awareness takes on the shape of "sensory moments" which are aspects of a state, a state which corresponds to a particular dissolved "definition" of the world - a "world-pattern".

Therefore, it is meaningless to talk about space and time outside of experiences. And, in fact, your thoughts about such things are themselves experiences formatted in terms of spatial and temporal patterns. If you are imagining an outside of awareness or experience, you are immediately "wrong" and that imagining is "inside" awareness/experience.

Patterns & Pals

For this next bit, I'm not exactly sure what you were asking, to be honest - hopefully the outline above will help tease out any hidden assumptions there might have been, and we can better pinpoint where there might be a misunderstanding. In the meantime, though -

it seems like there is a point where "base" patterns are defined and are not quite as easily controlled/altered/influenced via intent.

I think it can be helpful to outline some groupings, perhaps. The patterns that contribute to your current experience would include: base formatting (spatial extent, change), world formatting, general world facts, perceptual formatting, outcomes and event patterns, abstract patterns overlays, and so on - all giving one single resultant pattern or state.

Here, the base formatting could be viewed as being the most intense or deepest of the patterns - we're basically talking about the abstract patterns that mean there is such a thing as apparent "division" and hence "objects". To stop having an experience in terms of that is difficult - a void experience - because everything you intend as an action will tend to further imply those patterns! Which leads us to an important point:

Patterns become more dominant because either we intend them, or because our intention implies them. If you intend walking to the door, then that intention already implies the pattern of the room, the door, a body, plus spatial extent and temporal structure. In fact, one might say that every intention implies a whole world, because for an intention to have meaning at all, it must be part of an extended pattern, an entire context.

This is important to realise, because it flips our usual thinking around. It is not for us to examine the current world and then work out the best intention given that world - all we are doing, then, is re-asserting the current world. Rather, we select an outcome and implicit within that intention will be a world that has that outcome as part of its extended pattern.

It seems that it would make sense that the base pattern is a composite/aggregation of the many shapes/experiences/patterns from awareness.

From the above, we have that all possible patterns already exist, and any state is an aggregate of every pattern, just at different levels of contribution.

I don't think each pattern (me/you/others) would independently render/create all the content of experience for its entire private copy of the "universe".

First, "me/you/others" doesn't make sense in this context; there are no independent people at all. No person ever does anything. There is only "awareness" and it is the only power - which is, to reshape itself.

Secondly, that sentence implies that the world is "designed" - that facts are deliberately chosen. This is not the case. From a single intention, a whole apparent could be implied - that is, a sequence of experiential moments "as if" a world existed and you were a person in it. "Creation" is already done, remember; everything already exists. What is happening might be better termed as "recall" from a memory block, or associative thinking in the form of a strand of 3D-formatted multi-sensory thought. Meanwhile,

there is no "mechanism" involved in this; nothing is "rendered". Intention is the only "mechanism" and is the only thing that ever truly happens. (See also: The Hall of Records for a metaphor of this type.)

Take the case of direct-entry lucid dreaming. You lie down comfortably, allow you body and mind and attention to release, wait patiently and passively until hypnagogic imagery begins: sparkles, shapes, image fragments, visual objects, eventually a scene appears, and then that scene pops into a 3D-immersive environment. From that single scene, that single 3D-immersive multi-sensory "frame" or "moment", an entire world is implied! For sure, it is based on the current relative distribution of abstract patterns active as your state, however the dream world, in terms of its "facts", was never deliberately chosen or designed. And yet no matter how far you seemingly wander, that world will have no gaps or edges.

So it is, I suggest, with this experience you are having right now - this experience taking place "as if" you were a person in a world reading words on a screen.

My question is centered around how these "infinite" shapes of experiences might contribute to the formatting (patterning) of one another.

So, I would suggest that they don't, as such, but just as you say, it can be tricky to keep our terms in line, and I think what you are getting at towards the end of your post corresponds to how I'm thinking of it. But to be super-clear, let's pick out a couple of things below.

Note: because of the nature of the topic, it's sometimes difficult to pick out what is being assumed, so sometimes we might say things that seem obvious, and sometimes it may seem we miss an obvious point. In other words: just pick away at whatever doesn't make sense, and obviously my own description might actually be inconsistent anyway!

World, Context, Division

Should I call this world level pattern a context, a stage?

I'd call it a state, because I feel that "context" or "stage" implies that something is happening inside of that pattern. I'd say that awareness is the context of all experience, which adopts a state corresponding to a particular relative distribution or intensity of all possible patterns, and that everything else is best considered as content. Between a intentional shifts, the state is completely static, and fully defines all the moments of experience. Even "time is passing" is a static pattern.

I take Awareness dividing (achieving multiplicity) to mean it is taking on ALL the possible shapes of experience.

Okay, but to be clear: when I talk of (apparent) multiplicity, I don't mean that it is splitting up into separate perspectives which are all "happening" at the same time. I mean it in the sense of you apparently being "over here" while the screen is "over there", even though upon inspection you realise that "you" are actually everywhere and all of it.

And: the only thing that is "happening" is your experience right now. "Time passing" is an aspect of the current experience, and does not exist outside of it. So there is nothing happening "at the same time" as this experience of the pattern being-a-world-from-the-perspective-of-a-person.

The State of George Washington

There is a shape of an experience of a George Washington who founded the United States.

There is, implicitly, and there is every other type of experience too, just dissolved into the background, ready to be intended into relative prominence, such that it becomes the current state/experience.

This is also a 1st-person perspective experience unfolding in time in "a world".

But it is not "unfolding in time" right now. And the 1st-person perspective isn't "in" a world. It is a state that you could switch to, and if you switched to it, then that experience would become what is "happening" now. At the moment, though, it is just an eternal pattern sat in the background.

That shape of an experience is only one of ALL possible experiences but is still "just" Awareness.

Right. So let's summarise this model so far:

- There is "awareness"
- Dissolve within awareness are all possible patterns, and those are eternal.
- By selecting a particular combination of patterns, awareness becomes a "state".
- That "state" might be conceptualised as corresponding to a certain list of facts - a combination of a particular set of patterns, at different levels of contribution - which define a world and a perspective upon that world, and therefore defines a certain experience.
- One such state/experience might be being-a-world-in-1790-from-the-perspective-of-George-Washington.
- Another such state/experience might be being-a-world-in-2016-from-the-perspective-of-djdu982.
- If a state is not activated, then it is not "happening".
- The "happening" of an experience amounts to, you might say, "scanning one's attention" across the moments defined by that particular state, basically unfolding it moment-by-moment into the senses.

So there could be a "me" state that has a world aggregation pattern that involved a George Washington pattern contribution.

So, if what you mean there is that there exists a state (an aggregate pattern) which corresponds to the experience of being George Washington, then yes that would be correct. In order to (apparently) be George Washington, awareness would "take on the shape of" that state, instead of the current state. From this we see that you-as-awareness has no permanent "me"-ness about it, other than being-aware and being able to adopt any state/experience "as if" it were true.

"George Washington" doesn't contribute anything, though, because he is not a being and doesn't create anything. There there is no "shared" aspect to the different patterns as such - they don't contribute, they just are and can be - but all such patterns are available to adopt as a (logically self-consistent) experience.

Aside - There's a whole tangle we can get into about "other people" and "other perspectives. The convenient placeholder for that is to point out that the world is not a "shared spatially-extended place unfolding in time" and instead is more like a "shared toy box of potential patterns and experiences". The benefit to this isn't that it is fundamentally correct (because awareness is "before" all time and space notions anyway), but that it avoids making the usual errors of thinking - e.g. that things are happening at the same time in parallel, or one after the other in sequence, when both of those descriptions are actually meaningless rather than wrong.

The "Moments" Metaphor

My assumption I guess is that all of these states are active.

To give ourselves a simpler way to conceive of this, we could temporarily move away from the abstraction of "patterns" and take a subset of the idea. Let's consider it as all possible "moments" being present, now - a "moment" being a 3D multi-sensory 1st-person frame of experience - but at different levels of intensity.

So, right now, both the moment of "I am sat here looking at this screen" and the moment of "I am in the kitchen holding a mug of coffee" are present, however the former is turned up to full brightness and the latter is dim. Similarly, "I am George Washington chopping down a cherry tree" is also present, but dim.

Would not all possible pattern combinations have actually been experienced by awareness, meaning activated and happens?

The problem here, is that you are still referring to things based on some sort of external reference time, which doesn't exist. Awareness doesn't have a record of history beyond its current state, as the eternal Now, and all so-called memories of apparent recollections of "past" experiences are themselves actually "moments", now (experiences of "remembering the past").

Imagine a landscape with a particular set of contours. I am a gardener who has no memory capacity. I modify the landscape. Where is the old set of contours? Perhaps I call hills in one region of the landscape "the past" and other hills in another region "now" - but actually the entire landscape is Now, and if it changes without leaving a trace in the region I've labelled "the past", then there is no record of it. Note: Even this description is incorrect, because its construction is based on a notion of an 'outside' time perspective.

Eternity vs Forever

Same question different wording: Would not all possible pattern combinations have actually been experienced by awareness, meaning activated and happens?

We might be tempted to say that, given eternity, all possible experiences must have been experienced. However, this confuses "eternity" with "forever". The latter has an implied time components; eternity has no time component, it is outside of, or "before" time.

Maybe this is where "dissolved" comes into play?

Right. So, referring now to the top of this comment, we have a better way to conceive of things. Rather than talking of the experience of all possible combinations occurring sequentially or in parallel, in time, we instead take on the notion that all possible "moments" (and patterns) are always being experienced, Now. At this moment, which is actually the only moment, you are experience everything, just with a different relative distribution of intensities or "brightnesses". All "moments" are Now, as This Moment, and it is eternal. Every "moment" is the experience of everything.

[Dissolved] I do not fully get this meaning.

The use of the "dissolved" metaphor in general is meant to be an accessible way of conveying that you can be experiencing something, now even though it has not been "unpacked" or "unfolded" into sensory objects. In fact, if you pay attention to your direct experience more, you'll discover that there is this felt-knowing which is like the "global summary" sense of your state, and it is that which is your "knowing" of your current moment, more than the visual and auditory aspects of the experience.

Dissolving & Divisions

Are the "dissolved" patterns like the many many colors on a painter's palette? can be combined in any combination or intensity. All of these colors are available to be experienced in any final "state", but does not become "active", or a state, or experienced, until the colors end up on the canvas?

That's a good metaphor - except that we want to avoid there being an implication of division or process. By this, I mean we don't want to depict the colours being "over there" and then we select them and paint a result "over here".

You'll notice that with metaphors such as the "imagination room", they are at pains to try to remove the separation between the "components", the "scene" and the "experiencer". Hence all that stuff about being "an awareness which 'takes on the shape of' experiences"; the shape-shifter as metaphor removes all sense of separation. However, we always end up having to introduce something of that sort because we need to convey that there is a potential within the shape-shifter, even though it is not his present shape.

Another approach to this is David Bohm's idea of the implicate and explicate orders, as described in his book Wholeness and the Implicate Order. He uses the physical example of a column of glycerine. From that Wikipedia entry:

Ink droplet analogy

Bohm also used the term unfoldment to characterise processes in which the explicate order becomes relevant (or "relevated"). Bohm likens unfoldment also to the decoding of a television signal to produce a sensible image on a screen. The signal, screen, and television electronics in this analogy represent the implicate order whilst the image produced represents the explicate order. He also uses an example in which an ink droplet can be introduced into a highly viscous substance (such as glycerine), and the substance rotated very slowly such that there is negligible diffusion of the substance. In this example, the droplet becomes a thread which, in turn, eventually becomes invisible. However, by rotating the substance in the reverse direction, the droplet can essentially reform. When it is invisible, according to Bohm, the order of the ink droplet as a pattern can be said to be implicate within the substance. In another analogy, Bohm asks us to consider a pattern produced by making small cuts in a folded piece of paper and then, literally, unfolding it. Widely separated elements of the pattern are, in actuality, produced by the same original cut in the folded piece of paper. Here the cuts in the folded paper represent the implicate order and the unfolded pattern represents the explicate order.

No analogy is perfect for this - it is inherently impossible to have a metaphor which is complete here, because as soon as we make a division we are "wrong", which basically means as soon as we think about it we are "wrong". So the best approach is to consider lots of different metaphors which are "wrong" is slightly different, non-overlapping ways, and we eventually build up a direct intuition for the situation - like that felt-sense I was talking about - which does not need to be unpacked into mental objects; it is "immediate".

So same question a 3rd way, has awareness painted all the possible paintings?

Hopefully the exploration above has covered that in a way that makes sense: all possible paintings are here, now; it is not meaningful to talk of paintings in history, because awareness is "before" time.

Can there only be one shape or state that awareness has active?

Yes, but that state is infinitely complex of course - and yet totally simple: because it has no inherent division. Which leads us to...

The Simplicity of Experience

Once again, it is important to emphasise that what we are discussing above is a description, a metaphor, a "parallel construction in thought". It is not "how things really are" or "how things really work", because there is no "how things really are" or "how things really work". Actually, the only thing that is fundamentally true is being-aware. Everything else is relatively true only - that is, we can have experiences "as if" they are true, by intending the formatting of experience or intending outcomes which imply a particular formatting of experience. So, what we are trying to do in the above is produce a description which is the more flexible coherent model which makes sense - which can be used to describe any experience as a sort of general narrative, and which can be used to formulate intentions without implying a restrictive world-view. This is only one side of our explorations into "the nature of experiencing"; the other, primary one, is to attend to experience as it actually is, and therefore directly realise our situation, rather than just think about it.

From a previous comment:

Experience-Of vs Thinking-About

Awareness doesn't have a location - it is that which takes on the shape of experiences. Everything you are experience right now is it, and it is what you are. The body is an object of experience, awareness is the subject of experience. You don't need a body to experience, however experience requires a context for its content. Awareness is that context, and all experiential content arises within (and as) that context.

You can think about this forever, but it's really something that is directly realise. For example as in the comment above, say, where you close your eyes and try to:

- a) find the "edges" of your current experience,
- b) find where "you" are in your current experience.

and:

- c) investigate what your current is experience is "made from".

Those observations are the facts. Everything else must adhere to those facts.

The only thing that is "real" (unchanging) is "awareness" - otherwise known as being-aware, since it has no inherent structure beyond that property. Everything else is temporary, which is to say relatively real/true only.

You still seem to be reaching for a "realness" which is "behind" experience, but there is no such thing. That is the meaning of phrases such as "what is seen is seen". It's trying to convey that what is seen is what is seen - and there's no more to it than that.

Narratives and the like are just a way to formulate descriptions of what has been observed so far, of what is currently observed as part of the present state, and to formulate intentions. Beyond that, though, there's nothing "insightful" about them at a fundamental level. Fundamentally, there's just being-aware and whatever is currently being-aware-of. If you want to experience something, the only way is to think about it, intend it, in the 1st person, "as if" it were happening, until it becomes intense and stable, so that the "as if" persists. You don't do this - rather you become it, until it is fixed as (relatively) true. This is, in fact, your current situation, in aftermath.

basically keep pretending until it happens
this involves persuading myself
but who am i persuading?

No, not pretending or persuading like that. You keep splitting things in two!

Pause this moment. Now, think of a red car. Really, this is better phrased is "think a red car into existence within your perception, albeit a low-intensity one" - or "think a red car" for short. So, now you have a red car. Did "you" think of a "red car"? Where, exactly, in your experience, is this "you" that did the thinking? It is nowhere/everywhere. It turns out that "you" do not think the red car, in the sense of being a separate thinker. Rather, the red car is within you, you as a subject or context (and not an object). If you were to keep "thinking a red car" it would become more stable and persistent as an image. Now, instead of "thinking a red car", you do "thinking being inside a red car". That is, you are not just seeing a red car from some outside vantage point, rather you are experiencing a full multi-sensory 1st-person frame of being in a red car. Consider what it would be like to hold that "being inside a red car" thought until it became stable, persistent, intense, brighter than your apparent present surroundings!

That is what is meant by intention until it is fixed. No persuasion, no pretending in the sense of a separate subject and object. It is a becoming-asserting or "thinking the experience something-being-true". (Language forces upon us a subject/object division here; we are forced to get creative in order to indicate that's not what is meant.)

it would require me to do some things to acquire the experience of being in a red car

Do some things - how? You "shift" yourself, there is no "doing", which means one "part" operating on another "part". And even then, language makes it sound like some sort of action, when it is not really. There's a risk, here, that you are being distracted into wrestling with conceptual shadows, both modern and old, which are intended to point to things, rather than be things you spend time manipulating.

i do things like go to the car rental place and rent a red car

Not necessarily. Yes, if you just set it as a fact. But if you truly stayed with the image until it replaced the current one, you would actually be in that situation. Of course, this might take a while, but that would be up to you, whether you'd persist with the experiment or not.

right but i can't do something that doesn't exist

Everything exists already. If you can think it, it exists. There is no other sort of existence. If you can think about or of something (from a 3rd-person perspective, like imagining a car over there, as a normal thought), then you can think it (from a 1st-person perspective, as we were just discussing). There is nothing more to it.

Again: to think of something is to experience it - in the 3rd person. All that remains is to think of it in the 1st person, and then you are "living it" rather than "thinking about it". It is identical in nature: intensifying imagery within awareness. (This applies to more abstract facts and patterns too; it's not just restricted to having an expanded audio-visual-texture thought, although it gets harder to describe beyond that.)

ok well i just want to focus on meeting radha

As in, because it would be a cool experience? Fair enough! :-)

POST: Repetition vs Detachment

I think one of the problems we have with this topic, is a lack of clarity as to what "detachment" means. What are we detaching from? Is it our desire? Well what exactly is a "desire", and what does it meant to be attached to it? Similarly, if we repeat an intention until it takes hold, we are led to ask what is an "intention" precisely, and what does repetition do that helps it to persist? And why would that result in an outcome anyway?

Without having answers to these questions, we end up having all these concerns about maybe undoing our intention inadvertently, perhaps worrying that accidentally thinking about our desire is spoiling our "forgetting" - all basically a type of superstition due to the absence of a definite model to refer to. (I'd say that the LOA stuff particularly suffers from this.)

It does seem a little simple that repetition might be a replacement for intensity...

So, increasing the intensity of a pattern could happen all at once or in stages, that seems fair enough. But where "detachment" comes in, would be not re-intending the old pattern, or intending something which implies the old pattern, or intending something which logically conflicts with the new pattern - such that the relative intensity of the pattern never reaches a threshold beyond which it becomes the dominant "fact". For things which "matter" more to us, or are related to things we experience all the time, I think it can be harder to not do this - because we're often continually re-asserting our current position all the time, and implying the larger state connected with it. For a mundane example, say you've developed a slightly offset habitual posture, and you compensate for that by constantly, lightly intending against it with an upright tension as you move around. By doing this, two things are happening: firstly, you are preventing that habitual posture releasing and following though, but secondly you are re-intending the entire pattern of experience that is associatively linked to that upright posture - in effect, fixing a large part of your world into that state. In other words, because the world is a single continuous pattern, holding onto or continually re-asserting one aspect can mean you are preventing the shifting of the state as a whole. Your habitual handling of even your body sensations can have an effect. This is why doing a daily releasing exercise is a good idea, I think: it lets your accumulated patterning unfold, but also it gets you used to the idea of allowing things to happen spontaneously and only occasionally re-directing things via intention. So your idea of initially experimenting with something that is an "easier" goal sounds like a good move. If it is less bound up with your core moment-to-moment experience, it is much easier to not interfere with the new state while just going about your daily life.

Additional thoughts:

Trying to really intensify a pattern could also trigger a problem in this area. If we have an idea that intensifying something requires "effort", we will tend to bring about the "feeling of doing" when we are intensifying it - but that "feeling of doing" actually has nothing to do with this process! However, that "doing" experience will perhaps trigger all sorts of stuff associated with your current state. The intention itself should feel like nothing. An intention has no sensory component of its own, after all - it only has the sensory aspect of the target pattern, since that's all an intention is. If the target pattern has a component that corresponds to the expanded senses in the current moment, then you will experience that component growing. (For instance, the intention "it is true now that I am getting very relaxed" will obviously produce a sensory experience right now.) If it is about some future event or a more generalised fact, though, then you might experience nothing other than an abstract "knowing that your are intending" - or maybe a shift in the background felt-sense of experience (since of course, the entire world forever is here, now). So, the intention "it is true now that I will next week's competition" will perhaps not generate any sensation in the current moment - although it might bringing a shift in the sense of a lightness and anticipation and confidence that wasn't there before, or similar. It is a challenge to not tinker with something since by definition you have no evidence for it in advance of it happening. Maybe simple doubt is at the root of a lot of this, the doubt that surrendering to "spontaneous unfolding" after our intention can lead to our desired outcome?

POST: Thoughts becoming actions

It's how things work anyway, and it applies to everything. I'm going to have a bash at expanding on that (just as an excuse to riff on the topic): Until now, you have been moving your body by trying to "grip the sensations" while intending the arm to move. This is like commanding yourself to stay still and move at the same time - i.e. asserting you current position at the same time as asserting a new position. Instead, while meditating, you imagined (asserted) just the movement while not asserting you current position to the same extent - therefore allowing experience to shift towards it. If you really ceased asserting your current position more completely, I suggest the movement would have been more immediate - simply bringing the movement to mind would have resulted in a shift towards that position.

The relationship between this and "jumping"?

Well, your body is as much the environment as anything else. There is no difference between the process of changing your body's position and change your world's position. In truth, you do not actually move your arm directly at all! What you do is you "assert the fact" of your arm being in the air, at which moment the facts-of-the-world are immediately updated (perhaps with a time component), after which your experiences arise constantly with that new fact. This is exactly the same thing that happens with updating any other fact.

The essence of this:

- THE FORMULA - Act + Intention + Detachment = Shift
- Any "act", mental or physical, means what you have decided that it means, knowingly or unknowingly. This is the "intention", a subtle thought pattern that is a shadow of the desired end-state. (The "act" can be a thought, a physical movement, anything.)
- Your experience unfolds in accordance with the sum of these "intentions". (Meanwhile, the less you are continually re-intending your current state, the more time-efficient the shift to the target state will be.)

So maybe we can categorise things a bit:

- Usual Movements - If you grip your arm mentally (with the implicit intention that this means your arm will move), then the gripping is the act, but unfortunately it also opposes the movement to some extent (as well as generating tension).
- Efficient Movements - If you imagine your arm moving (with the implicit intention that this means that your arm will move), then the imagining is the act. You are going straight for the end-state here, and letting your experience shift freely, so there's no conflict.
- World Movements - If you pour a glass of water (with the implicit intention that this means a fact of the world will change), or imagine a scene vividly (with the implicit intention), either will result in a shift. A result is guaranteed, however its level of contribution to your experience depends on detachment and your intentions so far.

This is where the phrase "The Act is The Fact" comes from, suggesting that all acts are arbitrary and their meanings are flexible:

- RULE 1A - Assigning a meaning to an act is what gives it causal power.

Note also that the assignment of meaning accumulates (that's why you live in an apparently stable world) and can be broadened beyond deliberate acts. You can play with things like "the next time I see a red car, it means-that I will have a great day". And what is an act, other than the experience of an act?

So the more generalised version of this is:

- RULE 1B - Assigning a meaning to an experience gives it causal power.

As a sidenote, I have tried the glasses trick twice, the first time earlier this month as a test, with 'single' and 'girlfriend' as the subject. I chose this mainly because it would be the easiest thing I thought to see a change in, not because I was desperate for a girlfriend. When I did it, I did actually feel a shift, although I haven't seen any overtly massive changes since. The second test, last week, was 'low attention span' and 'complete focus', I didn't feel a shift at the time, but last Tuesday night, I felt a complete shift away from heavily valuing inherently useless acts and suddenly became overtly motivated to improve myself, and since then have felt extremely liberated and with a sense of peace and calm. Maybe I meant 'complete focus' in a different way that I intended?

The "complete focus" one is interesting.

Related perhaps: often we tend to assume that being "focused" towards a goal means "concentrating" - i.e. narrowing our attention. But actually, such a narrowing of your attention just deforms your experience and builds stress, opposing movement and preventing change. It's like the thing of trying to stand up while holding onto being-sat-down. It's better, I think, to consider "focus" as *intentional focus", meaning that you have an intention and you don't interfere with it. There's no effort involved in this. So I'd consider "feeling liberated with a sense of peace and calm" to be very much a symptom of being focused in the intentional sense: wide-open attention, clarity, effortlessness, clear direction.

As to the mirror technique, I'm not a fan particularly. I'd be more inclined to do the equivalent of your meditation-arm-movement - get into a relaxed state and summon imagery which means-that your desired state will be activated into your experience. It's fun to play with all approaches though, and see what works best for you.

So, I'll start off by saying there is no "creative intelligence" other than you, and nothing ever "happens" other than the movement of your attention. For simplicity let's think of the world as a 3D landscape (a current overall pattern), and your unfolding experience is like your attention traversing that landscape, section by section.

Okay, so how is this landscape formed?

Pattern by pattern. Think of each intention as triggering a new pattern across the whole landscape, such that it is added to the current world, to form a resultant pattern which is novel (note: negative patterns can undo the contribution of positive ones). So we have something like this picture of Moire fringes. With that model in place, let's apply the following interpretation:

- Each pattern corresponds to a fact-of-the-world.
And let's have some facts, which were created implicitly through combinations of previous patterns leading to the current landscape:
- (General:) "SP is a good person who finds happiness from friendship. All those friends live in SP's city."
- (General:) "SP is an ambitious person who wants success."
- (General:) "Events tend to unfold such that SP will be happier overall."
- (Event:) "SP's company is diversifying globally and will open an new branch in Alaska in June 2016."
- (Event:) "Another company suited to SP's skills will open in SP's city in October 2016 with great opportunities for experienced talent."

All of these can be "subconscious" in the sense that they have not been experienced as expanded into the senses yet, but they are all true at this moment. But let's say you have previously explicitly thought about your ambition, but not the friendship aspect.

So how does this play out?

If you were completely non-attached and allowed experience to simply flow, then in June 2016 would hear about the Alaskan branch, circumstances would be such that you either didn't go for the promotion or didn't get it, you'd hear about the new company in October 2016, get a job there and be very successful and love life with all your friends. If instead you hear about the Alaskan branch in 2016 and try to push yourself towards that because you have already though about ambition, you will feel yourself intending in that direction against the momentum of the pattern, you may even encounter lots of "signs" about not doing it, nagging thoughts and feelings, events arising as hurdles, but you ignore it and push through. You spend the rest of your days in an icy landscape, the boss of the branch but all alone. In no case is there an "intelligence" operating behind the scenes. It's simply a case of a patterned landscape being set up with biases in certain directions, and you later intending against it and experiencing the results of that. It is equally possible to have a "subconscious" which is setup against you and leads you to self-destruction (although most people have a default "survival pattern" I would say).

Just to preamble:

Fundamentally Wrong, Relatively Right

In my limited understanding of your model...

We have to be a little careful here, because (of course) every model we use is a metaphor, not the actual situation. To think about something, we necessarily have to cut it into parts, and then relate those parts in space, because our thinking is basically a "shadow-sensory experience". In this discussion we are talking about the thing that even thoughts are made of, it is "before" division and relation, before "space" and "time". In other words:

- As soon as we talk about this-thing and that-thing interacting, we are already wrong in a fundamental sense, but we can be right in a relative sense.

This is why we tend to end up with a few metaphors, each of which might seem to slightly conflict in terms of how it chops things up, but capture a different slice of meaning, if that makes sense. They are judged on their usefulness, rather than their correctness.

Okay, with that out of the way:

One Thing, Many Patterns, Varying Contributions

you immediately get the thing (and a cascade of its related patterns) but the "landing site" on the landscape may be closer or further away from the spotlight.

That's a really nice way to put it, yes. Inevitably, I'll expand a bit on it...

Another way to think about things is: in the daytime sky, all the stars are there, at their usual brightness, however one star (the sun) dominates them with its intensity.

Either this is the ultimate AnswerToTheLifeTheUniverseAndEverything or some top-secret viral mind-screwing meme you're developing and weaponizing for MI5

Why not both? ;-)

Okay, so this is much harder to describe than to actually play with. The main purpose of the "patterning" model is to break free of the idea of the world being "really like" your sensory experience, in such a way that it makes sense that you can use your imagination to make change, and assign meaning to acts, and have results "as if" there was a world out there that was being updated by them. But really this is philosophy and metaphysics and you don't need to understand anything in order to use the conclusions, it just means you can answer questions about "why do this and not that?" and don't end up talking hand-waving new-age vagueness.

So, if I can control the dials of this cool Reality Mixing Console, what prevented me ("after" all this "eternity") from pumping up all the pleasurable patterns and turning down all the painful ones?

You've probably noticed already that pleasure is temporary, because experiential content is relative and changes. Pleasure and pain, I suggest, arise from how things are separated, the tension between one state and another when you resist the shifting of your world, not their content as such. The only way you can have eternal bliss is by dissolving all division, and therefore all content. But then, after a while, you probably have a thought and the whole thing kicks off again. (You can, however, feel contentment all the time, but that's a bit different.)

There's also that thing of: if you knew it was "all a dream", then you wouldn't mind so much what suffering happened in your adventures, because it would "all turn out alright in the end".

The classic "simple but not easy", to the extreme...

Well, it's "the thing", this, isn't it?

So, practically speaking, have you had the experience of being an "open aware space" yet? That's the first thing to go for. What we're after is to build the bridge between thinking-about and direct-knowing. After that, it becomes more obvious how things work. Right now, you are literally experiencing all possible patterns. All that changes is their level of contribution to your experience. The combination is what's giving you the form of this present moment. As some of the patterns fade, their contribution becomes less, and the total pattern apparently shifts into a new form. Like the Moire fringes I linked to above. The fading of one pattern is the equivalent to a pattern moving across another in Moire fringes - see here. A nice way to imagine this is as a stack of transparent projector slides, each with a different pattern. But rather than a light shining through, each slide has its own inherent glow; it is self-illuminating. You can turn up or down the intensity of the contribution of each pattern to the overall stack. Each slide corresponds to a particular formatting or "fact" and some of them can be quite abstract facts. For instance, one "fact" might be the pattern called "time". That activation of that pattern will then structure the the total experience as if there was a sequence. Another "fact" might be pattern called "distance". Another, "colour", and so on. This means:

- The "gloop" and your "experience" are actually the same thing - and that "dark zone" is present too, at all times, since it is just our name for the more prominent contributing patterns.

In normal life, we have what you might call a "passing time" pattern. This is a static pattern, but it has the effect of producing the movement and change effect that the video above showed. Since what we truly are is the stuff all this is made of - the infinite gloop is us - we can also intentionally shift the levels of contribution, and thereby pick out and adjust things we might call "the future" or "the past", and indeed adjust anything that might be called a "fact", either a general principle or a specific event. We can select a particular slide and modify the extent to which that is going to be a fact in our world, in effect swap one fact for another, and so on. So, I'm not sure how clear that was, but you can see that fundamentally there is no particular structure. And even given the total pattern (distribution of contributions) you are experiencing right now, there are many ways we can slice that up conceptually when we are thinking about it. This is why we can say that the world-pattern is both static and eternal and moving and temporary, and so on.

I perhaps should have written 'intentional complete focus', but I knew what I meant.

That's all that matters. This isn't a message to some external "entity god"; we're not making requests of Father Christmas. The words are just a way to capture the essence of the idea you have in mind, create a form for it temporarily so that you can work with it. There is nothing external to you, "doing" anything. This is a "dumb" process: the moment you perform the act is the moment the update happens - it's just that you encounter what you've done later, like an architect exploring a building they have designed, seeing the finished product for the first time.

In case it's useful, when I first started the "spontaneous movement" thing, in my mind I thought of the initial step as deciding to "cease" or "stop generating", such that I was in what I thought of as my current "rest state". From there, since I was not intending any particular state, I could just create an imaginary cause and have it move my body.

So, I'm not honestly sure if I anything shifted, and by saying/thinking that, it more than likely hasn't, but even the act of typing this out shows evidence to me and makes me more inclined to believe. Which I know is a paradox, but oh well.

Yeah, well, you might as well get used to that! :-)

I actually migrated to this subbreddit through the Oneirosophy one, so I'm well aware of the nature of paradoxes, I just didn't want to get too cocky and say something to pretend like I have any idea :P

Haha, "migrated", I like it! Well, you know roughly where I'm coming from then (although I don't always quite agree with the content there). So don't hold back on "pretending like you have any idea". ;-)

Just a thought: remember, for this particular stuff you don't need to "visually-visualise"; you can just "feel-visualise". This is easy because it's actually what you use to direct your body anyway, even though you might be also gripping and manipulating in other ways. (If you weren't doing this, by which I mean the "feel", you would never be able to change state in terms of body position.) For instance, expanding "the feeling of you" into the room around you, including your body space, is usually pretty fulfilling (excuse pun), and good practice for everything else.

It's quite fun and exciting, isn't it?

Something else to do. For everyday living, it's nice to be open and spacious, but expanding out can imply some level of maintenance and an edge. So, imagine for a moment that there is already a background space which is infinite in all directions and passes through everything in all directions, and that this is the "openness" in which all experiences arise. Any one point is instantly the whole thing, in a similar way to how, if you put a drop of special purple dye into a pool of water, the water would immediately be purple. "Purple" would be everywhere. That's what this unbounded space is: the context, everywhere. To be part of this space, is to instantly become the whole of this space.

Now, just decide to be that background space.

When you say summoning imagery that means the same thing as the two glasses trick, what exactly do you mean? How do I imbue 'visualisations' with any of the same intent? Do I go 'I'm visualising the aftermath of what I wish to happen?' will it so, and then leave it?

Not exactly sure on the question, but... I'm saying that any act - mental or physical - means what you decide that it means, or takes on the power implied by its extended pattern. So when visualising an end state while implicitly deciding that doing so means-that it will happen (the default for most people): the act of visualisation = the content is true. Or pouring water which implicitly means-that the situation is being shifted from one state to another: the act of pouring = the situation is updated.

So visualising something and knowing it to be true is all that is needed, I think I get it.

Yeah, that's the essence of it - your world is literally solidified imagination; to visualise something and imagine-that it has certain properties is to literally create a "soft" object with those properties.

You can always simply assert a fact, which is basically to increase the intensity of the abstract pattern that is that fact. But because that is direct and there's not necessarily a sensory component to that, it's: a) impossible to describe, b) has no technique associated with it. So it's easier to assign properties to intermediate objects or events. (The visualising of an image is, of course, an assertion of its existence, but because we are focused on the content of the image we tend not to worry too much about how it is coming into being. Answer: it just is.)

POST: Thoughts Become Actions II

how thoughts can directly affect reality

I'd add to this a little and say, they are part of reality. A thought is a literal tugging-on or activating-of that part of reality, so that it becomes more prominent in experience. Seeing that the difference between senses and thought is a matter of stability and intensity of content, rather than a difference of type, really helps I think. Related, then: definitely, if you have accepted some "facts" which correspond to you always being a lucky guy, "hey things always work out for me", then - even though those are more abstract notions - they tend to result in lucky-shaped experiences just as much as contemplating owls tends to bring about owl-shaped experiences. On top of that, there's the whole thing of not being able to die, in the sense that experiencing must always continue in some form.

It's funny, everyone hates when I say I'm lucky in that way, because they think it will jinx it. Now I know it will do the opposite!

Definitely embrace it. However...

The important thing is to match that with also allowing events and actions to arise without interference. Because if you go about the place saying "I'm lucky" but resist the "lucky movements" that are arising the world, you're just left with arrogance. This is where "pride before a fall" comes in. You can be confident, but the confidence is actually in the form of faith - faith and trust in the flow of the world within you. So it is not a personal confidence in ability in the sense that it's not something you do deliberately, moment to moment. There is no skill on your part: you get to "ask", but then you must do what you are told (in the sense of letting yourself be moved as part of the world) like a good and humble disciple, in order to "receive".

Q1: I should note that it's something I'll say maybe once every year, and then forget about it until the next time it arises in conversation, which is rare. So, I guess I've used it accidentally similarly to the last step in the two glasses, release it and forget it. It's not like I plan these life changing events :P. It's just something I have to be mindful of (or not) from now on. I've always had that inherent trust, I guess that's what optimism ultimately is.

I don't mean you'd plan the events, more that some people screw up these things by imposing their will on moment-to-moment experiences - opposing their own luck. Now that's unlucky! Yeah, it really is about being mindful as you say, as in understanding how the current state of the world is being revealed to you, and how your every intention updates this, without caring whether it's to the moral good, to the better experience, etc.

Inherent trust = optimism or ignorance, depending! :-) What you can trust that the world will naturally flow in alignment with its current state, which corresponds to the sum of your intentions. Unfortunately, that applies to good world-states and bad. You actually do have to become lucky in order to have lucky experiences. As you say though, the occasional unopposed assertion of luck pretty much does the trick.

I hadn't heard that, it sounds very interesting, and it should work as well. If you say something out loud, and attach intent to it, I would have thought that should be an especially strong way to shift reality.

Right, it's just triggering a pattern like anything else. The only problem with words is that they are not very specific, they have a larger "extended pattern". But if your intent is narrow - you are defining the exact meaning of the words as you use them, rather than simply giving power to the words - then that can be fun to play with as another "act + fact". I came across a blog post ages ago where someone was playing with saying "I command..." to get ad hoc results. I quite liked that idea, explicitly taking on the "God" role and just taking control of the situation.

POST: Jumped once. Haven't been able to jump since.

No matter how hard I try, I can't jump.

Isn't this perhaps the problem? Trying to make it happen?

Jumping involves detaching from your present surroundings and the situational patterns you are holding onto, to let them shift. If you are gripping them and trying to make them change, then you are preventing change. Decide your purpose. Lie down. Give up to gravity completely and absolutely. Let everything dissolve.

A little mind boggling to think about jumping to a dimension without a purpose therefore no true destination.

Yeah. Well, we call it "dimensional jumping" but it's more like you stay where you are and the world within your mind falls into alignment, maybe changing who else it apparently overlaps with. Even if you don't specifically think of wanting something, you do have background intentions that you are holding onto. (If you weren't holding on to them, they'd already have manifested.)

So if you don't have a destination, but let go, it's like the world will just resynchronise with all your current "held" intentions even if you're unaware of them. That's why I say you don't need to "try" and in fact "trying" will stop shifts happening. If you concentrate on something you want with effort, you are still "holding onto" that pattern in thought and not releasing it to sink down and get absorbed into your world.

So Korrin has the right idea:

- Optionally: If there's something specific you want, you can summon the feeling of that thing, deciding it is true, bringing it into mind. That pattern is held within you at that point; as are any other non-released patterns.

- Definitely: To have any changes occur, you have to completely and totally give up, detach from the experience around you and your feeling of the world. This releases patterns from being held in thought, to shifting into experience.

Hopefully that makes sense: it needs to be the opposite of trying. Letting go is what allows your world to shift. (Not just esoterically speaking; it's true of physical skills, solving intellectual problems, all that everyday stuff too. Letting go of an intention is what enables it to turn into an experience.)

we need to NOT have a purpose?

Not quite. And I'm going to emphasise "conscious purpose":

In order to get specific results that you have consciously decided upon, you must release them. Summon them fully, then release them. If you are content simply to have your world realign with your current "backlog" or your current "true will" then you can just do the releasing part. It's similar to magickal approaches like this, where you decide what's going to happen, and then don't interfere. If you lived every moment completely open and allowing, you wouldn't need to do the jumping process (letting go). However, that's pretty rare, so summoning the feeling-of-truth ("this <insert fact here> is true") and then releasing it is the next best thing.

What exactly do you mean by letting it go? You tell yourself something is true, then just stop thinking about it?

The general idea for a particular desire: You generate the feeling of something being a fact, really feel that it is true, and then release holding onto that feeling-thought, so that it takes effect, and go about your business as normal. It's like problem solving, where you think about the problem in detail intending to solve it, then leave it be, and later you find the problem-thought has evolved into the solution-thought. If you keep pondering the problem, you never let it turn into the solution. Doing a "jump" is basically an extreme version, where you are releasing your hold on your entire world, which increases the "available routes for manifestation", and lets the whole thing shift. Practically speaking, the more relaxed you are, the deeper you settle, the more like a wide-open space without obstructions you become, the better.

POST: Questions about Jumping & Jumpers (Serious & Respectful)

A1: When you jump, the other you enters the dimension you were in, because there was something the other you found better in the dimension you were in. My thoughts on escaping death are that your consciousness merges with one of yours from whatever dimension is most similar to the one you are in where you did escape, and if there isn't one similar enough, you will probably just die.

That truly answers my questions in that regard quite well. Thank you!

An alternative is to view it as shifting your attention.

If you imagine a grid containing all possible experiences, all possible moments you could have, the experience you're apparently having now is the one your attention is on. Meanwhile, your apparent life history is the trajectory, the sequence of moments, you follow across the grid. In daily life, just because your attention isn't on something doesn't mean it's not a part of you. As you focus on these words, you're probably unaware of your feet. But now you are aware of your feet. They didn't stop being part of you just because you were distracted. So if you think of "all the possibilities" as being you, then you are always all the variations of yourself - they amount to your extended "body" - it's just that you are only focusing on one part. Until you realise what's happening and make a change, or the trajectory you're on hits an experience which doesn't have a next-moment. Imagine if the screen went blank right now and these words disappeared. You would suddenly be "thrown out" of the experience of reading my comment, back into your body and the room around you. Having a near-miss experience is like that: You are in a car crash, there is no escape, there is therefore no naturally continuous "next moment" for you to experience after this - the screen goes blank, and you are thrown out of that experience, that part of you, and your attention has to shift to another part of you. So you experience a discontinuity, as you are shunted to the nearest available moment where the path continues.

That is a very concise and readily understandable explanation. My maze through Wikipedia from the initial Third Man reference ended on Jim B. Tucker and his, as well as his mentors/colleagues', work with children who remember "past lives". I have to say, his explanation, which expands on previous theories using quantum physics, as to how consciousness transfers from one body to another is the by far the best I read to date. That may not be saying much though, considering how little I've read on the topic.

Ah right, interesting. If you haven't already, you might want to sift through the two or three AskReddit creepiest things children have said threads. There are a few past-lives or similar curious things there. Also, a few people remembering "beginning" at a later age. Which makes sense, perhaps: it is not necessarily true that you-that-is-awareness was always looking through a "human moment".

POST: What is jumping?

A1: Essentially, it is switching places with yourself in a different dimension.

Yea i mean thats pretty much as simple as it gets.

That's a way to imagine it, but I'm not sure that's what it is though, right?

Most people do agree that is what it is. It isn't fully understood yet, so we may find out in the future that this is incorrect but as of now, that's the most accepted theory (that I have found anyway).

The difference is probably just in wording, to be honest, in what we mean by "me".

I tend to think of it more as a shifting of attention, so that I am now looking "through" this experience rather than that experience - which assumes the "me" is that-which-has-experiences, and the rest of it (the body and the environment, which are the things that shift) is what-I-am-experiencing. This view fits better if you accept the idea that our bodies and thoughts happen spontaneously; we don't need to constantly be "looking through" them and managing them.

POST: [Serious] Share your stories with me?

Q: Deleted

Everyone's in the other dimension now...

In which dimension? Should we start keeping track of the dimensions? You could number them, name the changes and then try jumping again... This way you could have proof for yourself, since no one in the new dimension would know any differently, since in theory, they have always been in that dimension.

Tricky to keep track, I suppose, since not everyone who does this will see themselves as "jumping dimensions", so much as altering their personal universe or shifting their personal attention. The identification might fall apart with that, since it isn't actually dimension-dependent reliably.

POST: Is this place for real or are all you guys full of shit?

A1: "...actively trying to perceive things differently..." An interesting and insightful comment. One of the quirks of human perception is that we do not process perception to a fine level of detail; instead we pick up enough points of reference to identify a pattern, then mentally fill in the rest of the pattern. This is often called "selective perception" and accounts for a number of things, such as not being able to proofread your own writing (your brain keeps you seeing what you know is there, because you wrote it, rather than what is there), odd blind spots in perception (as in this image that people read as "Paris in the spring"), and wonderful actual mental editing of contradictory perceptions like the McGurk effect. So perhaps actively trying to perceive things differently is a lot more of an interesting empirical investigation than it would initially seem. Personally, I do believe the effect is real, that under conditions we can control our reality changes, however I do not at this point accept the idea of dimensional jumping for a number of reasons.

Yes on perception: [http://www.reddit.com/r/Glitch_in_the_Matrix/comments/2kvdfc/darkroom_vision_chef_hats_dreams/]

Had never heard (or lip read) of McGurk - excellent. What are your number of reasons?

You are just begging to be bored to tears asking me that. Perhaps it would be more useful for me to say the number one reason is that I think there are better explanations for the effect.

***AI:** You are just begging to be bored to tears asking me that. Perhaps it would be more useful for me to say the number one reason is that I think there are better explanations for the effect. A lot of the posts here I tend to not take as serious evidence when they are easily explained by other mechanisms. For example I think a lot of the stories about things seeming different, things being different than people remember and many other accounts with a single observer do not offer any prima facie evidence for the existence of all these multiple dimensions. But there are many that intrigue me that seem to have no other rational possible explanation, aside from just plain old being made up. However having said that, there is a long tradition in many of the mystical schools, even ones associated with the mainstream religions (Yogic traditions in Hinduism, Sufi in Islam, Hermetic/gnosticism in Christianity and others) that reality is not objective. The idea here is that everything exists as potential, and it is brought into a specific form (reality) by conciousness. There are not infinitely many dimensions in which you exist but rather infinitely many potential dimensions existing in you. Many of these traditions talk about reality being a dream and we are the dreamers, and sometimes when you are aware you are dreaming, you can change the dream. Dimensional jumping might be considered then an editing of reality through intent. Now that is a really intriguing question to me even though I personally love the idea of infinite realities, I think it is more likely that there is one reality with an infinite number of manifestations. I once spoke to someone I knew who had seen someone essentially teleport, one minute they were on the phone miles away to this person, and the next this person literally appeared in front of them. (Not sure if it was as described but that is not the point). When asked "how did you do that?" the alleged teleporter said "You see the reasons why it is impossible, I see the reasons why it is possible. That makes all the difference."*

You are just begging to be bored to tears asking me that.

Not at all. This is my main area of investigation - not "jumping", but what you might call the "direct application of metaphor to create plausible routes for experiential change". Very interested in your ideas! My thoughts in response:

Single observers and dimensions

The single observer is always going to be a problem, because although that is what you would expect from the concept (if you jump alone, you'll be the only one to remember the "old ways"), it leaves nobody with evidence. Other stories (several in /r/Glitch_in_the_Matrix for instance) where two or more people share the experience, are more persuasive. Assuming again, of course, that they are sincere.

There are not infinitely many dimensions in which you exist but rather infinitely many potential dimensions existing in you.

This is more the model I'm inclined to adopt (an edited-down version of this here). If we consider ourself an "awareness" within which all possible moments are dissolved or enfolded, then "jumping" or any other sort of intentional change is simply a case of unfolding a particular moment. Since there is no solid underlying, then absolutely anything is possible - however...

Your mind becomes "formatted with habits" over time, which funnels and limits subsequent experiences. As I've said elsewhere:

1. Experiences leave traces which in-form subsequent experiences.
2. Thinking is an experience, and so has the same patterning effect.

It is this second part which allows us to create "plausible routes" by which novel change might occur (and also to dissolve restrictive patterns).

[Teleport] You see the reasons why it is impossible, I see the reasons why it is possible. That makes all the difference."

There's a book by Jeffrey Mishlove called The PK Man, where he describes spending time with one Ted Owens.

Ted Owens claimed to be in touch with 'other entities' - but that aside, the main thing was that by interacting with them he could (this is documented in the book but we must make our own minds up of course!) affect the weather, various other circumstances. Mishlove seems to be a fairly balanced reporter on this (he delayed publication so as not to ruin his serious career at the time, he was pretty non-trusting of Owens but got to know him). Anyway, he finishes with some other thoughts, one of which was about the Zulus. They had said that they'd tried to teach Westerners about their ability to directly change the weather, make it rain and so on. The most important thing, they said when asked, is that you have to believe it is possible.

In short, you have to know that there is a plausible route by which the event can occur. Your intentions are always responded to, I think, but given that most of us have fairly restrictive worldviews, the routes and results are fairly limited. (For instance, we often dream of the result rather than obtain in in waking life. At least in the first wave of response.)

...

ok how about this follow the instructions but think of the biggest jump you possibly can like a dimension where your the president and than tell us if ts fake or not

He won't be here to tell us.

The version of him that is no longer President will be though. And he will be convinced.

Jump to a dimension where you are The God Of All Dimensions, and give the heads-up to everyone.

POST: Jumping and Parallel Worlds

I realize that it is our minds that jump around from one dimension to another. Not us, but our minds.

I think of it as our minds (which are just open spaces of awareness) sort of connecting to different viewports, such that the experience of that particular "person" arises within us. (A little bit like this [POST: Why did the devs implement dreams?].)

Worlds are not spatially located, or in fact spatial at all. I like to think that the entire world(s) and all history are 'dissolved' into the background here, right now. Switching from one situation to another is simply a case of packing this moment away, and unfolding a moment somewhere else on The Grid Of Infinite Possibilities. Have you read Robert Monroe's Journeys Out of the Body? In it, he speaks of different "Locales". One of which, Locale III I think, has him finding himself in an alternate world, looking through the experience of a particular person. The world is like ours, except it runs more on very clever steam engine innovations, and there are other changes. Technology is fully realised, but different. He revisits this world/person multiple times at different point of his (the target's) life).

Ah, here's an excerpt:

Locale III... proved to be a physical-matter world almost identical to our own. The natural environment is the same. There are trees, houses, cities, people, artifacts, and all the appurtenances of a reasonably civilised society. There are homes, families, businesses, and people work for a living. There are roads on which vehicles travel. There are railroads and trains... However, more careful study showed that it can be neither the present nor the past of our physical-matter world
-- Out of Body Experiences: Journey to Other Worlds, Jim Dekorne

Do you mind - broadly, vaguely speaking - saying what sort of things you are going to try and fix? Have you taken account of the fact that your friends, etc, might also change during this process? Or are you going to go "full parallel", as it were?

Q: You are one of the first individuals I have seen relate this view here, and it is a viewpoint of the nature of reality (or at least a very similar view) that I have come upon independently as well (both through personal experience, logic, and reading). To answer OP, my view is that every time you imagine, you are in essence perceiving an alternate state of events (i.e. a reality). With mine and /u/TriumphantGeorge view of the nature of existence, the idea of a primary timeline is a little illogical. To extrapolate that further, the idea of a timeline is actually worth very little except in the storytelling sense. Every possible moment you experience connects because you perceive them to be related by cause and effect, the real relationship between any given moment at any point in the universe of probable moments is probability. I also dis-prefer to use the word "mind" and prefer to use "consciousness" when I refer to the experiencing entity (i.e. me) because, in essence, I believe that we are but a tendril of a larger collective.

I usually use the term "awareness" to indicate what we are, but it needs a bit of background explaining for context, so I do skip it. ("Consciousness" can be a confusing term, since there is consciousness, consciousness-of and self-consciousness, with different people arguing about different versions, claiming they have "explained" this or that.)

Yes, there is no fundamental timeline, there is only the trajectory that you have gone through (which may or may not be all in one world), in terms of sequence of moments - and the 'personal' memory associated with that. The "world timeline" is merely inferred by a lot of participants in a world (by which I mean, the collection of moments corresponding to viewports within a particular common area) having had a similar experience, and therefore similar personal memories. The important thing is - all possible moments are available, and there is not necessarily a restriction that says they must be continuous (e.g. in principle, you could teleport or time-jump or world-jump, without an intermediary stage). The question then is - what is it that dictates which moment is next, and our overall trajectories? We do not seem to actively choose moment by moment, so what dictates the path and how can it be modified?

*Q: Indeed, that would be the million dollar question wouldn't it :)?

My current framework supposes that the moment to moment jumps are determined mostly by internalized beliefs, intent, and desire - with the magnitude of effect decreasing in that order. For example, if one did not believe that "long range" jumps were possible, then it would be unlikely for such a jump to happen from any given moment to moment, meaning that the probabilities that determine the likelihood that any given moment follows the present moment are determined primarily by the beliefs one has about how things would likely proceed. This extends beyond beliefs in natural laws, for example, as beliefs about one's personal predilections have probabilistic effects on outcomes. This works even on a practical level as one's beliefs about oneself and the nature of the situation affect one's responses to that situation (therefore affecting outcome). Intent and desires factor in less in determining the probability of a particular moment following another. A good example would be that most people would love to win the lottery, and some even focus their intent to shift to probable worlds in which this is the case. However, given the internalized beliefs that many hold that such an occurrence is unlikely (due to a "rational" measure of the probability that any single ticket would win), the internalized belief wins out on the effect of the probability of jumping to an event where one wins. Furthermore, beliefs such as that are hard to undo as they are buttressed by a myriad of internalized beliefs regarding how the world should "work."

The only reason, members of this sub are able to jump to seemingly incongruous moments is because we are able to shed enough internalized beliefs to allow it. The question I might propose is if there is even a level of agency to all of this, even when we "jump" ...*

Not agency as such. More that we are changed, and the world flows in line with our new understanding/expectations. Working on ourselves, we change the world, because they are the same.

In fact, "world = random raw creative noise + habitual channels". In other words, the structure of mind is a filter that shapes infinity into a stable world.

...the idea that jumping entails some concept of switching places ...

I think it comes from a misunderstanding of what "we" are. People are imagining themselves to be a "person" that physically goes somewhere, and that there are other "thems".

...growing consensus here that jumping operates akin to the show Sliders...

Sliders at the moment, Parallels tomorrow. The problem is that fiction tends to imply a 3rd-person view, and people tend to imagine their own events in the 3rd person. We would be better off reading something like Replay or Philip K Dick's Flow My Tears the Policeman Said and The Electric Ant for a model, and fostering the sense of 'through-your-own-eyes' that such fiction can bring.

POST: Personal experience, long time ago.

we are unchangeable awareness...

Very nicely put. And we are not in anything (e.g. a body), rather experiences arise within us. The way in which we jump dimensions is that we jump experiences.

And got me thinking...

In an OBE we can end up temporarily 'jumping' to someone other than us, in a different world (see Robert Monroe's Journeys Out of the Body and his description of 'Locale III' - mentioned before but it's a nice illustration); a so-called 'Dimensional Jump' is really a jump to someone else who has a resemblance to our previously-inhabited perspective. Or one could say that really happens is that we disconnect from this dream and connect to (or create?) an alternative. The similarities between the two are based on expectation and habit and "holding on", perhaps?

So - in an OBE situation, we deliberately let go (almost) completely to the 'dream' we are having is free to reform completely. We don't completely jump there forever, though, because we keep a bit of "holding on" to the original world.

Aside: This holding-on is metaphorically represented in tradition by the notion of the 'silver cord', which keeps a connection between this body and displaced body. Really though, it is a visual representation of an idea, and lots of people don't actually experience this. "Cutting the cord means death", it is said. Which is true, in the sense of no longer being attached to this dream, and snapping-to whatever dream experience you've tuned into instead.

POST: I consciously jumped.. and it sucks.

Firstly, it's important to realise that so-called 'jumping' is not causal. As in, jumping doesn't make things happen, so if something is different it isn't your "fault". You should read an old explanation I've used based on the Infinite Grid Of All Possible Moments. Highlights:

Imagine a vast grid extending in all directions... Imagine that each square in the grid is a particular experience, a particular static moment, as seen through the eyes of a particular person... [...some details omitted...] In this model: From a 1st person perspective 'what you are' is a consciousness that is looking through the "viewport" of a certain square on the grid. There is no solidity to the experience, it is a dream-like experience. Everyone is having the experience of looking through a certain "viewport" at a certain time. From a 3rd person perspective, everyone is essentially an "extended person", since they appear as characters the experiences of many moments. In other words, when you make a 'jump' what you are doing is subjectively 'tuning into' a new grid position. There is no physical jump involved. You do not so much change solid reality as have a discontinuity in your experience. It is possible that only you will remember how things were previously, although at other times you may elect to bring another character through the change with you.

So your sister and baby have many aspects, they are "extended persons". Unfortunately, the path you are on involves experiencing those less pleasant aspects. But it is important to realise they are "experiences for you" and not for them.

I thought I did everything correctly and really concentrated on a BETTER version of my life, although my life was pretty good to begin with.

You have to be careful because it probably doesn't work quite as you think (literally). Now, how exactly did you approach this, both physically and mentally? (I have an idea of where things went astray, but I don't want to speak the magic word in case I influence what you're going to say.)

You can't return to the previous 'universe' because this isn't really about universes, it's about experiential paths, and discontinuities between moments (which is what 'jumping' is about) are limited somewhat by your beliefs. Your habitual inferences about people, worlds, bodies, universes are all without 'solid substrate'. Theoretically, it is possible to have a discontinuity which appears like time-travel, for instance, but could you ever really persuade yourself that tonight you'll go to bed in 2015, and tomorrow you'll have up in 2013 - Live. Die. Repeat? It's much easier to have the world 'shift' more subtly.

EDIT: As an aside, I thoroughly recommend that everyone read and watch as much fictional virtual reality, time-travel, and other reality-is-not-what-you-think-it-is material as possible, to give you some "mind formatting" which is more open to unusual routes of change.

POST: [THEORY] According to quantum mechanics, we're jumping all the time without even trying.

[POST]

The Many Worlds Interpretation [https://en.wikipedia.org/wiki/Many-worlds_interpretation] of quantum mechanics posits that for every situation in which there are multiple probable outcomes, every outcome does happen simultaneously, each within their own parallel universe.

For instance, you wake up one morning and open your sock drawer to find you have two pairs of socks -- one white pair, and one black pair.

When you decide which socks you want to put on, you are only deciding which outcome you would like to experience. But there are simultaneous versions of you putting on all the other possible combinations.

You choose to put on white socks. An alternate you puts on black socks. Another alternate decides on no socks. Another alternate decides to mix it up with a white on the left foot and a black on the right food. Another alternate puts a white on the right food and a black on the left foot. Another decides its cold out and wears white socks over top of the black socks. Another decides to put black socks over top of the white socks.

NOW: Every single day every person is confronted with countless situations in which they can have an effect on the outcome. So our universe is splitting into parallel universes far more times than you can ever count.

Within the multiverse, there exists every possible version of you, some better, some worse.

So, if it is possible to jump to an alternate universe, into an alternate version of yourself, you might run into some problems.

Suppose you grew up poor, and you jump into a version of yourself who grew up rich, you would have a serious problem. Your family will have gone on vacations that you don't recall. They would have gotten you gifts that you don't remember. Sources of stress and tension in your lives would be based entirely on other things. In essence, they will not know you and you will not know them. From their perspective, you must be suffering from a stroke or something.

And what happened to the alternate you who's place you've taken over? Did they simply jump over to your dimension? Or do all of your alternate selves all shift position? If it's the latter, you cannot jump universes without seriously screwing over all of your alternate selves.

[END OF POST]

There is no universe in which I choose the white socks. ;-)

A1: Look at the post by /u/triumphantgeorge
There is no entity to switch with. You are just switching perception.

I don't know if I agree. Each alternate you in each parallel universe has their own first-person experience of their own world. Suppose Person A from Universe A does the mirror trick and finds themselves in Universe B. Universe B existed just as long as Universe A existed, and during most of that time, an alternate you known as Person B existed within Universe B. So what happened to Person B when Person A decided to jump over to Universe B? If you're only "switching perception" as you put it, does that mean that Person A's body is lying lifeless while they mentally inhabit Person B's body, meanwhile Person B is not even aware that they're being piloted by Person A? I don't believe that there was no Person B, because if you jumped to a universe where there was no Person B, you'd have no one to switch perspectives with.

I think you are making the mistake of assuming that there are lots of time tracks actively "running" in parallel, and that there are people inside the time tracks, having experiences or piloting bodies. This is not the case: you are not a person in that sense. The trick to realising this is that from a higher level view: there is no time, and all moments from all perspectives are present simultaneously and in parallel. You are more like an "awareness" that "tunes into" a particular experience, moment, trajectory.

I understand that from an objective standpoint, time is a block and that our linear experience of it is only a trick of perspective. But I fail to see how this negates the existence of parallel versions of people in parallel universes.

It negates it in the sense that there are no physical universes that are "running" to worry about because there is no passage of time or timeline independent of an experiencer. And there aren't any people (in the sense we think of it usually), there are only perspectives and experiences. The benefit here is that we don't need to worry about bodies not being occupied and falling down, or a body already being occupied when we try to jump. We don't even need to worry about multiple perspectives experiencing a single moment simultaneously, if we start going to that level. In short, multiverses are another "you can experience it as-if" situation. It's an artificial restriction applied to a setup that has no fundamental restriction. (This isn't to say that it's not a useful concept, one that can't generate ideas for desires, but it isn't "real" in the sense of limitation.)

EDIT: To emphasise: there is no such thing as a spatially-extended universe outwith experience, and all moments of body-world-type experiences are "already" available.

In short, multiverses are another "you can experience it as-if" situation.

That is completely contrary to everything about multiverse theory. All other parallel universes ARE really occurring simultaneously. There is another you having their own subjective experience in another universe that you do not have direct access to. There are many other yous currently experiencing other things in other places, concurrently. The you that is here now is not the only one who is self aware and real.

They are not "occurring", all moments have already occurred in effect, in terms of a static pattern of potential experience. This matters. It also matters what is meant by a "you currently experiencing", because you have to be clear what is meant by a "you". We also have to be clear what is meant by a "universe" and where those reside.

Because fundamentally, it's all non-temporal and non-spatial. I use the phrase "as if" because the mechanics of shifting experience don't require you invoke an actual multiverse-based process, however you can use the model as a map for your intention.. It's a descriptive scheme.

EDIT: Trimmed the rest. Not currently relevant. Replaced with:

It is better to think of you as experiencing all possible moments right now, however only one particular moment is "unpacked" into the senses. You might think of yourself as an "Extended Person" in this picture. Remember, though, that since the overall picture is atemporal it doesn't matter "when" you do this.

Remember that in physics the Many Worlds Theory is really just an interpretative, unfalsifiable dodge to avoid having to deal with a non-deterministic, probabilistic picture of the universe given to us by the mathematics of quantum mechanics - treating possible paths as "really happening somewhere, physically" rather than as structural patterns describing (say) possible experiences that maybe could be accessed.

POST: Does "jumping" mean swapping souls? My thoughts lately on the idea of jumping. Feedback appreciated.

Your soul is trading realities (and bodies) with another you

I'm going to say... no.

It's more a case of shifting your perspective to another experience. You are simultaneously everywhere (all possible moments), it's just that you are focussed on a particular moment or trajectory across moments. This works because although we think of ourselves as 'inside a body looking out', our actual experience is one of 'being a conscious space' and having thoughts, body sensations and an environment arising within that. A bit like connecting to a particular instance of a video game or shifting your attention

across a grid of all moments. In your terms, it would be like your one 'soul' is actually spread across all possible experiences - all experiences are 'dissolved' within it - but it is 'concentrated' on one particular possibility at a time, bringing it into the senses. Everyday Example: Focus your attention on the sensations of one hand. Now focus on the other. When you shift your attention from one hand to another - attend to one and not the other - you don't have to "swap souls" with your hands in order to do this. You are always both hands (and indeed, your whole body), it's just that you are only bringing one hand into sensory experience at a time.

Thanks for your response, but how would this explain the story of the guy who jumped to mars? His other self was put into this reality, without any memories from this reality. Meanwhile, he shifted to the mars one reality. That story especially makes it seem like you are switching bodies/realities with another you, and when you do, you carry your memories over but you don't "take in" the memories from the body you've jumped into. Does that make sense? Shit, none of this makes sense.

The guy who "went to Mars" - remember there are no bodies. There are just experiences which contain body sensations. The memories you have are those you accumulate on the path you have taken, across the sequence of moments you have experienced - from your own perspective. Because the body-feeling is so immersive, it can be better to imagine this as people sitting watching a big TV screen really close up. So if you jump discontinuously, it's the scene on the TV show that changes. Everyone has a similar setup. People confuse 'what they are' with the history of the TV images - and most people have been experiencing the same body-perspective ("looking through the same eyes") consistently and continuously since birth, except for dreaming. So, people mistakenly come to believe they are a body rather than simply having a VR-like body experience. Metaphor: You are watching TV via a cable service called Life+, where everything is shown from the 1st person perspective to help you feel like you are a character in the show. Suddenly you realise you can "vote" on what's going to happen next in the script, and not just your own character's actions. Pretty exciting. Then you realise you can actually change the channel completely, switch to any scenario. Incredible!

Interesting. What makes you so sure about this?

Research and experimentation. Do remember that the descriptions are all metaphors to provide a useful way of thinking about something that is actually inconceivable/infinite potential. A framework for conceptualising intentions, you might say. You can relatively easily experience that you are an "aware space" in which a sensory world arises, rather than a body inside a world, via investigation. (Check out Rupert Spira's Presence Vol I & II for a good take on this, or Douglas Harding and his experiments.) The trick is to directly understand that your experience is constructed from concepts and that those are filters rather than building blocks. This leads you to a view of reality that is "dreamlike but with stable habits". The next step is to play with making changes. At root, all approaches are about softening your hold on accumulated perceptual habits, so allowing your intentions to become experiences in a more efficient way than usual. 'Dimensional Jumping' is one such way, a model which is pretty flexible. Meanwhile, /r/Glitch_in_the_Matrix is stuffed with stories of accidental outcomes, where people 'let go of stability' and their experience shifts from under them. The overall scheme might be viewed as:

Infinity, divided into moments, filtered through beliefs, expectations, knowledge & intention => experiences

And the 'method': *Soften or detach from the filters, adopt a worldview, such that you get to a "moment" that contains your intention (desired experience) by the most direct trajectory possible. (The ultimate being a straight jump to that moment.)*

EDIT: Just reading another blog and encountered this post [<http://buddhaspace.blogspot.com/2015/03/shunryu-suzuki-on-zazen.html>], which has a similar flavour.

POST: When you jump dimensions, other versions of you are probably doing the same...

I just realized this, in a multiverse where every possibility is a dimension, if you were to attempt to traverse to another dimension, you wouldn't be the only you to do so. There could be a myriad of other "you"s who also are trying to get to a more positive dimension after figuring out how to dimension jump. Whenever you dimension jump, its not just you switching places with one other dimension, its possibly millions of your dimensional dopplegangars simultaneously taking the same leap and being haphazardly reshuffled.

There is only one "soul" or consciousness, simultaneously being all perspectives, it's just a matter of which one you are paying attention to / unfolding into sensory awareness. It's all part of the Infinite Grid Service Agreement.

POST: Wondering whether it is feasible to travel dimensions to another biological sex

I love the name! :-)

The basic answer: Nobody knows until they've done it. And I sincerely doubt whether anyone who did would talk about it. There's also the whole issue of experiential overlap. In principle you can dream anything though. Every moment is a re-start, every morning a resurrection from nowhere - just with added memories to add to the convincing effect of continuity. Not quite related, but thinking about this brought something to mind: Back in the time of New Thought advocate Neville Goddard, being non-white was a serious problem for getting anywhere in life. Although he didn't advocate some form of extreme jumping, he did teach that that application of the imagination could transform a person's situation:

“You can start now from scratch and choose the being you want to be. You aren’t going to change the pigment of your skin but you will find your accent or the pigment of skin or your so-called racial background will not be a hindrance, for if a man is ever hindered it can only be the state of consciousness in which he abides that hinders him. Man is freed or constrained by reason of the state of mind in which he persists.” – Neville Goddard

In other words, shift to an experience where being black, trans, maybe even ginger* just wasn't a problem. Some might say we have already jumped to a world where that is increasingly becoming the case, with rather unlikely speed. Who knows where this trajectory is heading - and that's without doing anything too much in terms of radical intervention. I am Scottish-linked so I am allowed to make the ginger joke.

POST: Im confused about the whole idea of DJ.

[POST]

So, I dont completely understand the concept of this. Could you DJ and magically have 100\$?
Could you magically jump and have your crush be obsessed with you?
Could you even jump to somehow learn something? (You dont know how to play a guitar, you jump, now your good at playing guitar)
I understand that most or all of those intentions are a little selfish and immature. But I was just using them as examples.

[END OF POST]

These are all valid questions. I have yet to see that dimensional jumping can result in any kind of tangible difference such as having your anchor number change, let alone anything else.

Yes, they are. The problem is... it's not objective. But neither is it subjective. It can never be scientific, because there is no outside frame of reference. Everyone has to play the game for themselves.

Exactly. Perhaps there are infinite versions of your body that you can switch your consciousness to. Perhaps there is only one reality based on shared realities between you and others, in which yours can influence everything within small steps and vice versa. Perhaps neither of these options are true, yet they may be. The point is one is not able to proof without trying it.

I think that... it's all true, whichever way. It seems to be shared and consensus, but then some changes are only remembered by you, and you have power over others, but also they are independent, and so on.

Basically, it's just not conceivable. It's not a case of higher dimensionality, it's a case of infinite dimensions and therefore no dimensions. It feels like we travel a timeline, but there is no time aside from that experience. We can attach to any number of perspectives, which means there are no perspectives.

In the end we must simply say: Whatever we adopt that works, is something that works. Something is "true" if you commit to it and the corresponding experience follows. Tomorrow you might commit to a different outlook, and then that will be true instead.

POST: could i have jumped by accident?

Think of it as you moving from moment to moment. If time is to pass at all, you must shift to a next-moment. So "jumping" is not optional! Which means your trajectory will constantly adjust according to your beliefs, expectations, knowledge and intentions. It's about doing so knowingly and to great effect due to acceptance of discontinuities.

...

Not necessarily true, as I understood jumping unintentional shifts two realities that are very close to similar to one. Otherwise if you jump intentional you are able to jump to more different realities.

"Plausible deniability" tends to apply. What answer does OP truly want to hear? Etc.

I'm just saying that the idea of conceptionist might not work if it would've been a small jump. As well as it could've been no jump at all and his dad just changed his mind, his phone updated automatically and changed settings, etc. These changes might have been occured over a long time span and now because he read about "DimensionalJumping" his conscious is trying desperate to find changes that took place but he was never aware of.

Oh, agreed. That's what I meant: no difference between jumping and non-; he's maybe just looking for stuff. After all, every moment involves a jump to the next moment, doesn't mean the whole world has to shift for every small development.

POST: [Unknown Post Deleted by User]

*A1: there is no other you.

Lets do a thought experiment. Basic theory is that for every possible choice, there is a "dimension" that reflects the outcome of that choice. Now how do we know that this is the more likely scenario rather than a paradigm in which choices not taken do not exist. Well there are plenty of tales in which others here have been able to jump to the past. This is only possible in a paradigm where time is a consequence of experience ... i.e. it only exists as a result of requiring it as a measure of experiences experienced. Still that requires some suspension of disbelief from the colloquial view of reality - so just except that for the moment. In this paradigm, it is essentially not-preferable for non-choices to exist, since that would require all choices to be pre-ordained. In which case, Dimensional Jumping would be impossible since the probable reality in which you inhabit is the only one. Now assume that all possible choices exist, is it reasonable to assume that at every possible moment another soul or entity or version of you is created?

Assuming that every choice, no matter how minute creates a new probable reality, it is rather silly to imagine these realities as separate universes, since their quantifiability only extends to a sliver of a moment. At every possible moment, you are making decisions which generate numerous probable moments - at that rate of probable universe generation is it still reasonable to consider them separate universes if the extent of its uniqueness extends to mere microseconds, since at every second it is splitting into an infinite array of probable outcome "universes."

Because of this, some of us propose that the paradigm is essentially this: all possible outcomes exist all at once as points in a field. The experience of time is generated by travelling across this field in a probabilistic manner. Existence is the experience of moving through the probability field. Thus, when you jump, you are essentially just jumping to a less probable moment as opposed to more probable moments. There isn't another you to switch with, you are essentially just switching your perspective to a set of probable moments from which it less probable that you jump from your most recently experienced probable moments.

...

Excellent summary. William Blake describes the "Sculptures of Los's Halls", eternal pre-made states describing human drama in its entirety - dormant possibilities assuming reality when we become them:

All things acted on Earth are seen in the bright Sculptures of Los's Halls, & every Age renews its powers from these Works, With every pathetic story possible to happen from Hate or Wayward Love, & every sorrow & distress is carved here, Every Affinity of Parents, Marriages & Friendships are here In all their various combinations wrought with wondrous Art, All that can happen to Man in his pilgrimage of seventy years.

So we might refer to universes in the sense of "fully-defined moments of experience", perhaps, but not in the sense of spatially-extended physical environments. Similarly, no multiple souls, because there is only one mind which takes on the shape of an experience - and that is you. We shift our attentional focus across the Infinite Grid of All Possible Moments, in order to seem to be "here" or "there", but we are already everywhere really.

POST: Question about DJ-- How much can change?

Undirected 'jumping' is basically a leap into unharnessed change, detaching and allowing things to shift into alignment with your current state, and you'll get pretty much whatever you're feeling at the time, although it'll always be quite continuous. "No disintegrations!" So be more precise about what changes you want. Maybe check out the the Neville Goddard link I posted the other day for a different take on how to specify things.

POST: A hypothetical question

Let's also say that I like her very much and want her to be nearby without her having to physically move.

So, you just want to wake up tomorrow to discover she's now living in the same city, without experiencing a transition? The fact you are asking the question means you don't think such disruptive 'discontinuities' are possible or really desirable, I'd say.

Do I hold up a picture of my friend and let the metaphysics do the rest?

That is a brilliant phrase and I'm going to steal it. Hope you don't mind. :-) Meanwhile, why not read the Neville Goddard books and see how you get along with those.

Q: *So, you just want to wake up tomorrow to discover she's now living in the same city, without experiencing a transition? The fact you are asking the question means you don't think such disruptive 'discontinuities' are possible or really desirable, I'd say.*
What do you mean by that? I expect a transition of some sort to happen when I make the "jump", so I know that I switched dimensions or whatever. And what do you mean by "disruptive discontinuities"?

If you woke up tomorrow, to discover your friend lived in your city. And had always lived there. And that you've been supposedly meeting up every week for drinks for the past months. But you don't remember any of that. And your eyes are now a different colour. Would that be good?

Or would you rather your friend called you this weekend and said: "Guess what, I'm moving to <name of your city>!!"

I like the first option alot actually! Only question I have is about the method. Do I just visualize that when I'm in front of the mirror? Do I state my intentions vocally? Or will everything just work itself out?

Just know it. And open to it. And report back. So, not really a hypothetical question then. ;-)

Yea, I guess not hypothetical. :P Thanks for all the help, really appreciate it.

No worries! :-)

But, be careful with things yeah. You're basically reformatting your mind to change what experiences you "allow through the filter". Always take a pause to think about how you will really feel if things happen, with this or any other "esoteric" approaches. Unknowingly, you've spent your whole life gradually accumulating a "reality" and being comfortable with each step along the way, and this stuff just suddenly kicks things out of kilter.

POST: is this really real?

It's not exactly big among the reddit community. It's a subreddit with only 1500 subscribers. As for the mirror ritual seeming childish, I agree 100%. I just read this out of curiosity. I like to think about parallel universes, and so far everything in this subreddit sounds like its written by someone with a very tenuous gasp on the subject.

Yeah, I think it would be a mistake to think of this as parallel universes in some pseudo-many-worlds way. It seems like you have shifted to a different "realm" though.

Anyone who has done any experimentation with perception, magickal ritual, philosophical idealism and the like can see it's more about creating change in the patterns of your mind - with corresponding effects in subsequent daily experience. It is a shift in the subjective content a person encounters, which can be quite dramatic. It certainly isn't scientific. There actually isn't a "way that it works" other than the simple doing of it, with intention. This is why it doesn't make much sense to hold it to a scientific model. Science is "inside" personal experience. It's like coming up with a science of hypnosis, say. Good luck with that. The mirror approach must be one of the least controllable ways to force a loosening of the mind from its habits though - not recommended. It's like "three kings" while exposing your formatting completely to whatever your current mood is.

The clue is, I think, to understand that time & space are an illusion, so when you jump somewhere, it's not like you jumping INTO the world that was already there, but you sort of CREATE this world around you. Past doesn't really exist, does it, so the only changes you observe (even if they SEEM to be past changes) are only happening right now, and require no time at all.

I think we can let ourselves have it all ways. Our experience behaves "as if" there is a persistent past and future, and a persistent world beyond our perceptual, sensory space. So long as we recognise this "universe beyond our peripheral vision" exists as a set of revisable facts rather than a real spatially-extended world, then we can keep our heads together while also living a flexible existence. We might call this creation-by-implication. Wherever we look, a just-in-time spontaneous experience arises in our sensory space that is consistent with the facts we have accepted. We can never see "behind" this. It's almost claustrophobic in that way; suffocating in dream-stuff! But all that matters anyway is that we can change the facts - by detaching and asserting-allowing new ones - and that this changes the sensory experience. And having some sort of stable worldview (e.g. that there is a past and future, but we can edit it, or that there are facts-of-the-world, but we can shift to a new set) gives us something to work with.

POST: [post deleted by user]

Alternative metaphor: **Moments as memories**. In this view, **all possible experiences are "pre-made" as if they have already happened**. So what we are doing is navigating a Memory Block, and our ongoing is experience is one of recall. How do you remember something? You usually get hold of a part of the memory, and the rest of it auto-completes into awareness. However, trying to remember doesn't work - you have to "allow" it. And attempting to remember two things at once, or hold onto one memory while requesting another, rarely succeeds either, especially if they are opposites (remembering both red and blue, or good and bad, simultaneously). The sense of smell is particularly good for triggering memories, as is the emotion or global feel of a situation (which are sensory experiences just like any other, no different to vision or sound, just harder to describe in language). Which suggests that identifying the "feel of something being true" and bringing it to mind is a powerful way to trigger a memory into experience. When you "jump" what you are doing is letting go of this memory, and recalling a more desirable one. The more of the partial memory you bring into awareness during the process, the more constrained the result will be as it "auto-completes" via association.

What makes the entire set of "possible" experiences?

They are not made, they are effectively already given. It's easiest just to accept this, because it appears a little chicken and egg, but the reason is one of patterning. If moving to a moment is an act of remembering, and remembering is the activation of associated overlapping patterns, then anything you can conceive of exists but it's just not currently in the senses (although the moment you conceive of it, it is).

Is everything possible?

Potentially, yes. Anything you can conceive of, by definition. It's just a case of entering it. Practically, your own formatting restricts this. To discontinuously "jump" to another moment, you have to completely let go of this one. If you even maintain an emotional attachment, that maintains the pattern because it is a part of the memory like anything else. For instance, can you imagine lying down on your bed, entering a lucid dream, creating-by-implication a persistent realm, and just never waking up? Taking on the view that you don't "sleep and then enter while being asleep", rather you detach from one experience and attach to another?

So, it is still possible to jump without completely letting go right?

Right, just as you say - but the patterns you remain attached to can't shift. In approaches like the mirror technique, we are loosening our grip just a little with an intention for change, and if we are in a good mood then the slight realignment bring about a few beneficial changes - "auto-completed" from the good emotion. To more completely let go means to let go of the world. Even when we go to sleep and dream we don't do that (mainly because we implicitly intend to return to the world next morning, unchanged). The "decision" you've made on what's going to happen is probably the most important factor, next to letting go or "allowing change".

Woah. But then what are we doing right now?

You're probably not doing much of anything. You are "attentionally gripping" the patterns of your experience, and everything's staying pretty much as it always has been, keeping us on a "trajectory" of similar moments.

We can now successfully manipulate all the 4 dimensions...

Better to view it from your own perspective. All that every changes is that you switch to a different experience, like changing path a little to a slightly different dream. The world isn't to be seen as a solid place that gets literally manipulated.

Just had a random thought, if we experience our own death... and move to that experience...then what?

Do you mean, what happens if you die? One way to look at it: Well, in this view you never really die. Say you have a massive car crash, which means there is no obvious next-moment to experience. Perhaps there's a 'blip' and it kinda somehow didn't happen after all, and your life continues (several /r/Glitch_in_the_Matrix stories like that). Perhaps you experience leaving your body and floating about and going to another place. Perhaps you experience just suddenly waking up in bed, confused. Perhaps you lose all memories and experience being born again. Your background idea of what's "meant" to happen might well influence this. Experience of some sort will continue, because you are not a body in the world - you are "consciousness" having a being-a-body-in-a-world dream. But that's what you might call kinda Extreme Jumping!

...

RrWell, coming up with useful ways of looking at things (what I call "active metaphors") is my thing at the moment. My own experiences are nothing too dramatic and not really "jumping" as described here, just very very unlikely, and appropriate. :-) One of the reasons for participating is to encourage a move away from the blind, uncontrolled changes that that approach can bring. This actually isn't something to just mess around with to "see if it works". Because it will work, in some way, and the less structured your concepts of it the more it will just align things with your mood - which might be unfortunate.

(Most people don't really want a life of non-stop /r/Glitch_in_the_Matrix stories, right?)

But its surprising that you, having a plethora of knowledge in the subject, haven't really manipulated things the way you want.

Funnily enough, I suppose the knowledge (formulating the description) follows the experimentation: "Things are going well, what am I doing that's right?" When you get things running well, and "stay clean", you don't need to intervene so much. But you have to know what you were doing before, in order to know how to not-intervene :-)

I'd been using the 'Imagination Room + Infinite Grid' in daily life for a while, along with whatever fun metaphor seemed right for the upcoming day - and any metaphor will do it - but the more "meta" of how it works (memory-like auto-completion of patterns) is fairly recent. Unless a model takes account of generalised synchronicity, it has no durability.

...that's why you are still here

Only as an appearance in your experience! ;-)

When I get a chance I'll do some proper posting with a ground-up description and examples for here and /r/Oneirosophy. Reddit-wise, everything is scattered across multiple comments and discussions...

someone told me that they were just like me and wanted to jump far, but they ended up in the ER.

Yeah - they didn't realise that "jumping" doesn't mean physical jumping. ;-)

POST: What happens to the other-dimensional you you switch places with?

AND you don't need to get into the details for it to work.

This is a very good point. As a fan of metaphor myself, it's great to have a picture in your mind of a supposed mechanism or structure to back up our efforts. But the truth is:

However you imagine that it works, That's how it works. - TG

There is no inherent background to reality; whatever you want will unfold in some way if you let it. The basic formulation is that you completely and absolutely let go of the world and yourself and concepts you are holding onto, and then "just decide" what you want. However, most people need some sort of metaphor to hang onto as a "permission belief". In that case, it's about coming up with the most flexible one that you can accept.

Yes, but accepting this is much easier said than done.

Oh, I wasn't disagreeing. I was agreeing with your point that the details don't matter and it's best to just go with it. I was adding that, as we know, there's a good reason why it's okay to ignore the mechanical details. It's all about finding a story that you're happy to go with. Which is why when people post and say they're uncomfortable with mirrors/candles, or that they're afraid they're going to be thrown into a literal parallel universe, it's good to go "yes, look at it this way instead - now have a try". The important thing is that they get an experience of power.

People in the world find it hard to believe that just thinking about it will make it happen.

Well, they are kinda right about that. "The world is imagination", basically, but thinking about things doesn't do a great deal except create lots of experiences about your desire. This is an area where - if you're trying to specify things rather than just leap - a bit of detail is helpful.

Again its just my opinion that bombarding newbies with too much knowledge won't be beneficial 50% of the time...

It's a dilemma. So, we can respond by saying "don't ask too many questions, it'll be okay". After that, you have to give some sort of answer, which inevitably involves describing the larger perspective, or there's no way to discount the fears. I guess a more general questions are: Is this subreddit for newbies forever? Should it establish a larger "story" about dimensional jumping, beyond the basic one (which has little explanatory power, so can make people uneasy, since it is basically uncontrolled reformatting)? Should there be a revised FAQ or wiki for proper orientation?

They came here to get away from something.

This might be the issue. If you just want "change, any change" then that's fine. In reality-tweaking endeavours, though, it's almost always better to be going towards something. Lots of the questions here are about wanting a change but wanting to hold onto something at the same time. The authors of the Multidimensional Magick materials (a variant of this) said that (uncontrolled) "jumping" was a sort of world-suicide, and should be considered in those terms. That's about right. So even if the method doesn't matter too much ("let go, however you can persuade yourself to"), knowing how to specify a change is probably useful. And I personally think a coherent metaphor is a pretty valuable way to support that.

These are some really good points that need to be worked upon.

Yeah, I'm not sure on the best way forward. As I see it, there are four related subreddits (ignoring /r/Occult, is all over the place):

- /r/Glitch_in_the_Matrix where people are reporting unplanned changes they don't understand, discussing interpretations and the nature reality without a specific worldview.
- /r/LawOfAttraction where people are trying to make directed changes but without a real metaphor or view of reality, although there is knowledge scattered across its subscribers.
- /r/Oneirosophy which is exploring subjective reality and control in all respects, but it's a project of "practical philosophy", developing a worldview or metaphysics in addition to techniques, so not for the casual.
- /r/DimensionalJumping where people really just want a method rather without too much philosophy, but less vague than LOA. Results with a defined approach and a no-nonsense plausible idea.

My inclination is to say that this subreddit should keep it to basics. A simplified metaphor, but one with enough detail to make internal sense. A recommended way to formulate your intention. Some recommended ways to "jump".

And btw I didn't mean to say thinking. Bascially imagining it and putting your will to it?Deciding on it,kindof..Damn,we need some shorter term to explain it lol.Can't type it again and again.

I was having a chat with a friend at lunch today, trying to avoid the word "imagining" because its common use suggests either daydream fantasy or 3rd-person thinking. Difficult! Need to settle on some new vocabulary...

What I was getting at is, the way to formulate a specific intention is to directly or implicitly bring about a 1st-person perspective, expanded 3D sensory image. Summoning a shadow experience as if you were in the target "dimension" already. Even just a feeling from that point of view is sufficient (you don't actually have to "see" visuals or whatever). The stronger the emotional feeling you generate while doing this, or the longer you maintain the feeling, the more impact it'll have.

Most people don't notice they are thinking-from the 3rd-person or 1st-person, but that's the difference between failure and success I think. You always get results. But results

which mean you see something happen to someone else aren't so much fun!

When you get good, just having the idea of something that you want to happen brings this about. (You "decide" you want to meet a friend, the feeling-image that constitutes the decision, even subtly, is of you experiencing it rather than an idea about it.)

That or, y'know, something like... it. :-)

POST: Jumping back in time...

Reminds me of the film Somewhere in Time, based on the Richard Matheson novel. Christopher Reeve uses "hypnosis" to go back in time to be with the woman he loves:

SPOILERS

Visiting [Professor] Finney, Richard learns that the professor believes that he very briefly time traveled once to 1571 through the power of self-suggestion. To accomplish this feat of self-hypnosis, Finney tells Richard, one must remove from sight all things that are related to the current time and trick the mind into believing that one is in the past. . Richard again hypnotizes himself, this time with the tape recorder [playing recorded suggestions] hidden under the bed. He allows his absolute faith in his eventual success to become the trigger for the journey back through time. He drifts off to sleep and awakens on June 27, 1912 to the sound of whinnying horses.

What would time travel be? To the time traveler, it would just be a very discontinuous experience, a jump across the Infinite Grid. One evening experiencing "2015" then suddenly experiencing "2005". How would you account for the presence of different versions other people and the fact that you would be in a different world to the present, one that would unfold separately? Perhaps by considering the notion of extended persons and personal universes. If these things are possible, then you could equally just switch to a moment where your "someone" was with you now, or about to be. But that would have its own drawbacks in terms of shifting your apparent world. Either way, it's worth bearing in mind that attempting this sort of thing is effectively to let go of this world as it is completely. Would you not rather efficiently summon a new love, one perfectly aligned to who you are today?

All things to think about.

I'm still trying to wrap my head around the infinite grid.

The Infinite Grid is really just a way of saying that all possible experiences are always available in the background - everything is already created - it's just that you are "looking at" only one of them, only one "moment" is unfolded into your consciousness at a time. To change your experience is just to shift to another moment. Another way to think about it is that daily life is like an Imagination Room. Mistakenly, we think that what appears in our senses as all there is - but actually every possible thing is there, dissolved into the background. So in fact, you can "ask" for things that have nothing to do with what you are experiencing right now, that seem incredibly unlikely, and the more you let go, the more easily the "room" switches to those patterns. (That's what this "jumping" thing is all about: asking for an experience, and letting the world shift to it.)

I can't imagine even in .. forever.. that I would not still be in love with the same person.

Well, my own thinking is that other loves do come, which seem different but they are all the same love deep down, because there is only one "love". (Perhaps the first thing you can do is stop imagining that things are one way or the other, because it will place a restriction on what you let yourself experience. I do understand the feeling though.)

Another thing to contemplate is that "love" is actually something that is inside you, but which appears to you in the outside world as a way for you to become one with life, to join with it and recognise it's all just own seamless thing. Embrace life and it embraces you back. But that's all sounding a bit mystical, so I'll stop there! :-)

...

Good questions.

It's like the theory of quantum immortality?

Quantum immortality just says: you will keep having experiences. It doesn't really say much else. In my description, if you hit a "moment" which has no natural continuous "next-moment", you would experience a discontinuity. That might mean a jump where you suddenly missed that oncoming car after all. Or it might mean you experience "dying and leaving your body". What happens next, would depend somewhat on your beliefs and expectations. You might even experience losing all your memories and becoming a new person. Or you might just wake up in your bed, ten years earlier. In other words, the Infinite Grid contains all possible experiences, not just the one's where you are looking out of this body, doing your body-stuff.

I see. In the imagination room I suppose you could also change your own self? Although I guess that would require you to let go of your current reality. . . isn't it extremely difficult to change and imagine something drastically different from your current scenario?

Right. But there is a way around this. If you treat the sensory experience around you as just being a 'mirage' floating in your consciousness, then you realise it has no solidity. It's just the current unfolded moment. And the current moment has no causal power, no influence over what moment you might unfold next - unless you use it as the basis for your selection. Behind the scenes, the whole of time and space is available! Your intentions are already patterning your future experience, specifying the trajectory of moments that you will encounter. It's just that this takes a bit of faith to believe in, because you can't experience yourself intending - you only experience the results.

...

I asked this question a few months, playing the possibility of time travel since dimension jumping is possible. I think it is...idk though

Did you try it?

Not yet. Think ill give it a go soon.

The difficulty would be: you'd have to let go of all present-world-body experience except your sense of identity and memories. This isn't candles and mirrors. Effectively, it's fully entering a memory-seeded lucid dream or OBE that you then don't come back from.

So you stay in there....forever?

Well, there's no "in" there. Entering is probably the wrong word, because it makes it sound like Russian dolls (that you are in there, but outside of the dream you are still here). Switching to is better. Like changing channels on TV. You let go of one channel totally, and that lets you commit to another channel completely. It's like shifting from having one "dream about being dmitche on planet Earth" to having another "dream about being dmitche on planet Earth". I mean, I'm assuming OP wants to go "back" permanently from the wording of the post. If they just want a temporary experience, that's fine.

POST: Not sure if I want or can

As mentioned elsewhere, you don't need to worry about someone replacing you and so on - it doesn't work that way. Think of it just as:

- This is a process by which you deliberately select which experiences you want to have.
- Everyone else can do the same. The "universe" is set up in such a way as to allow everyone to have the experiences they desire simultaneously, even if they might seem to conflict with each other theoretically.
- Just definitely deciding you want all your loved ones to be the same while becoming back in touch with this person, is sufficient.

You might want to take a more controlled approach than the "mirrors & candle" approach though, to minimised side effects.

Thank you for your reply! Hearing that makes me... I don't know. I really need to at least to try this. It would be amazing to be able to change your life like this. What would be a more controlled approach, if I can ask?

I quite like Neville Goddard's description of what to do (see book recommendations in the post here).
The summary is:

- Get very relaxed, let go of all attachments, allow yourself to enter a state of "absolute allowing".
- Summon via your imagination a vivid, 3D experience of what it would be like if your desire was true right now - as if you were experiencing it, through your own eyes, around you right now. Really be there and feel it, feel it until it feels true.

It can be a silly simple scene - for instance, imagining being sat on a chair, all excited ("fuck yeah!") as you put your shoes on to go out and meet that person. So long as the scene implies that the desire has already happened and is true, it's fine. The way to view it is, by doing this you will be changing your world such that "it is true now that this will happen then". Like you've already updated the "time-landscape" of your future, and now you just have to enjoy experiencing it moment by moment until you eventually arrive at that point.

In a super-flexible world, you would imagine it so vividly that the scene would replace the scene that is around you now. You would simply have imagined yourself there directly... In a less flexible world, dimensional jumping gives you a sudden shift which occurs "out of sight". The Neville approach is more restrained, unfolds in time more, but is more controllable as a result.

Make sense?

EDIT: I'll just emphasise that the trick to this is to summon an extended, 3-dimensional experience in the space around you using your imagination, that you can feel out into like you are there. As opposed to thinking about the experience.

Thank you - I'm gonna try this. I'm just afraid that I can't do it since I'm a bit suspicious. (I know it's gonna be hard for me to imagine myself doing something.) But I'm trying my best to believe that this can be done. Many thanks!

Well, belief isn't necessarily that important, what important is not constantly second-guessing and therefore re-updating your patterns. It's a pretty automatic process.

Just do it for enjoyment - and if you get a result, great.

I state what I want and really try to believe it has already happened.

Trying implies a problem. Also, checking on progress isn't a great idea. Really, put all that aside. Simply accept it as fact that when you imagine something as if it were here now - your "brain" effortlessly works without sophistication to replicate that image in external life. It's just a law, nothing you have to do. It's like you cut a hole that shape in your perceptual filter, which lets experiences shine through which correspond to it. If you imagine an owl in front of you then subsequently the "owl pattern" will start to appear in your life. If you imagine other nice things, it's inevitable they will too. If you imagine feeling great, then patterns that have good feelings as part of them will be triggered. **This is a mechanical thing.** It's like triggering memories by recalling a part of them, and the rest appearing by "auto-complete". (A more complicated description can be found here [The Patterning of Experience], but you don't need it.)

Check out the Goddard books. There are specific examples in there of that sort of thing.

But I would say: Don't think in terms of escaping things. Instead, commit to this idea: That the experience you are having, and the history you remember, don't dictate what happens next. They are just a sign of your current pattern. So ignore them - and instead summon 1st-person immersive imagery of how it will be when you are in the situation you desire!

You don't solve problems by thinking them over and over. That's just reasserting the "problem state". The "solution state" comes from focusing on the desired outcome, then letting it take shape. This is true in everyday life (let a problem go, later your mind says "hey, I've solved that for you, here's the solution"); it's not just some esoteric thing. Think of this as goal-setting for experiences.

If you just want a change then the mirror+candle approach that started this off will give you that. Just make sure you get yourself in a good mood first.

POST: Logical question

[POST]

- Forgive me if this is n00bish, but here's what I don't get:
- A) I tell my friend I'm jumping
 - B) I successfully jump
 - C) Does my friend in my new dimension remember me telling them I jumped?

[END OF POST]

I also thought - if all the dimensions are not really parallel lives but probabilities, why bother 'changing dimensions' if you can change something in THIS dimension with the same effort? For example, what is the point of jumping into the dimension where you never had a disease (and mess around with the timeline), when you can (theoretically) eradicate it here?

It's just an enabling metaphor to let you have (near-)instantaneous change. It's probably better to say they are like "parallel dreams" rather than possibilities. I can be easier to conceive of detaching from one situation and attaching to another, than it is to convincingly argue how "dissolving disease" would work. Sometimes the mystery aspect is what helps things along.

I see it as changing the settings :-) once you change them, you can see how it is reflected around you.

Ha, yes, nice metaphor. :-)

I see it as updating or inserting new facts into the world. With the understanding that the "sharing model" of the world means it's basically mine to play with, and everyone gets a similar influence. Ongoing sensory experience then spontaneously falls into line with the updated facts.

BTW, talking about settings reminded me of the Hawaiian (allegedly) ho'oponopono technique - that would actually fit better on Oneirosophy, as its premise is that reality is internal, so if you want to change anything around you, you need to find a corresponding thing INSIDE you, and change that.

Yes, I've played with it! Essentially, it's about dissolving/overwriting troublesome aspects of yourself with the feeling of love/forgiveness. A book called Busting Loose From The Business Game has a similar approach based on "reclaiming your power" from events as they arise. My own generalised version turned into this Overwriting Yourself post.

I guess it makes sense that we should all be talking about basically the same thing. In effect: digging around in the background for facts we don't like, then deleting them!

I'd go so far as to say everything is inside you - even the room and situation you are experiencing right now - because you have no outside. The sensory experience is just a perceptual mirage floating in awareness - a partial slice of the real world, which is the world of facts dissolved into the background.

There is (or used to be) a similar ideological premise in traditional psychoanalysis

Jung played with "Active Imagination" which basically does this. I think it is very much out of favour now (if it was ever really in favour). These days it's all about semi-mechanical tools such as Cognitive Behaviour Therapy - they focus on activity rather than meaning. Which is a major error really.

That is also why I commented that jumping dimensions seems (to me) as merely a functional narrative...

I think you are exactly right: you are dreaming-imagining your experience.

Which means you are 'First Cause' for everything around you. But people find that difficult to get to grips with - "okay, now what do I do with that? how do I make things happen?" - because you cannot experience the making of changes. You are the change. To make a change is to take on a new shape, meaning there's a shifting of self but no "doing". So we invent 'Second Causes' or 'enablers', whether they be technological tools to make the changes on our behalf, or active metaphors such as "dimensional jumping" or whatever.

In all cases, it is we who make the changes directly. When we use a tool or technique, the tool is a result on the same level as the outcome. We cause them both; the whole story of "using this to make that happen" is our creation.

Extra thought: This problematic thinking is everywhere. For instance, people try to fix their posture by training muscles and pushing one bit versus another, etc. But your posture is the arrangement of you. There are no "parts" to posture. The only way to have better posture, better shape, is to re-shape as a whole. To... shift.

Actually, when I think back, I believe that most profound changes in my life happened when I slept. I have a habit of going to sleep when I am stressed, as I somehow hope I will wake up and things will be different. I remember once I was supposed to have a surgery, and I was very scared and upset - I had no idea what to do, so I went to sleep praying that somehow the problem would resolve itself. I spent a couple of days in bed, trying sort of GET OUT of the situation I was in, like trying to break out from the INSIDE. After that, I came back to my normal schedule, but after I had a second health check it turned out the problem was not there anymore, and I did not need a surgery after all. Now, it's not like it magically DISSAPEARED - but there was a clear shift in the severity of the problem, to the point when it didn't require any intervention. It was really neat - not a massive change, but a change enough. Only after I started reading this forum I thought that maybe, somehow, my talents at lucid dreaming are not as useless as I previously thought.

Ah, interesting story. I think sleeping with intent works quite well (and I'd see that movie). Which makes sense in this overall scheme - sleeping and dreaming is an opening of attention, a loosening of your hold on current patterns to let them shift.

One time, I had completely screwed up at work, and took the day off sick when I had the corresponding presentation. I slept/dreamt through that day and "deleted" it. I went into work after the weekend, and the project was never mentioned ever again. Good appraisals, etc.

It is sort of like they know, but they don't at the same time.

Right.

As I like to think of it, it's like you've changed some of the facts-of-the-world. Afterwards, people's natural spontaneous actions and thoughts arise from these updated facts. If you push them, it's like there's still a memory of the old ways - however they aren't seeding the current world. But I'd say the old memory was your old memory.

My thinking is that the fact you can push them on this at all is because you know you made the change, basically. And by probing them, you are getting back your own doubt on the matter. Implicitly, by questioning them you are brining the old fact back into existence.

Meanwhile, if you had made a change but you had no idea you were responsible - e.g. a strong imagining of a change in a daydream - you'd probably experience this as some sort of Mandela Effect type deal, and just be very confused that nobody could remember what you do.

I am not sure - I sometimes think there are those twilight situations, when you stil have one leg in one world - so to speak - and another in a different one, and for a moment both are possible. Or maybe I think of soemthing else entirely, but cannot identify it correctly.

I agree with that.

Hmm. The fact that you would entertain the previous history means you have not fully committed to the new facts. If you did - they wouldn't remember. But then how would you tell? Whatever version you try to investigate, that's what you'll get back!

Yes, maybe that is the way to put this, not being fully commited. Maybe these options sometimes are probable but transient, and if you don't commit yourself to them, they become ghost-options, that almost-happened, but never did. Like they were up for grabs, but you didn't use the opportunity and they went back to the ghost world.

You (as in, everyone) should experiment with the synchronicity thing. You will directly experience that the world reflects your firm opinion - or your indecision.

The personal experience is more like a dream which operates on an "as if" basis. If your worldview is fuzzy about certain things, then the evidence you encounter appears fuzzy or contradictory also. That's why I think we need to definitely decide what's going to happen regardless of current sensory evidence, rather than start with the evidence and try to "work out what to do" or what is possible.

(Also, I think that that type of change does not really require any dramatic jumps as it still fits into the previous narrative)

How to think about that? Well, anything "out of sight" can be changed. The more out of sight, the easier it is.

The first level of "seeing" is the sensory experience that you are having. The second level of "seeing" is the narrative you are holding onto. The third level of "seeing" would be more general facts about your life. Fourth level, increasingly diffuse facts about the larger world. These fictional levels are the order in which you focus on and fix things. Background inconsequential things are shifting all the time, or rather they are "fuzzy" and never fixed anyway. Meanwhile, the sensory experience is pretty locked down ("no disintegrations!", no teleportations).

Any level can be allowed to diffuse into "fuzziness" if you step back from it, but it's not so easy to retract from the senses or the main storyline. It's always easier to have a change if you can avoid an obvious discontinuity - if you "avert your gaze" as it were, from the thing you are changing, or at the very least look only for the intended outcome.

Sleeping while the world shifts is an extremely handy way of disconnecting from one set of facts and awakening to another set. It's one way that we permit discontinuities. Probably it happens all the time, but because we never pause and check "how it was before" we don't notice. (Just like the people who if prompted know that something used to be the other way, but their actions are coming from the new facts so they don't notice.)

I was thinking of an example, but nothing comes to mind ... it would be a situation which is weighing, with different outcomes open, and suddenly everyone goes blind to one of these options, somehow as it is not supported ... I am not sure how to phrase this.

The only example I can think of (which is not perfect, but maybe you will understand what I mean) is when I broke my toe and suddenly everyone got blind to this. I was mentioning it (and whinging), but it was like noone could hear it, or noone remembered it. I was quite upset when I had to remind my parents that I had a broked toe, but it was like it was going over their head. It did heal quickly and with no problems, but I discovered that sometimes when this is happening it is not good to push this, and just let it flow. EDIT: it is like the broken toe didn't belong to the timeline, or something (?). Silly example, I know. I am not sure if I made myself clear (and I apologise for my English, which is not my first language)

Reminds me a little of this story:

Changing the Past, Cindy - Cooperstown, New York
Several years ago I was walking through the woods and I fell. As I tumbled downhill, I heard awful sounds coming from my knee and ankle. I remember thinking that my knee was shattering. When I stopped rolling, I immediately put my hands up towards my leg to start a healing process, saying over and over in my mind frantically, "back in time, back in time."

It was getting dark, so after five minutes or so, I pulled myself up to the main path so I could be found. If I had stayed where I was maybe my ankle would have healed completely right away. When I got to the top, I started the healing again. Perhaps at that point it was for my sanity. I had just finished my second chemo treatment, and I was determined to stay focused on not taking on anything else. Since then, a guide of mine has helped me see the big picture, and I've learned that it's very interesting what we can and will do to get a merit badge, or should I say Spirit Badge! ~@:)
The paramedics told me that it was probably just a sprain. I know they didn't think that I was in pain, because I was calm and quiet, but on the inside I was screaming with pain... yet focused on reversing what had happened.
In the Emergency Room, I was told that I would probably have to have surgery on my ankle, because of the type of break it appeared to be. A few days later when I went to see the orthopedic doctor, he was looking at the x-rays and turned and looked at me with a puzzled look on his face. He said, "your ankle is broken in three places. It looks as though I had already set it ... they are aligned perfectly." I've often wondered if I had reversed a knee injury and had started on my ankle.

(I've had some experiences which you could, I guess, classify as 'jumping dimensions' - it felt, however, as if I was in a bad dream and desperately tried to divert my attention elsewhere, to the point where the situation changed.
I will give you an example.
I have very long hair, and sometimes I dream it is cut short. I am usually very upset by this, but I know it is a dream, and I concentrate for a while, and suddenly I have my long hair back on again (it's almost as 'log out, and log back in again). If I don't manage to do it in a dream, at some point I actually wake up for real, and my hair is still with me :-)
In 'reality' I had some situations that had the same feel - they were going in the very wrong direction, and some things seemed unavoidable, and suddenly everything 'magically' resolved itself, and sort of ... I don't know ... dissipated, and I felt as if I woke up from a bad dream. I suppose 'changing dimensions' is like this.

Ah, missed this - yes. That's a great example and description.

Found this article: [<http://www.stevepavlina.com/blog/2012/03/how-to-switch-dimensions/>]

Pavlina. We was always a bit of a dick, but was thought-provoking at least. Actually, I remember him experimenting with subjective reality stuff a long time ago. Think he killed his forums, but there was some interesting stuff there from people who had played with it a little.

IMHO, he had some really inspiring stuff going on before he started his sexual experiments and lost the focus.

Yes, that's where it went wrong, I remember. I think that was where he shifted from being "interesting and provocative" to "defensive and slimy". Shame he deleted the forums. A few good stories in there that would have made for good /r/DimensionalJumping or /r/Glitch_in_the_Matrix fodder.

POST: Are you really jumping to different universes...?

You need to view it completely from your own perspective. You are not a person walking about a world; you are a conscious perspective having a 1st-person experience. It's more like you are switching from "looking memories about being in Situation 1" to "looking at memories about being in Situation 2".

There are loads of ways to think about it (recent example), but all rely on you accepting that the "sharing model" of the world isn't simple - i.e. it's not like we are all in a room, choosing the consensus decor together. We are each in our own rooms, with different versions of the same people.

POST: Should I really try this?

This is a theory, but basically, when you jump, you're actually switching places with another version of you who is aware of jumping. They may or may not be a lot more different than you. This you may seem a little off to your family at first, but they may get used to it. As an example.. If the you you switch with becomes employed and starts making great grades and what not. Your family would just think of it as you making your life better, etc.

No, you are not switching places as such. You are shifting your attention to a different possible experience, more like.

Haha. Sure, try it. Sit in front of a mirror with a candle and concentrate as much as possible. Everything that will happen is that you waste some time of your day. Sorry that you'll hear it from me but you will never change your dimension. You'll be stuck with your current state, your bad grades and nothing will ever change this. Only you can change it yourself by getting off your ass and do something against it on your own, like learning more to get better grades and try/work hard to find a decent job. Supernatural stuff doesn't exist on earth. I don't know if any of the Religions out there are true or false and if an afterlife in heaven or something like that exists but right here, right now, you and any human on earth including all the people here in Reddit will never experience supernatural stuff. You can't jump dimensions, you can't bend a spoon with your mind and you shouldn't believe stupid stuff other people tell you.

Have you tried it? Now, some people get carried away, for sure, but if you commit to it you are pretty much guaranteed to encounter some subsequent effects.

People get hung up on the "dimensions" imagery, but it's really part of a much older idea: consciousness as primary, the apparent world experience as illusory. Or in philosophy, that the world-as-it-is is an "infinite gloop", which is formatted into meaning by the mind which perceives it.

Shift your own patterning/filtering, shift your experience. Your milage may vary...

Well I got the first part of what you said and I know that a lot of people on earth believe in something like this but that's just because of their inexperience. Your last sentence on the other hand doesn't make any sense at all. Just a couple of fancy words mixed together to sound amazing while there's no meaning behind them whatsoever. Back on the first part. I'll tell you a nice story: There's a scientific theory which is called "Last Thursdayism" which was a response to the "Omphalos Hypothesis". I'll explain you the meaning behind these scientific theories and the solution to them. Technically you could invent any fictional stuff you want and nobody could prove you wrong. For example the "Last Thursdayism" is the logic, that the world might have been created last thursday. Technically, you couldn't prove someone wrong who said that. You couldn't travel back in time before the thursday to prove it wrong. How could you ever prove, that the world wasn't created last thursday? You could say that 2 years ago you married your wife or stuff like that. I could reply that this thought was just implemented in your mind when you were created last thursday. You could say "But I got photos of the marriage." and I would answer you that God also created these photos to make you believe that you already existed 2 years ago. The thing is that scientists and any human on earth is allowed to disprove these theses or theories by declaring them as unreliable. It works by measurring how much you have to invent to keep the theory alive. In the end in our actual universe everything makes sense, everything that exists supports other existing things and supports the logic behind them. In the "Last Thursdayism" you would need to support everything by inventing more and more stuff and so you can say that the Last Thursdayism, even though you could never prove it wrong, is surely not real and people shouldn't believe it. Now back what I want to make you understand by this: Your "much older idea: consciousness as primary, the apparent world experience as illusory" is nonsense. It's Idiocy. It's simply not real and you are stupid to believe it is. If you would still reply with "No, I believe in it, why shouldn't it be real, for me it very well is real." I would answer you, that I got a real dinosaur pet that is invisible and only I can see it and that my story is by far more likely to be actually true/real than yours and the fun thing is, that the last statement is a fact. It would really be more likely to be true than your nonesense even though it's complete bullshit itself.

I think you misunderstand this whole thing.

First, I would never suggest someone believe something without putting it to the test. This is easy done in this case. If it's just a bit of a laugh, that's fine too.

On "consciousness is primary", you probably haven't done enough reading to understand the way in which that is meant. It's got nothing to do with imagination and belief as you describe. In philosophy, you might check out panpsychism and idealism; in older traditions, Hinduism and Buddhism and even early Christianity. For a modern take, cognitive scientist Donald Hoffman's interface theory is worth a look.

I get your point put you have to differentiate between religion and superstition.

Well, religions now are largely a bastardisation of their original form. There's a lot we could go in here, but the Western religions are really a mutated, cut-down version of a more mystical approach to living. They have taken literally what was intended as metaphorical, and have lots the original message and replaced it with something far more dubious - I would say.

I don't want you or anyone else in this subreddit to change anything of their way of thinking.

That is absolutely not what this subreddit is about. It's very much about: "here's an experience, check it out".

They just need a single comment that tells them that the stuff here is not true to understand that there are two sides.

But that's not how to do it (in my opinion). They shouldn't be believing anyone who says "this is true" or "this is not true". I think you are working against your aim by doing this.

What you really mean to say is: people should think for themselves, right?

If there isn't a single comment anywhere about all this being a joke...

Well, it's not a joke. You do make a good point, and I'm going to take on this suggestion. That good point is: we might better emphasise in the sidebar that people should make up their own minds.

By the way, i'm not a native english speaker so sorry for any bad wording, inappropriate words or sentences that are difficult to understand.

No problem. I appreciate that you are coming from a "good place" on this. But I also think you have maybe come to this subreddit with preconceptions - perhaps due to that /r/nosleep post (which I think is quite unfortunate).

Religions really changed a lot and are a bastardization of their original form.

The original ideas were about empowerment of the people. It's really sad to see how it has been flipped around. Certainly in religions where there is an "entity god" to be feared and who passed down moral laws and punishments! "Non-religion" religions like Zen Buddhism seem to have retained more of the original concept - giving people ways to have a better life - but even they get mangled when they are translated into western ideas, often.

Neville Goddard (who I mention in a post here) interpreted the Christian Bible as describing different metaphors for approaching living. In effect, he is talking about using the mind to set goals, and so on. Quite a lot of the stories in the Bible are about the relationship between mind and body, imagination and perception, and between action and results (including moral action). There's a lot of metaphysics in the Bible. Unfortunately, those stories are now taken literally, as if the people were actual people, rather than symbols for certain relationships.

All that knowledge gets lost and becomes about being obedient rather than thinking for ourselves. Shame.

Yes, but I need to explain this a little closer again so that you exactly understand what I mean: I read in a thread about a confused person...

Your basic idea is absolutely right - in that as more subscribers appear, they don't maybe understand the context of this. That's why I've added a note to emphasise how one should approach this sort of thing. I would much rather just assume that people would think critically, make their own judgements, perform their own experiments - but it does no harm (and much good) to emphasise the position taken in this subreddit.

(In other subreddits, such as /r/Oneirosophy which is about studying perception from a subjective idealist point of view, there are explicit warnings and that is a valid idea.)

Well yeah, everyone has his personal preconceptions, I'm sure of this. I usually lean my preconceptions on experiences and facts and not on what a random person said.

The way I think of this: I never take my own thoughts too seriously. I never "believe" my own thinking. That way, I'm happy to change and see things differently according to new experiences I might have, or new information I might come across.

...nosleep is about horror stories, so I can assume that the story didn't have a nice ending.

The "new" story has the guy "jumping" into a dimension where he discovers he has just murdered his parents (bummer). The original story for the subreddit is actually about an experience someone had with mirrors (follow the sidebar link) which was kicked from /r/nosleep for not being believable (ironically).

Personally, I think having /r/nosleep stories now using the concept and linking to this subreddit is not a good thing. Not much we can do about it though.

But some things depend on the religion.

Very true. I think the 'insights' are about the same thing, however they are of course filtered through the culture of the time, and then filtered through history, idea, and power-struggles. Maybe that's why the information needs 'refreshed' periodically - insights are re-discovered and re-presented, to make them understandable again.

In general, most people think for themselves and make their own judgements but...

Yes, I do agree wholeheartedly with this, as a moderator for both subreddits. This one only recently kicked off; at first it was a pretty focused set of people and it wasn't very likely that anyone would happen across it uneducated. It's important to be informed in things where real effects are produced but explanations are lacking. Often people joke around with such things - and then they get a result, and it's not such a laugh anymore.

I thought nosleep is about fictional stories because the first post I ever saw was the Dimensional Jump one.

Yeah, /r/nosleep is indeed mostly fictional; don't read it myself. As with all those subreddits, there is some confusion, but that one is intended to be "fictional but play along" whereas /r/thetruthishere is about "true unexplained mysterious events" and /r/Glitch_in_the_Matrix is intended to be fairly dry reports about unusual experiences.

I don't deny that mysterious events can occur. But they are only mysterious events as long as we don't yet have a plausible scientific explanation for it.

Well, not all explanations are "scientific" because that only deals with a certain methodology - but I certainly agree. There is no such thing as supernatural, there are only experiences for which we do not have an account. For some experiences, perhaps we never will. But that doesn't mean they are "beyond reality".

Unusual experiences are great but if they really occurred, then there just be an explanation for them.

We are not so far apart really.

If someone experiences something, they experienced it. Whatever the nature of that experience is, that's for discussion. In many cases we may never know - in others, we might gather enough anecdotes to come up with a theory.

Nothing can occur that is impossible with our laws of nature (aka what science has discovered so far).

Of course, the "laws" of nature don't say what is possible or impossible. They are not laws in that sense (they don't say "what is legal"). Rather, they are the simplest regularities we have observed, with the broadest applicability. They are "conclusions from the evidence so far".

If an observation is made which is contrary to one of these regularities, then we try to rework the theory to fit the observation. That's what science is all about.

Actually, Wikipedia for a change has a pretty good definition of a physical law [https://en.wikipedia.org/wiki/Scientific_law#Laws_of_physics].

(One of my pet hates is that people confuse the notion of a fixed or "given" law with the idea of a "physical law". If we'd taken that viewpoint in previous centuries, we wouldn't have got anywhere.)

POST: I feel like there are fakes

[POST]

By that i mean i feel like there are a lot of people lying about jumping on here. I say this because if you jump dimensions, how could you come back on reddit in this dimension and share about it. You know, since there is no known way to return back to your original dimension

[END OF POST]

Guess what, 100% of the people here are fake. Jumping Dimensions is a joke. It's not real. It doesn't exist. I could make a fake account and share my experience of a fictional Jump and people would believe me. I could talk about all the coincidences and stuff that happened and ask questions if this or that happening is normal and people would answer me how that's completely normal and stuff like this can happen, even though I was lying the whole time and these fakers would perfectly play into my hands. =)

Hmm, so what exactly is the point of you participating here? You don't seem to understand the underlying concept vs the metaphor, and seem... opposed and defensive about the whole idea of (I guess) occult type projects or glitch type reports. Why bother posting?

Because there was a /r/nosleep reference to this subreddit and several thousands of poeple are currently checking this subreddit out for fun and are new here. Out of these thousands of people there are a few that are too young or not educated enough or haven't realized yet, that a lot on the internet is troll and fake. I don't want these very few young and/or uneducated people that came here to believe that the nonsense on this subreddit is real. I think I help them a lot by making them understand early that this subreddit is just a stupid joke so that they don't bother with it for too long and don't get sad afterwards when they sooner or later find out, that it's not real.

Admirable public service announcement. But warnings from ignorance or fearful discomfort don't help anyone. Are you really so worried that a few folk might look in a mirror?

I think we need to trust people to make up their own minds - take responsibility for informing themselves first. Which, ironically, you haven't!

There is no ignorance or fearful discomfort behind that. I wouldn't be here talking freely to you if I had a fearful discomfort about these things and it would only be ignorance if these things about dimensional jumping EVER had a piece of truth behind them to support them, which they don't have. It is as wrong and as much of a lie as an old woman looking into a crystal ball telling you your future. It's as wrong as some TV series where someone tells you your personality or future based on your asterisk or some cards he/she randomly pulled out of a deck to earn money through exploiting your human weakness of being concerned and worried about things and your future. You/the subreddit are not pushing anyone and not taking money from anybody so what you're doing here is not illegal and might be a nice hobby for some people. The "public announcement" how you like to call it is just there to not make people believe in these lies and fantasies other people tell them. Like I said, I dont want people to get sad after they realize that something, which sounds as nice as dimension jumping, is actually just fiction. They could put their hopes into this theory, hoping that it changes their lives which are currently in a bad state and in the end all their hopes get crushed. Or they drown from reality by never stopping to believe in such mystical bullshit aka superstition, which for obvious reasons has a bad reputation in reality and normal life.

I don't mean fearful quite like that. And perhaps I am misjudging you. I meant it more in the sense of someone fearful that the world isn't quite like they assume, and resistant to other people even looking at it for themselves.

I think you are showing little confidence in people to make judgements, from their own evidence!

Your comparisons don't work because this subreddit literally arose from people's "hey check this out" story. Much as /r/Glitch_in_the_Matrix did. A phenomenon was noted, there are several ways to try and replicate it for yourself. If you don't manage to replicate it, nothing lost.

We might compare this situation to lucid dreaming: its existence was denied for many years, older traditional accounts were dismissed as nonsense, many people were quite aggressive about opposing the possibility of it due to its implications for theories on dreaming/waking, eventually the sheer number of reports led to a study which led to greater acceptance. The same thing happened with hypnosis (still not understood).

EDIT: In both cases (even now) it's up to people to try it for themselves. It really doesn't matter whether anyone believes in these things or not, just as some philosophers believe theoretically that "consciousness is an illusion" but I'm still pretty much convinced I am conscious from personal experience...

Don't worry, I completely understood what you meant by fearful and since I know the world is like it is and not like people in this subreddit say and dimensional jumps dont exist, I'm very condifent and there's nothing that bothers me. I might show little confidence in other people's judements but that's based on facts and a good understanding of logic, physics, chemistry and therefore what is possible and what is not. And if someone is talking about something that you can scientifically prove to be impossible, then I show little mercy to somebody who's trying to convince me of believing it or to defend people who believe it. I want to repeat again that I dont want anyone here to stop believe in what he believes. I just want to make it clear that my point of view and the truth is, that what he/she is believing isn't true. You just have to accept that. It's based on the knowledge the humans have discovered so far. Any scientist can prove that dimensional jumps like this with a stupid mirror and a candle don't work and that everything you believe to happen is just fictional. That's why out of 7 billion people, not a single one of them would be able to do a dimensional jump because it simply doesn't exist. That's why I dont need to try and experience/replicate it myself. It's like somebody tells me I'll survive when I jump out of the 40th level of a building head first into the street. It's obviously proven to be deadly to a human body and if we take some unbelievable luck and coincidences aside, then 100% of the people doing that would die. So I don't need to try it out myself first to believe it, when I know the definite result beforehand. You can't compare Lucid Dreaming to dimensional jumps. Even if Lucid Dreaming at one point in time was considered to be nonsense, you could never completely disprove it since at that time and still today we don't know everything (but a lot) about dreams and dreaming yet. It never was something that you could disprove by facts since it was so badly explored yet. Unlike that, we have very well explored mirrors and candles and a person who's sitting on he floor trying very hard to concentrate. We can definitely prove that this won't change anything and that nothing will happen and therefore dimensional jumps are impossible and therefore you can't compare it in the slightest to Lucid Dreaming. Hypnosis is a difficult topic since, like you already said, it's not yet completely investigated. Unlike the dimensional jump thingy, you dont just have a candle and a mirror that won't do anything. The hypnosis is something that is done in different ways. I don't know enough about the topic but a person talking to you and giving you orders to concentrate on yourself, trying to focus on something specific, using special words and wordings and trying to manipulate you with what he's saying and wants you to believe or using the pulsating pattern of a pendulum, which could make you a little dizzy or whatever and many, many, many, many other things could eventually result in an effect in your brain, which is completely reasonable and physically/chemically reasonable. However, I think these effects are very minor and can't make any big change like you believing that you're a chicken. Maybe it could make you believe that you're arms feel really heavy even though they obviously aren't. Personally, I never believed in hypnosis and I am very very sure, that it doesn't work on me no matter which expert would try it on me. There's also the form of Hypnosis called "Trance", which can result in different conditions of yourself after a highly mental concentration but this minor effect (if it is even noticable) is also just completely reasonable on a chemical level and won't cause anything superhuman or supernatural.

Hey, thanks for engaging here, you've put a lot of thought into it and it's appreciated.

A few points:

- I wouldn't get hung up on the candles-and-mirror thing; that's just a method of detaching from the current sensory experience.
- Science cannot investigate subjective experience. That's not what it's for. Science is about identifying shared "observed regularities" and making connective stories about them. Science is not about "truth". It's about coming up with the best predictive model for a particular phenomenon. It describes observations, not how things are.
- The problem with lucid dreaming and hypnosis is, like 'jumping', they are about subjective experience. Only personal experimentation can reveal the facts of the matter to you, one way or the other.
- When we are dealing with these things, philosophy and metaphysics are the appropriate areas.

We should be clear and not appeal to vague hand-waving science when it comes to these things - there presently no physical-chemical descriptions which account for subjective experience. There is no explanation for consciousness, or even an idea about what form such an explanation would take. (Refer to Donald Hoffman and neuroscientist Krisoff Koch for interesting takes here.) Repeat: there are no good models which match the facts. We don't even know why we perceive objects, how perception

works at all, how eyesight works. So we must conduct our own investigations. Where science ends, personal investigation and judgement must begin. Random good article: George Ellis [<https://www.scientificamerican.com/blog/cross-check/physicist-george-ellis-knocks-physicists-for-knocking-philosophy-falsification-free-will/>].

Q: Well first off, I find it important that we differentiate between "phylosophy and metaphysics", "definite science" and "higher science"...
Definite science is the science that can definitely prove and disprove things, it's about daily life and things we have very well discovered already and facts we can definitely draw.
The higher science is the science of theories, models and other constructions that we aren't a 100% sure about, which could be the proven definite science of the future. I think definite science can very well investigate human experience. Subjective experience might be a bit tricky but we can draw general similarities between humans and statistically a human brain should work just the same way as another one.
That said, we've discovered a lot in chemistry. About messengers (biochemical prozess in your brain) and how it effects our perception and body in general.
We use electroencephylography (EEG) to measure the electric currents on your brain to understand why and how lucid dreams happen. It's definitely not the most accurate way to understand the human brain and just a little step forward but it can definitely show and prove different and particular things that happen in our brain in various occasions.
// So now where I have left over:
It's definitely not just vague hand-waving science. We can exactly tell how people perceive objects and how perception works and your eyesight. We've discovered long ago how all that stuff works and how your brain processes information. That said, through these knowledge we can determine whether something is possible to happen and what the changes could be and what a particular event could cause in your subjective perception and experience.
So science can very well prove, that for any individual, something like dimensional jumping doesn't work. You can do the process but nothing will happen at all. There's no chance, no scar that could ever disappear, nothing that wouldn't be like it was before that doesn't revert back. It's simply impossible and just superstition that makes you believe that something changed, but in fact, nothing ever changed. There's no chemical or biological or physical process, in which a dimensional jump could ever occur and in which reality could ever change.

[Hi, thanks for continuing! This has been an interesting exploration.]

Science, Definite, Indefinite

Definite science and higher science

Well, your distinction is arbitrary I'd say. A model which does not connect to observation is not a scientific model - it's just a conceptual framework. What you really mean is: proven theories vs unproven theories.

It is worth reading the George Ellis article in Nature on this very point. The article begins thus:

This year, debates in physics circles took a worrying turn. Faced with difficulties in applying fundamental theories to the observed Universe, some researchers called for a change in how theoretical physics is done. They began to argue — explicitly — that if a theory is sufficiently elegant and explanatory, it need not be tested experimentally, breaking with centuries of philosophical tradition of defining scientific knowledge as empirical. We disagree.
-- Scientific method: Defend the integrity of physics, George Ellis & Joe Silk

It's the difference between something corresponding to experiment versus it simply being self-consistent.

I think definite science can very well investigate human experience.

Science is the investigation of human experience, definitely. There is nothing else for us except human experience - and all human experience is subjective. It has a limitation though: That it can only deal with those experiences which can be shared symbolically and which can be accessed in simple, describable ways. This puts much of subjective experience out of reach.

It can definitely show and prove different and particular things that happen in our brain in various occasions.

Certainly. Observing brains even allows us to correlate certain 3rd-person imagery with certain 3rd-person reported experience. However, it does not allow us to observe and measure the experience. This cannot be done. That's not a problem really, it's just a recognition of what we are actually doing with science. It's all "inside us" and we can't get outside to measure it.

Intermission: An Exercise

Here's a worthwhile little exercise which emphasises the limitations we have:

- Point to your real hand.
- If you are pointing to any particular location - stop.
- Even by the standard explanation, the hand that you are pointing to isn't your "real" hand - it's a construction of the brain, inferred by sensory inputs.
- Try again...
- So it becomes obvious that wherever the "real" hand is (assuming there is one), it is "outside of all this". And what you are experiencing right now is effectively a "perceptual dream".
- Note: If you end up pointing to your head (where your "brain" is), then start again but this time ask: where is your "real" head?
- Bonus point: Now, think about your real hand. Where does that thought appear? Does it not appear in the same "perceptual space" as your sensory experiences? You just can't get "outside" of this!

Vision, Perception, Neuroscience

We can exactly tell how people perceive objects and how perception works and your eyesight. We've discovered long ago how all that stuff works and how your brain processes information.

Unfortunately, we really haven't. Perception remains largely mysterious and unexplained. We can observe light going into the eyes, we can observe regions of the brain "lighting up" (terrible phrasing) but we do not have an explanation for perception. Cognitive scientist Donald Hoffman's interface theory talk is definitely worth your time. It specifically talks about visual perception from the beginning. I strongly recommend watching that talk. You can also read his related paper on Conscious Realism.

Meanwhile, retired neuroscientist Raymond Tallis has a reasonable article that's worth reading for another perspective. Now, I don't entirely agree with him, but it nicely outlines the various considerations.

Proving, Disproving, Experiences

So science can very well prove, that for any individual, something like dimensional jumping doesn't work.

This statement doesn't remotely follow from what you've just said, unfortunately.

It's simply impossible and just superstition that makes you believe that something changed, but in fact, nothing ever changed.

If you experience a change, and that change persist, then something did change - right? Although in a sense you are correct: in some philosophies, a change is a shift of perspective with reference to an unchanging structure, rather than an actual change in the world.

There's no chemical or biological or physical process, in which a dimensional jump could ever occur and in which reality could ever change.

Again, I must return you to a previous statement: Lack of an explanation does not mean lack of a phenomenon. If you experience something, it happens, regardless of whether you can account for it.

It would probably help to return to a question I asked in an earlier post: Can you prove that you are conscious? Can your prove that you have thoughts? Can you explain consciousness? Can you explain thoughts?

Does your lack of proof and explanation mean you have neither?

Note: A hand-waving "explanation" that these things "happen in the brain" or "emerge somehow" is not an explanation at all. If you can't say how it works, precisely then you have categorised it rather than explained it. The more closely you examine these things (for instance: vision) the more you realise we haven't explained them at all.

Outside, Inside, Nowhere

So I'm going to jump ahead here without having developed the full path for it, however all the essentials are there if you follow your experience, so...

We might summarise much of the above by saying that you are imagining an outside world, and you are thinking-about an world, that you have no evidence for other than the imagining of it. Earlier I said that:

- Science = senses + imagination

By now you probably realise that the true situation is actually:

- Science = imagination + imagination

On Perception

When we feel something, there's an electrical impulse sending information to our brain, which then it processes and it gives you the answer whether it's cold or hard, hard or soft, rough or smooth, etc.

That... isn't an explanation. Can't you see that? What do you even mean by "gives you an answer". Where and what is the "you" for starters! Keeping basic though, there are two ways in which this isn't an explanation:

- It doesn't remotely describe how light entering the eye is transformed into a full perceived environment.
- It doesn't remotely account for subjective experiencing.

You've basically said "the brain takes light and turns it into an image". That is not an explanation, you have described no processes whatsoever. You've said "magic", to link to an oft-used illustration.

Perhaps it's good to get back to basics. Light enters the eye, hits the retina, as an inverted image (although from the eye's perspective, it's not an image, it's a series of activated rods and cones of course). That information enters the brain. From a subjective point of view, my actual experience, I see a complete and unwavering room with objects which are spatially-extended in an environment. How exactly is this produced?

We do not have an account. It's fine not to know, but to say we do know when we don't seems unwise. A full description of perception will, in my opinion, incorporate complex memory. We do not see directly, we see (loosely) the thoughts that are triggered by information that enters our brain - which is of course then also an imagining... ;-)

Proving, Disproving, Experiences

You can take a subject group and let them try the dimensional jump with whatever instruction it would be possible for them.

You are kind of missing the point here, because you are assuming we live in a "simply-shared world", which we do not. Dimensional jumping by its very nature cannot be studied scientifically (which means, "intersubjectively") because it "comes before" the basic formatting (check out our man Immanuel Kant - easy intro but slightly wrong; better into here). It is a matter of metaphysics really.

Science = imagination + imagination No. Not at all. That's complete bullshit. Any scientist who ever lived/lives on this world would scream with laughter about that equation. It's absolute nonsense.

It's exactly how it is. Our perceptual experience is an imaginary one, "inspired by" accumulated information, triggered by snippets. We then make up connective stories in our imagination. Amusingly, the stories we adopt then inform our subsequent experiences.

Your mind is a big happy fiction machine, feeding upon itself. Having been told this, you'll probably start to notice it in the coming weeks.

- Experiences leave traces which in-form subsequent experience.
- Thoughts are experiences too, which also act as in-form-ation for subsequent experience.
- Your life is a big, looping metaphor machine and you didn't know it until right now.

On Consciousness

Man, you didn't even try with the consciousness thing. I'm really disappointed! ;-)

We simply have to answer this by saying that we have to accept that the universe exists and that we are real. So our thoughts and consciousness is too.

Okay, why not try this: The only thing you know for certain is that you are experiencing, therefore you are conscious and that you exist. Although you know that you are having experiences and thoughts, it is impossible for you to say what their nature is. You can think-about their nature, but that will just be another experience.

In effect we end up saying: All we know is that we are experiencing. And what we are experiencing is a real... experience. We cannot say that it is a "real" anything-else though.

There's no reality where dimensional jumps ever exist.

All that is required for dimensional jumps to exist, is for them to be experienced.

My post doesn't underlie any faith ... It underlies science and reality. Facts.

But it seems to me that you don't even know that science, reality, and facts actually are. Except (now) you might say that they are experiences. Beyond that, though?

I think if you read again what i've just written in my post, you should realize that dimensional jumps don't exist and that we can even prove that it is impossible and just a big hoax.

Unfortunately not. If anything, what you have done is further convince me that what I might have assumed was a solid world is in fact... a transient illusion, with no solidity at all, made up only of my experiencing of it.

In fact, I think you have convinced me that dimensional jumping - being a persistent experience - is perfectly possible and is not contrary to anything other than... previous habits.

POST: Just another skeptic..

[POST]

Hey guys! I really can't believe I'm posting this , but see , can't this phenomenon all be explained?

(This is kinda my first post , so sorry about the formatting)

My theory is kinda hard to explain , but I explain it easier to explain with an example. When we all were kids , we had that constant fear of a monster under our bed (assume you did) We took whatever sounds that occurred to be that monster! Our brains were searching for some evidence to show that our strong belief in something non-existent to be true (our brain is basically trying to screw us up!) So similarly , the process of dimension shifting , that sudden blurriness , all of it , its just some kinda evidence our brain is coming up to show that dimension jumping(what we believe in) is true! Even the changes! We search for the smallest changes to be true! It can be a coincidence , like that post where a redditor did a good dimension jump into a dimension where her fiancé complimented her on her looks! That person was looking for , or noticing the compliments she got about her looks!

Let's think of it as this way , If something happens when ur not expecting something , you wouldn't even be surprised. But if something happens (or changes) when your expecting something to happen/change (after a dimension jump) you'd automatically link it to the jump , wouldn't you?

So yeah , I think you kinda got my idea , I tried explaining it every way I could! Have a good day!

[END OF POST]

There's something to be said for seeing what you are looking for, definitely. However, it really doesn't explain some if the side effects - unless you view them as "memory mangling".

Side effects? As in?

Events that happened last week didn't actually happen, that sort of thing. The argument you had never occurred. That person never got sacked after all. Lots of "but I'm sure that..." things which are unrelated to your intention.

Maybe déjà vu can also be the reason for that c: But , we can never know if the person who claims that is lying or not.

Yeah. Or some other sort of memory mangling! How could we tell the difference? One of the 'problems' with this is that it is a subjective experience (of course). So by its very nature all evidence is going to be anecdotal. But that's why this subreddit isn't about proving anything to anyone. It amounts to: Some people have had an experience, here's how you can maybe produce that for yourself, you decide. You could see it as a targeted or practical version of /r/Glitch_in_the_Matrix. People do have unusual experiences. Some of them would be useful if harnessed. Is this one way to harness these 'glitch' type effects?

In the end, all that's going to matter is that for you the world apparently changed in a useful way and didn't revert back.

TriumphantGeorge Compendium - Part 14

POST: /u/Kazymir told me to stay off this sub...

Plot twist: Nobody was human anyway, they were just "having a human experience". Although I won't hear a word said against The Intelligence. He's knows loads of interesting facts, always gets his round at the bar, a generally nice guy. It's best not to mention his "appendages" though...

I'm just on a mission here. There are actually people who newly came here and seriously think this stuff is real so I'll just answer them the truth about all this being a joke.

The idea here is that people can take it or leave it: do the experiments and see what happens, or not. There's no debate or opinion to be had. There's no worldview being pushed; except try stuff see if it works or not. If it's not for you, nothing is lost, except a bit of time, which was probably going to be spent in bed or in front of the TV anyway. Think of it as a practical /r/Glitch_in_the_Matrix or /r/Occult centred around a particularly powerful active metaphor built on the philosophical concept of Idealism.

If it's just a kind of metaphor that's nice. People can use it to have fun and relax their mind. But people in here are actually talking about literally jumping dimensions. So this isn't a metaphor anymore. They're lying so much nonsense that it literally hurts my brain. I dont understand how people can be so stupid to believe in this bullshit.

It's a metaphor to trigger a genuine effect. The "dimensions" imagery does get confusing; it would be better to say something like "state jumping" or "format shifting". But then you have to talk about the structuring of mind and conscious experience. Changes are experienced. The nature of those changes, that's something else. It is easier to do just by having a go. But note that nobody's pushing it here - "there's an interesting phenomenon, you might be able to leverage it, up to you".

They aren't real the people just think they are.

Hmm, how do you tell the difference? If something was one way but is now another way, if a prior event seems now not to have happened, is that not "actually real"?

Or do you mean like "in a real way beyond our sensory experience"?

Not sure what you mean by placebo and biases. What's the mechanism behind those?

The Placebo Effect is a scientific proven effect, that you believe to actually feel a change, even though there is none.

That is not what the placebo effect is. The placebo effect is a genuine change which occurs despite there being no mechanistic cause for it. Many good studies. This one is quite interesting. To repeat, the placebo effect means an "actual" result. That's why people are interested in studying it!

Biases is very general meant.

You are reaching for something like "confirmation bias" here, I suppose? That certainly occurs. Here though, we are talking about something a little different. Hmm. I think you have mixed some things up here: hypnosis, confirmation bias, placebo effect, sensory experience, the concept of "the real".

But it comes down to something quite simple: if you experience something, and your experience remains consistent with it afterwards and doesn't revert, in what way is that not "real"?

So like you said i mean the "in a real way beyond our sensory experience" - real.

There is no "real" beyond sensory experience. Our consistent, intersubjective sensory experience is exactly what we call real. Anything else is... imagination. Imagining that there is something else beyond what you are experiencing - a world we can never reach that is "how it really is". Now that is fantasy!

What is a headache except for the sensation of an ache in the head area? If that sensation goes away, then your headache has been solved.

This is very important generally:

- Not having an explanation for something doesn't mean it isn't a real phenomenon.
- Not understanding something does not mean it doesn't happen.

If we don't accept that, then science wouldn't get anywhere, because fresh observations usually don't have models to back them up. (In fact, the story of science has often been about resisting new discoveries because they can't yet be accounted for, but that is a different conversation.)

[EDIT: Please take this in the playful spirit in which it is intended! Upon re-reading, it might sound more aggressive than it was intended to be!]

Placebo Effect

That's what i meant that nothing changed. You NEVER got a medicine that helped, your mind just tricked you and by tricking yourself it surprisingly helped.

Perhaps this is a language issue! Something did change. Your body did change. We agree on this, right?

What you are trying to say is maybe: "expecting that something is going to happen gives the same result as doing something which is supposed to make it happen". Of course, perhaps all pills are placebo-based. Perhaps they don't really do much of anything anyway. Perhaps all medicine is "pretend" to some extent - whether because the doctor believes in it, or the patient believes in it.

Maybe we should update our sentence to say: "one person expecting that something is going to happen gives the same result as another person expecting something is going to happen"... ;-)

After all, it does seem as though the truth wears off over time [<https://www.newyorker.com/magazine/2010/12/13/the-truth-wears-off>].

Science and The Real

Anyone who says something changed and didn't revert afterwards is simply lying. That stuff never happened. I don't believe you because it's impossible and the possibility of it being impossible is 100% and scientists can prove that.

So you are saying:

- That even if someone has an experience of something changing, they are lying?
- And that scientists can prove something is impossible?
- And that scientists have or could design and implement a study which could examine this effect?

I suggest that all these statements are dubious or incorrect.

There is a "real" beyond sensory experience. I know a lot define their sensory experience as real BUT you can't do that always. There are many sorts of real.

You are incorrect and you completely misunderstand what science is and what it can do. To repeat:

- Science makes observations using the senses.
- Science notices regularities in those observations.
- It picks out those observations which can be easily repeated by different people.
- It gathers accounts from those different people.
- It then makes up stories - conceptual frameworks, models, metaphors - which connect the different observations, using the imagination of the scientist.
- Science = senses + imagination.

And that's why it works so well. It takes the common, repeatable, simplified aspects of experience and, with imaginative stories, makes powerful tools from them.

Scientific Proof

Anyone can scientifically prove that dimensional jumping doesn't exist.
You can prove scientifically that it's impossible and definitely nonsense

Really? How... exactly?

Meanwhile, do you believe that you are conscious and that you have thoughts? Prove it. (It's a good exercise to go through.)

I suggest that what underlies your post is faith and is completely unscientific. Particularly since you are using phrases like "the mind tricked you and by tricking yourself it surprisingly helped", as if it were an explanation of some sort..

My Brain Is Lying

And the people who believe to see or feel a change that didn't revert afterwards are either lying or their brain makes them believe that it's real (with their sensory experience) even though in reality it is not.

How exactly does this work?

Are you not concerned that, right now, all the things you think are true are just "your brain tricking you and making you believe they are real"? That in fact, your experiences are just based on ideas you picked up and believed along the way, with no grounding in fact whatsoever? ;-)

Hey, will follow this up later, but we need to be clear on our definitions of the placebo effect.

The Placebo Effect

From the 2014 paper Outsmarting the Placebo Effect we have the following definition:

The placebo effect—real improvement brought on by the expectation of receiving treatment—can offer significant relief for patients.

To emphasise: The placebo effect is when actual persistent change occurs. The patient does not receive treatment but has the same outcome as if they did receive treatment. What you have described is... something else. You are describing someone "feeling better" but not really being better. The placebo effect is when people actually get better. Otherwise it wouldn't be an effect worth commenting on at all!

To emphasise again: The placebo effect is when something actually does change even though no active medicine was applied. It is not just about subjective experience. The mechanism is unknown, but a result is obtained without there being an apparent cause.

It is nothing to do with being "fooled". Unless it's the whole universe, reality itself, that is "fooled". Which would be good enough for most people, I'd say...

AI: get em george

Heheh. Well, I'm just pushing for clear-thinking all round...

The Placebo Effect - Continued - Untricking

Right, I think we're getting clearer now, and I see where we're disagreeing. Here's my broad definition:

The placebo effect is the phenomenon of someone's symptoms improving when they've only been given a dummy treatment, or even after they've just seen a doctor.
--Clinical trials and medical research, NHS UK

(Note, I don't endorse the site, just as I wouldn't endorse WebMD either, I just grabbed it because it was a good phrasing. The original article that got me exploring this was actually a New Yorker article back in 2011.)

Would you agree with this? The reason I'm pushing for this is that it's not just "feeling better". Does that make sense? In other words, if there is a mechanism it is not simply, say, pain suppression. That's why I push back against the idea that you are being "fooled by your brain". Which is no explanation at all.

If I were to offer an account of the placebo effect (the alleviation of symptoms by a non-active process) I would say it's to do with a "release" of some sort - an "allowing". I wouldn't say the brain is being tricked, so much as it is being un-tricked. Which is where a link comes in...

I'll try and dig this out, but there was a good study of back pain a while back. People would go to the doctor, complaining of pain, and they'd get scanned and there would be misshapen discs and so on. Operations would follow. However... people with the exact same apparent issues had no pain, no restriction. The deformations weren't actual causal to the pain; they were only being picked up because attention had been drawn to them.

In the same way, I suspect that many "issues" are non-issues in fact. That the "causes" detected are often unrelated to the experience of the patient, and only being discovered because of the investigation that results from the complain. In other words, "placebo" is a matter of there not being much of an illness in the first place. This is different to "healing" which is a whole other thing (it may be a matter of degree, however).

...just like I did on the whole dimensional jump-thing.

We've likely lost focus here, so let's bring it back around: how does this related to dimensional jumping, in your view?

The Placebo Effect - Continued - Double Tricking!

Let's perhaps summarise the placebo effect as you have discussed it so far (because we really want to focus this on dimensional jumping). I think I didn't properly communicate my idea on "untricking" so we'll put that aside. Let's also put aside the negative placebo effect, to help us stay focused.

Taking into account your whole comment, you are saying:

- The placebo effect is when your brain "tricks you" into feeling better, when there is no apparent physical change. In this case we have (say) been experiencing pain, and after the placebo treatment that pain is no longer experienced. (I am putting aside that symptoms more generally are often alleviated, not just pain and the like. However, that's not important for our discussion.)
- Dimensional jumping is when someone imagines that the world has changed, but in fact it has not. If they think there is a visual change, they are crazy or fuzzy-headed. (I am putting aside the possibility that people are lying about their accounts.)

In both cases you are saying that the only possible thing that can happen is that we might "feel a bit different". Anything beyond that, and we are "tricked and wrong", no matter what our experiences are. That...

No matter what seems to happen, we are tricked and wrong, or not clear-thinking enough, or mentally ill, or lying.

Is that really your position? You have offered no mechanisms for "biases" and "placebo", so really the only explanations you are offering are illness or lying.

It seems to me that you are starting from the position that all that can happen with regards to 'placebo' or to 'jumping' is that the brain can trick you into a feeling, or that you are wrong somehow. You are screaming "it can't be true! no matter what!". This is hardly an research-based approach...

If I could guarantee you an experience, an experience that was undeniably more than just "feeling" or "biases", an experience that was so obviously about the big world changing rather than just little you, the world coming at you with changes from the outside - would you take it?

Do you like owls?

Sorry man. I'm done talking to an uneducated guy who doesn't understand the basic knowledge that is taught at school and believes in Scientology and supernatural stuff that doesn't exist.

I read your other post. Not sure why you are talking about Scientology and the supernatural! Okay, quick summary response (I'm not talking about the subreddit topic here, this was all about science, perception and consciousness). Your problem is that your education in science, philosophy and metaphysics probably is stuck at high-school level. That's not a problem of course, but it does leave you in the position where you "do not know what you do not know". Most of the problems with our discussion was because you haven't really thought about these things properly and in depth. Things that seem "obvious" to you are actually not so when you look deeper into the details. In physics we have tackled lots of things (although we still don't have a good description of quantum mechanics other than "it's maths and it works"), but when it comes to explaining the mind we are basically right at the start. We are not as far along as reading popular science articles would have you believe. I'll leave you with one final thought to ponder: Do you genuinely feel, right now, that your experience is made up of neurons? If you don't, that means there is a gap we need to find an explanation for. (There are actually many gaps like this in our explanations.)

Oh, here's a nice article from Nature [dead link] that you might find an interesting read. It might help make my "imagination + imagination" concept a little clearer for you.

EDIT: You might want to adjust your tone a little in future, to a more respectful one. Sometimes when we think we are not understood or say that someone else is ignorant, it is actually our own lack of understanding and our own ignorance that is own show. This can later turn out to be an embarrassment for the commenter - especially on a public forum like this.

POST: I'm so confused.

If you make a change, not everything changes. One analogy is like changing a TV channel, but it's maybe more like watching a different version of the same story. Most of it is the same, some changes.

POST: [deleted by user]

You are changing aspects of your experience through intention; you are not deleting yourself!

POST: Do you keep all previous knowledge when you jump?

I you lost all of your knowledge, you'd not know about it. If you made a dramatic "jump" and had no memory of it or what came before, it would just be everyday life for you...

Generally thought, the idea is to make changes and retain the memory of the act and of the prior state.

==So you could technically lose your knowledge? But in the example I used, e.g. worse test scores, which people say has actually happened, loss of knowledge wouldn't be a problem?

Well, it really depends on the details so it's hard to tell. You end up with worse test scores - are the tests now different to that you remember (knowledge is the same), or are the tests are the same (knowledge is correspondingly not available), or tests are the same but still can recall knowledge. All are possible really, right? You want to deliberately specify I suppose.

It's a neat thought experiment to think that we may lose our previous knowledge. We could be jumping all of the time but forgetting and we'd never know. Maybe we do jump all of the time and the key to dimensional jumping isn't to actually jump, but to take your memories with you.

We could be respawning a new world-pattern from scratch every morning, and we'd never know. Enjoy today, /u/Aeropro, because it's the only day you will have ever existed! ;-)

POST: I have a few questions

[POST]

Hello I have been a lurker of reddit for some time now and have finally decided to make an account. I will get straight to the point. I have been a sufferer of chronic halitosis for awhile now and it has affected my social life and who I've become. I want to know if it is possible for me to jump to a dimension where I don't suffer from halitosis. I have done everything possible to try and cure myself. I brush and Floss 3 days have tried countless of bad breath cure products, oil pulling and none that has worked. I don't remember the last time I have been genuinely happy.. I have ran out of ideas and feel like this could by my solution. Can I jump to a dimension where I don't suffer from this? If so how do I picture or say to myself what I want when I'm doing the mirror technique?

[END OF POST]

Hi, sorry to hear, that sounds a real pain. Stuff like that can really wear you down, I really sympathise. :-(

The answer is, yes, you can use these techniques for that sort of thing. You might want to begin by checking out a couple of things though. One problem is that if you are (understandably) focused on this and fighting it in certain ways, they can imply it and persist it. You can end up imagining the situation you are in, ever more deeply. In other words, you generally have to be careful to intend-imagine being in a good situation rather than not being in a bad situation.

Fancy doing a little experiment? Lie down on the floor, get quiet, and see if you can summon the what it would feel like to be a person with 'confident breath'? I don't mean any physical sensation of your body, but rather the "what would it feel like if this had been all sorted".

See what happens with that as a starting point.

Hello. Thanks for your kind words.. yes it is mentally painful I have psychologically scarred myself because of this.. Every time something rubs their nose or make a disgusted face.. I know they are doing that cos of me. There is nothing more in life that I want but to cure myself of this.. I have a job that I like and a wonderful family. It has affected me so much that I have thought about committing suicide. But I have long past that obstacle and learnt there is more to life. I've tried that experiment last night but I struggled to imagine what it would be like to have confident breath.. I kept getting images of me talking and people just rubbing their nose basically just negative thoughts. And what's even worse is there is this girl who likes me and I like her but I can't even take her out on a date because of my breath.. I don't know what to do.. do you have any tips?

That sounds so frustrating. I'm pleased you've realised it in context though (that's it's a nasty pin in an otherwise comfortable cushion). First, I'm going to give you some

practical advice: Get yourself some Neem toothpaste and mouthwash. It's magical stuff for keeping the mouth happy more generally, I've found, clearing up little flare-ups. Definitely worth a spin for you. Okay, stage two of the experiment. You've got the idea now: we're going to work towards you being able to generate the feeling of what it will be like when you're sorted... This time, you're going to do the same thing, but deliberately imagine situations where people smile and respond as they will when this is all fixed. The important thing here is that you imagine the situations as if looking through your own eyes, being there, having the experience. If the downer images you get are pretty much the same all the time, I want you to change those images into version where people are smiling, chatting, and you are responding, smiling chatting and relaxed. Again, we're looking for how it will feel when things are great. Okay?

Bonus paragraphs...

- Bonus 1: When you've done that, you are going to be more specific. You are going to imagine, as if it were happening, a situation with that nice girl which meant that this had already been sorted. Totally immerse yourself in and enjoy that imagining. Right?
- Bonus 2: There's something extra to be careful about here. When we have something we are unhappy or worried about, it's a fact that the world tends to confirm our fears. Not just confirmation bias, it tends to give us a little more than that. So I want you to be careful of looking out for signs that people are responding to your breath. Just decide to give up on that, and be okay with how you are now, for now - because it will change soon.
- Bonus 3: Maybe once you've got "the feel", you should ask the girl out anyway? And you're gonna recall the "vibe" you've developed doing the exercise. Try some neem, load up on mints if you need a crutch, then "fuck it!" and enjoy some fun. You'll regret it later if you don't. And if its doesn't work out... oh well, next time!

I have a gut feeling that this [impacted wisdom teeth] is the culprit.

Trust that feeling. There's "something" about wisdom teeth. I had massive problems with my wisdom teeth (your whole body responds to them being there, not just your mouth). I had a very powerful "intuition" about them ("get them removed now, TG!") before they ever caused a problem...

So I think you're definitely on the right track (booking to get them removed and assigning responsibility to them).

POST: New here, with questions.

The "dimensions" are metaphorical. It's a way of saying you can shift your experience from this configuration to that configuration. You are deciding to make a change, detaching from your current experience and allowing it to shift. The whole "decisions create alternative universes" thing is a bit overblown. A better way to say it is that all possible experiences are available, but your "next-moment" is normally limited by your current situation and expectations. "Jumping" is a way of loosening those limitations, so you can jump to a farther position on the Infinite Grid of All Possible Moments. All patterns of experience are there already, it's a case of traveling to them.

(Fundamentally, the universe has no "dimensions" - that's a structure our mind imposes. It's more like an "infinite gloop" of dimensionless facts, perhaps.)

See links in sidebar for techniques and metaphors.

POST: If you think dimensional jumping isn't real...

[POST]

Go prove it then. Go prove that what this sub reddit is based on isn't true. Try jumping. Just know that the whole mirror technique is just one technique. There are other techniques. Don't forgot to be very observant. Do more research. Be a bit more open-minded.

Oh and sorry if this doesn't belong here.

Edit: Such great discussions. Well I haven't done DM yet because I am... Not quite ready. Maybe when trouble arises I will try it.

[END OF POST]

Fine words of encouragement! The challenge has been set! :-)

I was kind of worried that this wasn't suppose to be here. I do hope people notice this.

You've captured the right attitude totally. The sidebar got updated a couple of days ago with basically the same thing:

NOTE

There is no established theory of "jumping" or its mechanism, although there are numerous ways of viewing its nature.

It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not.

An open mind combined with healthy caution is the correct mindset for all approaches targeted at the subjective experience.

Never believe something without personal evidence; never dismiss something without personal evidence.

If people aren't interested or don't care, that's totally fine. And nobody should believe something just because someone else says so (even if they like the idea). But this is a "personal experience" kinda thing so it can't be dismissed only because it sounds quirky.

...

http://en.wikipedia.org/wiki/Philosophic_burden_of_proof

In this case, the assertion being made is: "if a person does this thing, then the person will have this experience". Nobody can supply proof of that to the person, he must examine the matter for himself.

A3: All scientists must have a hypothesis and begin their experiments before the burden of proof can be established. That's what we're doing here; experimenting. That's fine if you don't want to try something before it's proven, but you won't be the kind of person who discovers anything new or interesting, unless its by accident.

I understand that. I read the title/first sentence, "If you think dimensional jumping isn't real...go prove that what this sub reddit is based on isn't true", as basically the same thing as someone saying that I can't prove that they don't have an invisible pet unicorn. The burden of proof lies in the person making the extraordinary claim (and I would classify jumping dimensions as extraordinary). If someone comes up with proof that dimensional jumping is real, then I will stop viewing this subreddit as simply a cool place to come to read neat stories.

A3: Being from the other side of the fence, I got a different meaning from those same words.

AFAIK there can be no proof for this phenomenon, by definition, outside your own experience. Knowing this, I read his statement not as an attempt to have you prove a negative (impossible, I know) and then present it to us all. I took it more as a challenge to suspend your disbelief and try it for yourself because at this point its all we can do.

Like /u/Aeropro, I read it the other way also. That this subreddit is based on a subjective experience, so you have to seek out the subjective experience in order to prove to yourself that there is no basis for the subreddit. It's fine to leave it open or to just not care, of course, but denying there is an effect just because we have no explanatory framework for it is meaningless. The notion of "dimensional jumping" is the driver for and a way to explain changes. Like any other "cause and effect" type story, it's a way of joining two experiences together to make it easier to "understand" (read: to repeat and leverage an apparent connection). Since we can't get behind the scenes, as it were, of this sort of phenomenon, you can't experience a mechanism behind the effect. (We never can, really, even in science, but at least there we are in the realm of shared observations, and so we can share a narrative fiction to go along with them.) So we make up one, subject to revision.

A1: I agree that the burden of proof is on those who claim it is real. But I also think it is a purely subjective experience. No one can experience your jump except for you, and you can't prove you have had that experience with anyone else. I have no interest in proving DM is real to anyone. I don't care if someone else believes or not. It doesn't affect me. If you are curious, then explore it. If you are not, then go away.

Q: I agree that the burden of proof is on those who claim it is real.
No, it is not. You can not prove a negative assertion. While I will attempt to say this with as much civility as possible, I have also noticed that pseudoskeptics regard their social acceptance of anyone who disagrees with them, as some sort of prize to be won, when it is not. Your acceptance of me is not required, and neither, for that matter, is your approval of my state of mental health. You are entirely welcome to consider me as being completely insane if you wish to do so; because compared with pseudoskepticism and scientism, I quite seriously consider insanity to be genuinely preferable.

I think the commenter was generally in favour though: as it's a subjective experience you can only prove it to yourself. You are very right about social acceptance though. I think it's part of a more general problem: that subjective experience is dismissed in general. Which is ironic, since that's all we have really, and "objective" experiences are merely subjective experiences which are simple enough to communicate by language (the are words for it), and regular enough that enough people will have experienced them in order to understand the content of what is being said.

[COMMENT]

A1: I think it's part of a more general problem: that subjective experience is dismissed in general.

A big part of the problem with pseudoskeptics, is that when they say they require proof, they usually aren't even explicit in their own minds about the type of proof they want. What they really want is physical proof that has been mechanically derived, because they don't believe in anything other than physical reality, and they have also been taught by psychiatry to believe that empiricism that is not mechanically mediated is inherently untrustworthy. This again, is a logical travesty however, since as you yourself point out, ultimately our direct physical senses are all we have, even when a machine gives us a readout about something. If a pseudoskeptic claims that something does not or can not exist, then the burden of proof is with them, for the reason that disproving a negative assertion is not possible; which in turn automatically means that their argument is invalid. If they say they require proof, then they need to be able to explicitly specify the type of proof they need. Again, I am still under no obligation to provide them with any. My only responsibility to them is entirely dependent on whether or not I want their acceptance, and in most cases I do not. Logic is only empowering in the hands of those who actually know how to use it. The thinking of pseudoskeptics is neither logical nor empowering; it is merely a mental cage for them to sit within, and keep repeating to themselves that nothing exists. Their interpretation of science is almost exclusively about negative assertions, you will notice; what supposedly does not exist, or what can not be done. The entire reason why a negative assertion is not provable, is because the subject of such an assertion itself does not exist. In the context of logic gates, a NOT gate or inverter is defined by the absence of current. This is medieval logic, and it is provably sound. I am a magician, not a scientist. I remain convinced that the Enlightenment was actually the direct opposite. I have been taught how to think by the likes of Paracelsus and Agrippa, and by my experience with both computer programming and magick. Paracelsus was rejected by mainstream thinkers in his own time, just as I am in mine. I like to think that he and I have a fair amount in common. The scoffers of his day accused him of unspeakable arrogance; but even if it was, it was not unfounded. When he referred to his critics as fools, he was able to demonstrate that they were. I am also an empiricist before I am a rationalist. That means that if I attempt to perform a given dimensional jumping experiment, and my own results are consistent with the honest testimony of others, then I assume that the phenomenon in question exists; and I do so even if I do not initially understand the principles at work which generated the experiences. That is to be worked out over the course of repeated experiments. Magick is first and foremost exploratory in nature, and in fact specifically assumes and allows for initial ignorance and lack of understanding. I will leave it to the scientists to carry the ball and chain of complete certainty. It is far too heavy and restrictive for my tastes. "You are not yet blessed, if the multitude does not laugh at you." - Seneca de Moribus.

[END OF COMMENT]

An excellent assessment. I too am "an empiricist before I am a rationalist". Subjective experience is primary, connective fictions (explanatory frameworks) are secondary, but useful and perhaps in some sense causal. The main-push physicists of the early-mid 20th century were not at all like most physicists and scientists today (who are effectively "engineers with beliefs"). They knew exactly the nature of what they were doing (modelling observed regularities, not uncovering truth). Some still do - e.g. George Ellis here [\[https://www.scientificamerican.com/blog/cross-check/physicist-george-ellis-knocks-physicists-for-knocking-philosophy-falsification-free-will/\]](https://www.scientificamerican.com/blog/cross-check/physicist-george-ellis-knocks-physicists-for-knocking-philosophy-falsification-free-will/) and here [\[https://www.nature.com/articles/516321a\]](https://www.nature.com/articles/516321a) and there are many others. As their points are more subtle, and less attractive to funding and to the popular "gee whiz!" media, they tend to get less coverage unfortunately.

Related, I was reading an article [\[https://www.sheldrake.org/reactions/the-anti-sheldrake-phenomenon\]](https://www.sheldrake.org/reactions/the-anti-sheldrake-phenomenon) the other day, about the aggressive responses to Rupert Sheldrake's (morphic resonance) work, particularly by super-skeptic Michael Shermer. It's worth a read. (Sheldrake's morphic field ideas are very close to physicist David Bohm's implicate/explicate order, but because Sheldrake is inevitably closer to "everyday life" as a biologist, he got a kick-in.)

It then so happens that there is a moderated dialogue taking place [\[https://thebestschools.org/sheldrake-shermer-materialism-science-replies/\]](https://thebestschools.org/sheldrake-shermer-materialism-science-replies/) over these few months between Shermer and Sheldrake. Interesting to read reader's comments as much as it is to read the main participants contributions.

"It only works if you believe"

It's actually not about belief - or only in the sense that, you have to fully commit to it while you are doing it, because deliberate or implied intention is a requirement. The sidebar already describes the appropriate mindset.

You have cleverly chosen a phenomenon which can't be duplicated, recorded, or proven in any way.

The point isn't to prove anything to a third party, of course. And you're right: if the world-pattern moves self-consistently, there can be no trace of the previous state except in memory. How convenient! But in both senses!

The technique, being about shifting your own experience going forwards, is indeed subjective - and what else is there, after all? Conscious experience is entirely subjective: try proving that you are conscious or have thoughts, other than to yourself...

The assertion being made is:

"If a person does this thing, then the person will have this experience".
"Nobody can supply proof of that to the person, he must examine the matter for himself."

But nobody cares if you do it or not. However if you don't, you can't reasonably make a comment on whether an effect occurs, nor comment on the nature of that effect.

you should include a disclaimer in the sidebar stating that dimensional jumping is purely a thought exercise and in no way affects the 'shifting nature of reality'.

The problem is - it does do something that shifts your experience of reality, if you try it. What the nature of that change is, is up for debate. There is no mechanism, other than the experiencing.

Essentially, detaching from your senses and using a metaphor to conceptualise a change with intention results in a change in subsequent perception. But not just in the "values" of your perception; it apparently affects the "facts" also. Which is why it's an interesting area to explore, and potentially useful too.

EDIT:

Preface

I'll preface this with, nobody is telling anyone what to think here. Your response seems to be based on that idea, and the idea that other people can't be trusted to bring their own judgement to bear on things. You should always be the authority of you.

Historically, those who promote a position (politically, scientifically, historically) have always turned out to be partially incorrect at least.

Acceptance should always be provisional, in matters you have not or cannot personally verify, and all explanations should be treated as useful, not "true", since even the most apparently robust worldviews shift regularly as additional observations are incorporated - usually after a lot of in-fighting rather than an organised transition.

Response

False. By having this discussion right now I have proven my sapient self.

To yourself.

Everytime I drop the weight and observe it, it will be the same, and everytime you drop it, it will be the same and if we compare notes our numbers will match. This is not a subjective experience.

Of course it's a subjective experience. That isn't to say we can't have subjective experiences that, through communication, we subsequently agree are identical in the key respects. Of course we do!

That experiences are subjective doesn't rule out intersubjective agreement. In fact, this is exactly what science is: identifying the subset of experiences for which there is intersubjective agreement, and producing descriptions in language which can be agreed upon. However, it is probably the case that, beyond very common regularities, most experiences cannot be agreed upon in this way.

Again, your claim boils down to "You can't prove that it isn't real unless you do it. And if someone does it and experiences no change your answers will always be...

No, those won't be the answers. As I said, nobody is saying anything other than: I've done this and had this experience, try it out for fun. If someone doesn't get a result, then it didn't work as far as they are concerned. Case closed.

In that regard I can say I did it and before, everyone on earth had three eyes and now they only have two. You can't prove my claim wrong, and I can never prove it right.

Who's claiming anything or proving anything other than to themselves?

Now, if there are many accounts of an effect, then that may encourage others to give it a go - but until they do so, they shouldn't believe anything. Nor disbelieve it really, just leave it open, but that's entirely up to them. Fine to say "that doesn't make sense to me, what rubbish!" if they like, particularly since intersubjective agreement is inherently a problem with this phenomenon.

You are stating a belief as fact. Because what you claim is, by it's design' impossible to prove, you cannot state it as fact.

Nobody is promoting a general position, they are reporting their experience - describing the process; describing the subsequent experience. Actually, I usually say "apparently results in". The thing is though, there is no difference between saying "apparently results in a change in perception" and "actually results in a change in a perception". How does one distinguish between an "apparent experience" and an "actual experience"?

The reason "facts" is in quotes, is to avoid asserting a change in some external world beyond perception, about which nothing can ever be said.

Is a less harmful statement (but still deluded).

But your modified statement is incorrect, because you are responding to a position nobody is taking. In context, the statement I made isn't a "position" or a statement of fact, it's a report of an experience. If I were to make a change to clarify things for you, it would be to preface it with "People have found that..."

We might compare this with, say, lucid dreaming. If I say that I have the experience of being conscious in my dreams, it makes no sense to make me add "I think that" or "I believe that" I have the experience. That would be like me telling you are you are not conscious, you simply think that or believe that you are conscious!

...

A2: *because compared with pseudoskepticism and scientism, I quite seriously consider insanity to be genuinely preferable*
lol

POST: Is there any non-anecdotal evidence for jumping success?

Well, it's important to realise that no consciousnesses are exchanged and there's aren't parallel universes in the sense of spatially-extended places. You aren't really swapping places with anyone. (Aside: MWI in physics is a pretty crappy philosophical interpretation of a mathematical theory and is not very well regarded, even though it gets a lot of coverage in "popular science".)

These descriptions are "active metaphors" - ways of conceiving of dramatic changes in your experience, and subsequently triggering them. They offer a way of changing your "world-pattern" by loosening your hold on it, and intending a shift.

You might view this as triggering shifts similar to the spontaneous experiences reported in /r/Glitch_in_the_Matrix. As with those stories, often the only evidence is the memory of those involved. Why?

Inherently, there can't be any "objective" evidence - at best, only intersubjective agreement by a few participants. If the state of the whole world changes, there is no residual evidence of how it was before. The world-pattern remains inherently self-consistent. In fact, that may be the only rule.

If there's a bit of physics to support this, it's Wheeler's "Delayed Choice Experiment" - from which you would conclude that only observations are important, and the story we describe of what happens between observations is an imaginary "explanatory fiction". (See my comment here [https://old.reddit.com/r/Glitch_in_the_Matrix/comments/37ylzn/theory_scientists_able_to_make_the_present/crqvcad/] to a post about that experiment.)

Wheeler himself was of the view that the "universe" was basically dimensionless information which accumulated and become more defined with each observation. In other words: each observation defines a "fact" which constrains what might be seen in subsequent observations.

Relevance to "Dimensional Jumping"? Well, "jumping" is a way to reset the accumulated observations to a certain level. Some of the key points:

- There is no world behind the scenes, beyond our experiences.
- All explanatory schemes are fictional.
- The pattern of your mind = the pattern of your world.
- "Dimensional Jumping" is a way to shift that world-pattern.
- The "one rule" means that after a shift all subsequent observations will be self-consistent. In other words, you will never encounter evidence of the previous world-state other than your own memories. (And you cannot guarantee those, necessarily.)

TL;DR: It's inherently an anecdotal phenomenon although it can be an apparent multi-person experience.

POST: Intended to attempt dimensional jumping and wound discovering something completely different called Mirror Tratak

At the bottom of the Darkroom Vision post there's a link to a "stranger in the mirror" article. There are loads of comments under that which are pretty interesting.

Random comment:

I never tried this with a mirror, but the effect is all to familiar. Me and my girlfriend 20 years ago would stare into each others eyes for long moments. Ah, the good old times. On several occasions, starting at the exact same moment for the both of us, this illusion started. A rapid series of faces of young and old people would start. While it felt uneasy and erie to me, it scared the hell out of my girlfriend, who is a believer of afterlives and reincarnation. She believed those were the faces of people we

once were. To me, the strangest fact was that this effect would start and stop at the exact same moment for the both of us, and that it has never happened that she or me saw the faces while the other did not.

Also, after it happened a few times, we began to recognize the faces and their order, but this felt so bad that we looked away for a second as soon as it happened. It isn't a pleasant feeling, so we started to avoid it.

I do not think my room was as dark as suggested above. I seem to recall this happened in the daytime too.

-- Dave, Posted September 18, 2010 at 7:47 pm, The strange-face-in-the-mirror illusion

POST: Would this be too big of a jump...

[POST]

Hi, I'm haven't "jumped" (that I was consciously aware of) before.. I've been learning meditation and reading self-help books, I am at a point where I am quite present the majority of times, I understand my existence and so finding this sub and it's contents was no surprise to me--nothing I wasn't aware of. I've been focusing on the Law of Attraction & reality shaping/creating etc, envisioning how I'd feel if I already had everything i dream of & feeling it. I have some form of IBS or Candida... Whatever, basically I currently have a messed up stomach/bowel system in which I have pretty much all the negative effects you could think of. I've spent years wrestling with medicine, diets, homeopathy, even started making my own fermented foods. I can't find anything to fix the issue, it's affected every aspect of this "life", I act as if its not there & adopt a positive mindset, but it is still always there in the background. Wondering if it'd be wise to attempt "jumping" to an experience in which I have found the correct treatment methods and skipped all the bullshit. Like, I actually found a medicine combination that cured me & I could go about life without this controlling me. Do you think this is too big a jump? Should I start small? Or should I continue practicing to manifest a reality in-which this no longer exists in my experience.. This is quite long as full of rambling about things you couldn't care less about, but I feel as if I'm close to an answer and a fix to my problem, I am yet to find the path. Cheers....

[END OF POST]

You might check whether you are directly interacting with your experience or whether you are thinking-about things, when you are working on this. Are you picturing a future situation "in your head", or are you overlaying that situation over your 3d-sensory experience right now, as if it were actually happening?

This is the difference between fantasising about something vs creating an "observation". What you want to do is create an observation which implies that the situation your desire is a fact. You might also experiment with placing your attention in your stomach/bowel area (again, not thinking this, but actually mentally sitting with that region in space) and just feel out what's actually there; sit with it. See if there's any information - "stuck thoughts" or "incomplete movements" (no pun intended!) there.

More aggressively, you could include that area in your attention and directly will a better feeling in its place. Basically, directly overwrite that area of your experience. The trick to this is to "go looking for" the desired feeling, in that location - as if it were already there, and simply needed discovered.

I thought I was doing this.. Treating it as if it was actually happening in reality. But as I said, the problem remains, lurking in the background. Maybe I'm just not doing it right :/

Try "asking" it what the problem is? Just sit quietly, rest your attention there and wait - and "let it speak".

My other thought more generally: Are you taking time out to detach and relax when doing this? Summoning things via imagination should be effortless. You can't force it, because you need it to naturally become part of your "world-pattern".

Maybe I'm just so used to this reality that it'll be a long process unlearning? If you get what I'm saying.

I do. These things are like "habits-of-the-world" really. Sometimes it's difficult to break them, because they are so intertwined with other parts of our world that they keep getting re-triggered. You have to let go and stay let-go.

That's why "technology" can be useful:

Rather than saying "I have the power to heal myself" - which can be hard to commit to if you don't really believe you are your experience - you instead "outsource" it to another part of the world. You say "this object or action has the power to heal me" and then let that play out. So don't be afraid to use other routes. And just because diet and drugs aren't "real" doesn't mean they don't and can't have an effect. They are established aspects of your dream, as it were. It can be easier to flow with them rather than de-pattern the whole of your reality. However, the intention you attach to these 'magical objects' is important.

Remember, habits are a good thing: Without habits, you'd have to manually create and maintain everything constantly. Objects would fade in and out, nothing would be stable. A bit like when you start lucid dreaming (if you've done that) and you're not very good at maintaining concentration.

Example: There is no reason why you can't survive being hit by a truck. However, "solidity" is a very strong habit of your world, and the experience of "being hit by a truck" tends to be followed by the experience of "being mangled pretty bad". On the upside though, you don't have to constantly focus on not falling through the ground due to being mildly distracted and forgetting to enforce "solidity".

When you say overlay the situation, do you mean sort of role play as if you are already what you want? Am I wrong in thinking that dimension jumping is a lot like manifestation?

Yep, I'd suggest that manifestation and jumping are both just ways of saying: "Changing this sensory experience to a sensory experience that I want". It's just that the metaphors are different. When I say overlay, I don't quite mean role play (depending on what you mean by it).

Conceive of it as literally replacing the sensory experience you are having now, by superimposing one that would mean you were in the situation you want while intending that this happen. Without the intention, it's just messing around with role play. With commitment and intention and full imagination, it's basically changing the patterning of your world. The experience you are having now is imagination, solidified. Imagery with momentum, you might say. Detaching and intending is a way of moving from this experiential imagery to that experiential imagery.

By role play I mean I act as if I have that life already. I make my decisions based off what the version of me in that life would do. This sounds a bit silly, but I even have a scrapbook of it. I collect photos of my ideal from magazines and paste them as of they were moments in my life. Then I browse these clippings from time to time. It helps "set" my mind and intentions.

Act "as if it were already true". I've never done it quite like that, but that's a great approach for getting more immersed in it - visions boards and scrapbooks. I've played with certain acting techniques to help with "embodied imagination".

POST: Dead celebrity?

"Daydreaming" is detaching and is basically the first step of this stuff. (The other part is deliberately directing it; knowingly intending a particular change.)

I think whenever we "let go", a little bit of realignment of your world takes place. It just loosens the influence of previous observations and allows things to settle a little in correspondence with how your are feeling and thinking at that time. This has a "pulling" effect on the whole "world-pattern" though, so apparently-distanct facts can drift a little, go a little fuzzy; you end up re-establishing them on your next encounter. (See recent related comment here on that. [Following post on this compedium...])

POST: Got a little question

[POST]

I'm planning to jump soon but when i read how this works. This question is related to the Schröders Cat: The cat has 2 states: Dead and alive. Only as Long as we don't open the box/see it or saw her living So and now when i jump but i think of something that i want to Change, i'm thinking about. So it can't actually Change because i saw that thing and know how it is and im thinking about it. Am I wrong or got i misguided?

[END OF POST]

Well, "Dimensional Jumping" is about updating the current facts of your world, by detaching enough from your experience so they can shift to a greater or lesser extent. It is the approach designed to make the change you describe. You can certainly use it to decide the state of the cat before opening the box. But more interestingly, you can potentially use it to change the state of the cat after it has been observed.

In more detail:

Everyday Life Mode

You might say that your world or "world-pattern" is the sum of all the "facts" you have observed. Every observation further narrows the set of subsequent observations which are possible. The world-pattern can adopt any form, but because it is a continuous pattern there is one rule that normally applies:

- The only rule is that the world-pattern is always self-consistent.

In other words, the world always "makes sense". We might call this process Observation Accumulation and we might call the rule The Law of Coherence.

The proper interpretation of Schrödinger's Cat is that it has no state unless it is observed. Nothing ever "happens" unless it is seen to have happened, by observing it or by observing something which implies it. But once an observation is made, that observation adds another fact to your world-pattern, and from that point on all subsequent observations will be consistent with that new fact.

Normally we just let the world-pattern unfold and evolve spontaneously, without manipulation. Each observation follows from the last, without us directing it, and we only intend actions which are consistent with what we observe. In "Everyday Life Mode", our observations appear to us, arising naturally from the current state of the world-pattern as it evolves and unfolds.

Dimensional Jumping Mode

In contrast, "Dimensional Jumping" is the process by which we deliberately add additional observations (assert new facts) into the world-pattern, using our intention and imagination - observations which do not necessarily follow from our present experience, and can even be contrary to and overwrite existing facts. We disrupt the part of the world-pattern and shift it to a new state. When we do so, The Law of Coherence means that the world-pattern will shift as one interconnected shape, so the new state will "make sense". This inevitably means that other facts are pulled out of place as a result of our change.

- If the world-pattern is shifted, all subsequent observations will be consistent with the new state.

Metaphorically speaking, if the cat had been observed to be dead and we "re-observe it" to be alive, then from that point onwards all observations, all subsequent experiences, will be based on the cat always having been alive. This may include the experience of retrieving a memory about the cat.

Note that immediately following a change, there might be a transitional period where the world-pattern is settling out, and inconsistencies or confusion may linger. The extent of this will depend on how detached you are, whether you are holding onto and resisting the movement of some aspects of the world.

TL;DR: It's all about creating new observations (sensory experiences) which imply that your desired situation is a fact - generating an experience which means to you that something is true.

POST: [META] I'd like to suggest that not all jumps are preferable, and that to the extent you believe in this phenomenon you should be respectful of its power and prayerful in its application.

This. It says right there in the Tesseract Working that this is akin to suicide. The fly by night way some approach the idea of jumping betrayed their immaturity towards responsible magick

It shifts your world including your experience of "you", so it's good to be cautious. It's an effective suicide in that the "you" that you are experiencing will shift more discontinuously than is usual. Having said that, most people are unwittingly do a version of this quite frequently - but they are just oblivious to it because their world is remaining self-consistent. The problem with the mirror method and the tesseract approach is that they present a ritual which is by default "undirected". Since most people don't understand what "intention" is (even if they imagine something, they'll often not will it to give it context) even directing it is a little haphazard. That's why I think Neville Goddard style approaches or pattern-triggering are problem better, because you are more conscious of an "act" taking place, and you already have a direction in mind. A problem with all magickal dabbling is that people tend to not believe it, or believe that belief is necessary, and so mess around - and then get actual results whether they realise the connection or not.

Fortunately, basic mirror-staring is unlikely to cause problems; it's most likely simply to accelerate the path you are already hurtling along.

POST: About dimension jumping..

[POST]

So...a long time back, I lost a couple of friends. No, their not dead. We just had a big fight. I was wondering... Is there a way to jump into a dimension where I didn't ever get in a fight with them?

[END OF POST]

AI: It would be easier to jump to where you have all forgiven each other. Whereas it is possible to jump to where the fight never happened, it would require identifying and letting go of a larger, indeed much larger, set of beliefs.

Q: What do you mean by 'set of beilfes? And I would prefer to the fight never happened..but what about...jumping to one where I never met a certain person? If I didn't meet that person...the fight wouldn't have happened..

AI: This explanation might diverge from the consensus here, but I have evidence to make a strong case for it. Reality is inside out. What you see is what you project. What you project is formed from what is within. In order to change what you see out there you must change what is within. You are contemplating a big jump. To go to where you never met someone you would have to let go of everything that you're holding onto about that person. You'd let go of every emotion and every belief about that person. Furthermore, you'd likely have to let go of beliefs that you hold about your friends' opinions about that person. Unless you can identify one core belief that unravels all of the other thoughtforms... Maybe there is a core belief that led you to that meeting that would unravel it all. However, the connections of that core to all of the other related beliefs could disentangle other connections, which is where you run into unintended consequences that you don't want. It would be so much easier to find that place of forgiveness.

You make a good point. The problem with massive changes is that, because your "world-pattern" (by which I mean the set of all current facts) is a single continuous thing, tugging on one part of it inevitably leads to shifts elsewhere - shifts that may make no logical sense and are hard to anticipate.

A metaphor - Imagine you have a large expanse of material, formed into a hilly landscape with a different shaped object on top of each hill. The shape of the object is the current state of that region of the landscape (the current "fact"), and the hill represents the history of that that object.

- If you change the shape of the object (from pain to forgiveness) that is just an additional change in the ongoing development of the region. The region will evolve a little and will affect other parts of the landscape, but it will be a harmonious shift.
- If instead you work to change the hill (the history) then you are also tugging on the rest of the landscape - thereby changing the histories and positions of other objects discontinuously, in complex ways that cannot be predicted.

POST: [Theory] The Mirror Method Is Just Another Metaphor for the Dimension Jumping Metaphor; A More Direct Approach to Shifting Reality

[POST]

The mirror method puts the reality shifting process outside oneself. Bring the process back to the Source within yourself, and it makes the transition easier and with less chance of unintended consequences. Back in late May I decided to try the mirror method. Over a few days I jumped a few times with pretty good results, though I had very little somatic feedback to signal that I had jumped. My intentions weren't for external changes. My intentions were for internal changes. My intention for one of the first jumps was to know that I could shift reality. I intended to be a master jumper. In the days following, I started to see a lot of synchronicity. At first it was surprising to see my thoughts reflected in reality. It was so accurate that I ruled out the possibility of confirmation bias. I chronicled some of the events at /r/Glitch_In_The_Matrix. However, the results were better with spontaneous thought than with intentional thought. I wanted to know why, so I took the red pill and went down the rabbit hole. My search revealed many metaphors and ways of saying the exact same thing, that reality is inside out. My mission was to find the most direct approach to change what is within in order to change what is projected without. After looking at the many different layers that I found in the Library of Babbling On, I was repeatedly drawn to the Ho'oponono prison story. It reveals a very direct approach to shifting reality, cutting out all of the nonsense and mumbo jumbo that is heaped onto the process of what is very simple.

- Take responsibility for everything that you experience.
- Identify the experience that you want to change, and find it within yourself.
- Let go of the experience by/thereby letting go of that within you that projected the experience outward.

"I'm sorry. Please forgive me. Thank you. I love you." - Ho'oponono Prayer.

The incantation effects the following:

- Apologizing recognizes responsibility.
- Asking for forgiveness lets it go.
- Gratitude accepts the change.
- Love for oneself (since the reflection is from within) sets the right tone to accept that change.

Last night, I thought of a friend's pain, and I took the aforementioned action. It took very little time, compared to the mirror method. The somatic feedback, like a cool breeze within my chest, was immediate and very strong. This morning when I woke up, I felt a hot tingling over my entire scalp. I feel the change. We'll see what the Universe shows me next. It could also be done with one's own reflection in a mirror. Be the change that you want to see, whether you jump with a mirror or without one.

Edit: typo

[END OF POST]

Agreed. It's all "active metaphors", as it's phrased in the sidebar. They are all different ways of indirect creation and amendment in what amounts to an imagined world. Remember that even with the mirror method, you are dealing with something that is within you; the so-called "mirror" is inside your experience. Real mirrors are actually just very stable ideas of mirrors. So in the mirror method you are declaring that "mirrors" have the property of allowing jumps - and so they do. Equally, you could declare that visualising a desire in detail "inserts it into the universe" and so it will come to pass. And so it does. Or perhaps there is a bad situation, and you bring forth a thought about it. Implicitly in doing so, you are recognising that this thought is the situation. By updating the "bad feeling" into a "good feeling" you are literally changing that situation. (This is the Ho'oponono approach.)

In all cases, the implicit truth is that everything in experience is basically objects made from imagination. To imagine-that you are doing something is to actually be doing that something - subject to the other things you have imagined to date. You can have a lot of fun experimenting with this. Random example: take two glasses, one filled with water, one empty. Declare that the empty glass is you and that the other glass is the world. The water is an experience you desire. Now, pour the water from the world-glass into the you-glass knowing that you are pouring your desire from the world into your personal experience. To "reprint" something from before:

"However you imagine that it works, That's how it works." -- The rule of metaphor

*Q: I like how you think. Yes, you are correct that the mirror is inside my experience.
I tried the mirror method several times, and I kept a private journal. I had a few difficulties with the method:

- very little somatic feedback -- these sessions averaged about 40 minutes long;
 - difficulty with visualizing -- though I seem to imagine my world quite well;
 - difficulty accessing emotion.
- The Ho'oponono approach as I used it required no visualization but provided instant access to emotion and provided nearly instant somatic feedback that it had been accomplished.
- Of course, the access to emotion was attached to my repentance for my responsibility for projecting a hardship for my friend, so it was more emotional than intending to jump with a mirror to improve my ability to jump. However, I could have accomplished the same by taking responsibility for my friend's not having the power to resolve her loneliness because I had accepted that I was powerless to shift my own reality.
- Instead of saying this method is easier, let's simply offer it as another technique and list the pros and cons. For someone who has strong visualization skills and easy emotional access the mirror method might be more suitable. Someone like me with strong empathetic triggering of emotion and lesser visualization skills this method would be more suitable.*

Yeah, the word "visualization" is a bit of a problem I guess, because it implies an actual visual. Maybe the word "shadow-sensory imagery" is better. Anyway, the main point is that doesn't have to be visual, just summoning a sensory aspect of any sort is sufficient. Even just the feeling-idea of something. What it's important is that the experience you summon is viewed as actually being the thing your are trying to access and change.

So if I think of my (say) friend in trouble. That thought is that situation, and having accessed that thought I may allow it deepen and become clearer, and then adjust it accordingly.

The "full responsibility" part is really just a recognition that you are experiencing your own "private view" and that everything in your apparent world is you. Things are not your fault but they are literally aspects of you. So if you want them to change you must do so yourself, either indirectly via second cause ("causing" an email to your sister which apologies for the trouble you caused at the wedding) or directly via first cause (accessing the "sister relationship" directly in your mind and modifying it). Both are actually first cause, of course, because that's all there is.

[On the complexity and detail of the mirror method]. Is it not a bit too complicated for what you might do with two glasses and some water?

You might do it with two glasses of water, but how many everyday people are going to take it seriously and actually declare that the glasses and water literally are that situation?

The pomp and ceremony of the mirror method ritual and its opacity to logic are beneficial for getting people to anticipate that something valid is going on. Mirrors do have that "other dimension" vibe and setting things up to be a bit scary and detached from normal experience really helps commitment - the implicit declaration that this ritual corresponds to dramatic change. The other methods listed (subjective imagination, tesseract magick, re-patterning) are more direct but people do like to feel they are performing an action before they will commit to change. The main problem is that we can't actually experience willing or intending, we can only experience the result. So folk tend to want to "do" something that they can call "the act", even though that is a result too.

Of course, fault is a loaded word, and I don't recall using the word.

No, you didn't use the word "fault". It was me using it preemptively (for those who might read) because it's often the first thing people think of when it comes to the notion of being responsible for the world - rather than getting the "it's all you" interpretation.

EDIT: I forgot to add: thanks for the thoughtful post, it was a well-written read!

It all boils down to building and accepting a model that allows a space for your intentions to work. Different strokes for different folks. You are welcome. Thank you for your thoughtful feedback. I always enjoy reading your thoughts.

Yes. And the models you make are made from the same stuff as the experiences you are having. Really, a model is just another experience, another observation which you've "decided" means this. It really is all about ascribing meaning to things.

Responsibility=Response Ability

Cute!

I agree. I think that is where religions went wrong, when people started treating abstract and symbolic ideals too literally, and the ideas behind symbols went dead. The same with the mirror - it doesn't matter what kind of candle you use :-P you can invent your own ritual entirely, it is the spirit of the whole thing that counts.

Although those electronic candles are a poor choice, simply for elegance of design. They are the Comic Sans of the illumination world and the God Of Dimensional Jumping will surely look upon their use poorly! ;-)

POST: To answer a few very common newbie questions. The name "dimensional jumping" doesn't really describe it well.

Calling it "dimensional jumping" confuses a lot of people. It makes them think that they are jumping to an alternate dimension. It is just you making an alteration in your perception of how you perceive your reality.

Although I'd add: using words like "reality" is problematic also, though. What does it mean to "perceive your reality" and change that? Those terms are quite loaded. The problem with the term "dimensional jumping" isn't necessarily with the words, it's the assumptions that are brought to the words. Assumptions about what "you" are and what "the world" is, in the first place. So although the name can be a source of misunderstanding (because it has associations with science-fiction type imagery), the process of unpacking that misunderstanding can be very useful - because it reveals that there is perhaps a much wider misunderstanding underlying that one.

You aren't going anywhere.

But then, in what sense are you really ever anywhere anyway? And so on. Ultimately, it might turn out that the distinction being made between literally changing dimensions and metaphorically changing dimensions is not a meaningful one - that they are, in their essential natures, identical

This is a really good point too. I really enjoy trying to wrap my head around it. I was wrong. Thanks for disagreeing with me. I enjoy being in the wrong in this type of scenario. Honestly right now i'm probably typing a really stupid reply to you. I have just come down from vyvanse, and i'm all jumbled. I think that i'm going to delete my post. Or maybe i should keep it up, so others can see your comment. Yeah i'll just leave it up.

No, definitely don't delete the post. It's a good starting point for a discussion. It's not that you are "in the wrong", it's that there are multiple ways to consider things, some of which may be more or less useful for one's purpose. Our eventual aim should (perhaps) be to be able to take the "meta" position: that is, to consider different interpretations as relatively true while being held, but recognise that from a fundamental position those are just "as if" positions. (Of course, this is a conclusion we would arrive at via personal investigation; it is not something to 'believe in'.)

This is where the literal vs metaphorical argument comes in. If you are having experiences "as if" something is true - that is, consistent with a particular metaphor - then it is, surely, indistinguishable from being literally true. We are then left to ponder what is the "nature of experiencing" itself.

I've a question that could be slightly off topic. Let's say you use "Dimensional Jumping" In order to "manifest" a girlfriend/boyfriend that is just perfect for you. Is that person a sentient being? or is that person merely an appearance arising within your awareness?

That's exactly on topic, I think. So, the place I'd probably start is, to pause and work out if and in what exact sense you are a "sentient being". (And also perhaps ponder why you used the word "merely" in your description.)

Wow, for some reason, I knew this is exactly what you would say. This reminds me of a dream I had. I was having this "serious" conversation with one of my dream characters, when I suddenly realized that he wasn't "real." Realizing this made me a bit fearful and even angry, and I lashed out saying "you're not even real!." He disappeared and I woke up. But, the funny thing is that, since I was dreaming, from the perspective of the waking-state "reality," I was not "real" either, yet I was accusing the dream character of being unreal. If I were to guess, when we manifest perfect mates, I'd say they're just as "real" as we are. But then other questions come up. Such as, does this person has an actual history, in the same way we have a history? Your thoughts probably differ here. But, let's say the "soul" concept is true, and that we've had many lifetimes. By manifesting a perfect mate, does that person also has a history stretching back countless of lifetimes? Interesting questions.

Ah, good example. So, that leads to the idea that you could "wake up" out of this current experience, and then you'd have to recontextualise this life. However, it's worth considering that you don't wake up out of anything, as such - there is no hierarchy, and hierarchies are just one way of thinking about the experience. Rather, your actual experience remains at the same level, it merely changes discontinuously.

As regards your "actual history" - in what way do you have such a thing? Your actual experience is, to occasionally have thoughts about an apparent history - in the ongoing now. If you recall a "past life", it could be the experience of "remembering something", it needn't have "really happened", and so on. Your state could change at any moment, into a state where you had a particular set of multiple lives, and then change again in an instant to apparently having had another particular set. You get the idea. "Souls" and "histories", too, are ways of thinking about experiences, perhaps.

However, we can short-circuit all of that, I would say. We might contemplate, if we are going with the "soul" idea: is the soul inside a world, or is the experience of an apparent world arising within the soul. (Here, I'm going to define "soul" as something like that-which-is-aware.) Without resolving that, it's very hard to talk about "other people", because we've not yet addressed in what sense we are "a person".

Could this be another way of saying, that, all "realities" are equally real, or unreal?

Or - that all moments of experience are of the same nature, and it's only the narratives we apply to them that organise them in terms of a hierarchy, and so on. We experience this moment then this moment then this moment (is one way to describe it); it's only our stories that label one moment as "real" and another as "dream".

We do evolve into higher and higher states of consciousness?

Well, I'd be inclined to say that all patterns and states are pre-existing, and we simply adopt them. In the same way as we might associatively flip through our memories, so we might flip through "moments". The story of "higher states" is similar to the story of "progress" in society. Really, things change, with notions of progress or improvement being a parallel narrative, I think. If all moments are available always, then any moment can be brought into experience at any "time" (because "awareness" is "before" time), which means there is no necessary development - although "associative traversal" of moments might tend towards an experience of apparent continuous evolution of some sort.

as a conscious entity...

Are you a "conscious entity", though? It might seem pedantic, but it's important to be clear about the nature of this experience. If what you are is, for example, an "awareness" whose only inherent property is being-aware, and which "takes on the shape of" experiential states, resulting in experiences "as if" the dominant fact-patterns that constitute those states are true - then "being a conscious entity" is a formatting of your experience, not what you are. What you are in that case is not an object, hence not an entity, at all. There is not actually "one" of you - because what you are is "before" division and multiplicity - and therefore there cannot be more than one "awareness" either, not fundamentally. There is just... "awareness". Which cannot evolve, really. However, it can certainly "take on the shape of" the experience of apparently evolving. But equally it could just adopt, on a whim, the state of being at any point of such an apparent evolution!

And, actually, for several years, this fear of solipsism has bothered "me."

That's a key point, actually: people often push back against anything that has a hint of solipsism about it, because they don't like the idea that there's "only me" or everything is in "my" mind. However, we are not talking about "my" mind at all, because "awareness" isn't a container or a thing. This is where we get into problems due to language, though. The very fact of using a word suggests an object, meaning we are "already wrong" (the "awareness" that can be spoken of is not the true awareness, to paraphrase). Language and conceptual thinking are already "too late", because they are experiences which are dependent upon the formatting of experience into objects, which are then related in mental space. It is not possible to think about, or have an experience of, that which experiences are "made from". That would be like trying to build a sandcastle which is the shape of both "sand" and "the beach". The sandcastle is both sand and the beach, but it cannot capture those things in form. All of which suggests that, say, seeking "enlightenment" in experiences is pointless - because all "enlightenment experiences" are simply more experiences. You always are your nature; it is not something you can find or think about. However, you can infer this by noting the content of your experience directly, and how the only thing than never changes is the fact of being-aware - that is, a permanent contentless truth.

This is, oddly, a very freeing concept. And this is coming from someone who is very interested in "enlightenment." It's ironic, but this has been a very enlightening conversation!

Ironic indeed! And I think "ironic" is probably a good way to describe experience in general - as good as any, anyway. There's definitely something "mischievous" about the whole thing!

"Mischievous" ---It's comforting to think the entirety of "existence" is some sort of a joke. Thank you for such an awesome conversation! :)

Our own joke at our own expense, at that! Still, at least we've got a sense of humour eh? That was a nice little exploration - cheers!

POST: Are you guys for real?

Is this a reference to some book or movie?

Well, I guess so - in some ways, it's inspired by the writings of some Berk [<https://www.earlymoderntexts.com/assets/pdfs/berkeley1713.pdf>], although some people find they Kant get into that [<https://iep.utm.edu/kantmeta/>]. I'd view the notion of "dimensional jumping" itself to be an active metaphor to enable dramatic change.

Q1: The most frightening instance of dimension jumping that I've encountered was from Lovecraft's, Dreams in the Witch House.

Dreams in the Witch House. From wiki - "The dimensions of Gilman's attic room are unusual, and seem to conform to a kind of unearthly geometry. "

New one for me. Looks good. I love a bit of "unearthly geometry".

Q2: Yeah this sub seems insane, to be honest. To someone who believes this stuff: why? I am genuinely curious to know what could convince you that people have the ability to move between "dimensions".

A1: Dreaming and exploring things that seem impossible at first is pretty much what the human race is all about. Also bullshitting! I would know, its finals week..

A2: I think you're missing the point - i'm not sure anyone actually believes they're switching places with another them in a different dimension which has mirrors as the holding space between. But at the same time, 'act as if' does have a certain power. treat it like /r/nosleep meets philosophy. Probably it's similar to early Christianity - there were a lot of powerful metaphors being made that can have significant philosophical and psychological side-effects, but for that to happen, one needs to treat those metaphors as a kind of reality. The problem is that when some people's reality of a kind has some effect on them, other people copy this, but skip the middle bit and start trying to understand these metaphors as reality as they are used to perceiving reality and then those people start treating these metaphors as gospel (...no pun intended) and everything gets wacky. So, tl;dr, it's a suspension of disbelief. at least that's how I read it.

A nice angle. The sidebar uses the phrase "Active Metaphors" for this very reason. A metaphor must be fully adopted, lived from, in order to be active. You can't stay in one metaphor while trying to leverage another, just as you can't remain lying down and be standing at the same time. Early Christianity was probably about this sort of thing. That knowledge was mostly lost once we took the symbols and characters and relationships as literal, and then rewrote the accounts a few times from that viewpoint. Not that any of these views are required to use this subreddit.

A3: Slightly tangential: What if you are lying down on a plane that pivots you upright? Wouldn't that technically be considered "lying down while standing", since you are not standing on your own volition?

Haha, I like your style! :-)

However, I would counter that there is a difference between "standing" and "being upright". Of course, this leads us still deeper: because if you are dedicated and play proper attention, you'll discover that it's possible to "be upright" unaided without actively doing "standing". (Recommended reading for such things [<https://web.archive.org/web/20130216142759/http://www.missyvineyard.com/>].)

No euphemisms or double entendres were hurt in the creation of this comment!

Q3: Does leaning (against a wall, for example) still count as standing? Or what if you are partially suspended by harnesses to reduce the weight on your legs? Are we going for a purist stand?

I think that my stand on standing hasn't got a leg to stand on! ;-)

POST: What happens with the other you?

See other posts too [POST: What happens to the other-dimensional you you switch places with?] - this has been answered a few times.

The summary: There is no other you. There's not even a this you. What happens is that you are "shifting your attention" from one experience to another - like jumping dreams. A bit like consciously viewing one dream, then deciding to attach to another instead.

POST: What happens to the other you when you jump?

There's no other you. Answered a few times elsewhere [POST: What happens with the other you?] and elsewhere [POST: What happens to the other-dimensional you you switch places with?]. Basically, this is about shifting attention to another experience. Like changing channels on a TV. When you change channels on your television, do you have to push aside another "you" that was watching the programme you switched to?

Extra quote:

[In response to someone asking what happens to the "other soul" during a jump]; It's more a case of shifting your perspective to another experience. You are simultaneously everywhere (all possible moments), it's just that you are focussed on a particular moment or trajectory across moments. This works because although we think of ourselves as 'inside a body looking out', our actual experience is one of 'being a conscious space' and having thoughts, body sensations and an environment arising within that. A bit like connecting to a particular instance of a video game or shifting your attention across a grid of all moments. In your terms, it would be like your one 'soul' is actually spread across all possible experiences - all experiences are 'dissolved' within it - but it is 'concentrated' on one particular possibility at a time, bringing it into the senses. Everyday Example: Focus your attention on the sensations of one hand. Now focus on the other. When you shift your attention from one hand to another - attend to one and not the other - you don't have to "swap souls" with your hands in order to do this. You are always both hands (and indeed, your whole body), it's just that you are only bringing one hand into sensory experience at a time.

Also, look up the Hall of Records and the Infinite Grid posts.

Thanks for the clarification and extra reading.

No problem. It's potentially confusing, if you are thinking of "physical worlds" and somehow "transferring conscioues" - but actually the world you're in now isn't physical in the sense of being "spatially-extended", other than your own personal perception of space.

POST: [deleted by user]

Scientifically (evidence based) speaking, memories are physical properties stored in the brain.

Actually, not really. Memory is still not understood. No location has been discovered that corresponds to memories, and the mechanism of memory is unclear. But in any case, I have to say, that wouldn't matter. That's all 3rd-person theorising, whereas "jumping" is a refocussing of your attention onto a new format of experience. There is a difference between direct-experiencing (our actual lived life) and thinking-about it (our contemplations and imaginings about that lived life).

- Are you experiencing a brain right now? Really take a bit of time to check.
- Pause for a moment and recall what you had for dinner yesterday. Did you use your "brain" to do that? And is the image you get made from neurons?
- Imagine you have a dream in which electrodes were attached to your brain, and you were shown this on a monitor as they triggered certain responses. When you wake up, where is that brain?

Brains things which are inside your experience, not the other way around.

TL;DR: Treat memories as being part of your "conscious perspective", not as part of the world you are apparently experiencing.

I recommend you to to listen to the 'Joe Rogan Experience' podcast with Sam Harris. #543 is the podcast number. Really interesting.

Thanks, will give that a listen! I disagree with Sam Harris about a few things (when he wrestles with materialism vs perspective) but I always find him a good presenter and thought-provoking.

Since we're recommending...

You might find Bernardo Kastrup worth a look for a more idealism-based perspective, actually, and Douglas Hoffman has a nice "interface theory" for reality. For the more direct experience stuff, I think Rupert Spira is one of the best, and I like a bit of Douglas Harding and his experiments. Finally, George Berkeley is the guy that got me thinking about this stuff originally.

Not quite related (but actually fundamental to this subreddit), a guy called Kirby Surprise (nice) wrote probably the only decent book on (and called) Synchronicity - really it's more about the "patterning of experience" - and there's a good interview with him that's worth a look.

Whew!

I could have entire hours of conversion about it.

Yeah, as you can tell, me too! :-) Cheers!

POST: Alternative methods to Jump

A1: Holy shit, are you serious man? You can just edit your post. Also, methods don't matter.

Q1: Not sure what you are talking about? I intentionally am NOT including these in the main body of the post because the last time I did that some mod nuked the post so it can't be found unless you already know where it is. But I doubt that will happen if it's as comments, we'll see.

See my mod note above. In future, though, please hit "message the mods" if you have a query, and raise it directly. Circumventing moderation isn't really going to help: modding happens for reasons, such as reporting or rules or topic appropriateness. (Remember: as per others' comments, this is not a general chat forum, and nor is it a broad "techniques for self-help" or "magick rituals" forum in the manner of LOA, and so on.)

Clearly from looking out for evidence of that I am clear that view is winning.

I've got a couple of pending comments of yours to reply to which I'll try and get to soon, which might clarify this, but: at the moment you misunderstand the point being made about "multiverses" and so on, and the relationship between "physical things" and ongoing experience, etc. Which is, in short, that "multiverses" in this context would be just another "story" about an experience, but you do not actually experience "multiverses". This doesn't mean it's not a useful concept; it just means it's not a fundamental description of the experience. Also, the very nature of "evidence" is problematic here, because our usual assumptions about shared experiences fall apart. Again, we're back to unpicking the assumption that you are a person-object located within a world-place, and that the "world" is a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'". The point of the experiments is to, over time, indicate that all of these assumptions are somewhat dubious, or at least not constant. This means that we cannot rely upon concepts derived from those assumptions, when 'explaining' those experiences. Where this goes is that, later, in addition to noting the content of an experience - and all the (many) narratives we might construct which fit that experience, none of which seem completely accurate - we also note the context of all experiences.

Basically, we end up asking: what are all experiences "made from"?

I'll try and pick up that other thread soon, to make things clearer. But I think that you are assuming that I am proposing some particular theory or worldview, when in fact what I'm talking about is a non-world-view, or the "meta" perspective of all worldviews and experiences, if that makes more sense.

POST: A film about Dimensional Jumping

Does a bit. Except, I suppose, that it very deliberately omits things like "brains" because in that description there is no place for a "brain" to be. In a similar way to how we attribute results to other entities in error because we can't experience "the doing" (we are not separate from the results), we often identify with "brains" or other objects in error because we can't experience "being a doer" (again, because we are not separate from the results). In both cases, we fail to realise that we are the subject to all experience, rather than an object within experience. All experiences, and thoughts about experiences, are, in a sense, "results". Any descriptions about experiences are themselves further experiences - and because thinking requires that things be broken down into conceptual objects related within a mental space, we end up accidentally "looking past" ourselves as the subject, and in error focus upon: "which conceptual object is 'me'?".

...Yes, he's referring to the same thing - but beware of getting bogged down in a concept of it, which tends to make it complicated. What he (and I and anyone else) is essentially saying is that there is no doer as such; "awareness" (or "consciousness" or "God" or "The Father") refers to the sort of "non-material material whose only inherent property is being-aware" and which "takes on the shape of" states of experience, by becoming them.

"Awareness", then, is a unique word in that rather than a mental object that's pointing to another mental object or a sensory object, it is pointing to the subject or essence of all objects or patterns or experiences. If we forget this, we can start accidentally treating "awareness" (the word, the object-concept) as pointing to an awareness-thing (like awareness is another object, an entity, or a being), and talking about it acting on things or how to understand it or whatever. But since it is "that which all things are 'made from'", that is a meaningless statement. It is self-causing; it shifts-into rather than does-to.

I'd also add that it's important to recognise that awareness does not take on the shape of a 3D world and then you walk around in it. Rather, it's that awareness takes on the shape of this moment of experience - which may be a moment shaped "as if" you are a person-object located within a world-place, that you are "over here" and the rest of the room is "over there" - etc.

The little exercise at the bottom of this comment [POST: I'm so confused] is meant to illustrate that, or at least point in that direction.

POST: 10 People remember a vertical green line in the Banner.

And knowing it is possible helps a ton, even if it's not meant to be emphasized. Normally believing is the challenge.

I wouldn't disagree there. But it's much more powerful to (for example) do the suggested exercises for a specific thing, and have an outcome related to that specific thing arise. And that gives a direction for further exploration (since the "results" may not be quite what one thought one was intending, but provide insight in another way regardless, beyond simply "stuff changed"). Anyway, we keep it on the "deliberate" side because there are already other subreddits for spontaneous experiences (Glitch and Mandela, for instance), and it can easily swamp the subreddit to allow "this weird thing happened" posts; it is meant to be more about investigating. Having said that, posts are allowed to stay sometimes if they lead to an interesting discussion in the comments (the comments are mostly where the sub content is, I'd say). Which was the case with your first post. It's just not very helpful to have multiple, essentially off-topic, posts, because it leads to more of the same, as that then appears to be what the sub is about. And as I said, this does come up fairly often, at regular intervals - because even just engaging with this topic tends to encourage noticing of... this or that.

...

AI: Please stop being so dramatic. There is already another thread on the same inconsequential stuff.

POST: Mdmerafull, hdoublearp, PunkRockParanormal & aether22 remember a green vertical bar.

So, from a previous thread about the number (of which there have been many, so you can use search to find all the different responses that have come up if interested):

We really don't. The mods never change the number, and in fact they couldn't really, not consistently, because it's in multiple places (sidebar, sidebar text post, introduction post, header graphic image, subreddit title, various references throughout the subreddit's post and comment history). Any posts containing it show the time of any edit, just because that's how Reddit works, plus there's [archive.org](#).

As regards changing the header graphic, from an earlier message:

Never been changed since the last style update. To be clear though: the number is guaranteed to never be changed; the style can't be guaranteed because sizing and other display aspects might be subject to updates to Reddit's code, browser or OS updates, and so on. However, when mods do perform a styling update, out of courtesy we'll always make an announcement as we have in the past. Remember too that you can check for yourself independently over at [archive.org](#).

Meanwhile: I'd suggest that if you notice spontaneous changes in the header, then that simply means you are noting that your ongoing experience isn't as stable as you had previously assumed. That is, that your usual assumption of being a person-object located within a world-place may not be entirely accurate, and the "world" may not be best described as a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'" (the standard description). This can be pretty exciting, of course! However: The term "jumping", if it is to have any meaning and to continue to be useful, should be reserved for intentional changes. And in terms of investigating the nature of our experience (and the nature of our descriptions about experience), rather than simply noting that things are a bit more "loose about the seams" than we previously thought, only deliberate experimentation is really of much use. It should also be noted that a "dimension" in this sense might be best considered as a way of formulating change, of structuring an intention and incorporating it. The concept of "dimension jumping" would itself be part of the pattern of the outcome; the "mechanism" is really just part of the target result and doesn't actually cause anything. (This is why the demo exercises are called "exercises" rather than "methods" or "techniques".)

So one has an experience "as if" one has changed dimensions just as one is currently having an experience "as if" one were a person-object located within a world-place. The experience of "jumping dimensions" is therefore better thought of as a change of experiential state: "dimensions" are states rather than places. This of course involves a change in our understanding of ourselves and the world. Which leads to: I'm not sure of the thinking behind altering the header graphic at certain intervals? Given the above.

but excuse me for not being a person that bows to experience fully unreservedly, to anyone ever.

The point here is most definitely to have a discussion! As per the sidebar, you're not meant to believe anything in particular without personal experience or reasoning it out. (And even then, we should be a little skeptical of what lies behind them - if anything.)

This sort of conversation is actually what the sub is all about!

And my understanding is that there is not single "official" explanation proposed by the group.

Right.

Also my life's work is in physics, so because of this I tend toward some version of the Multiverse idea.

That's my background too, although I also have an inclination towards Paul Feyerabend and George Berkeley and the like, so there's that. We have to be clear about when we are being scientific versus philosophical, though. Neither one is better than the other; they just have different limits and spheres of application. I'd suggest that "dimensional jumping" is inherently non-scientific (note that this is not a dismissive statement), although that doesn't preclude it being studied as part of a structured investigation - which is what we're generally doing here.

But if you take the multiverse idea which can be at least partly understood and account...

I'd suggest that while the description may be understood - that is, that it is internally consistent on its own terms - its connection to our direct experience is somewhat debatable. I did a comment over at ME on this, so I won't go much deeper into all that (check it out), but the general point would be that since there is no way to observe "branches" and suchlike, only changes within one's perspective - a lack of "observational touch-points", if you will - there's an issue with taking it as "what is happening" and basing anything off of that. The "multiverse theory" is perhaps more like a narrative or a language we can discuss changes in terms of, rather than an actual theory or explanation. There is no evidence for "branches" other than as one (of many) ways of thinking about quantum states (which are basically just mathematical structures with no

inherent meaning and with no way to distinguish between interpretations). They are definitely never experienced, I'd assert. Within this context, we have to ask: what would a regular changing of the header graphic contribute to our investigation? How can an observed change of header graphic be tied back to the concept of branches experimentally, rather than simply conceptually or narratively?

It ultimately comes down to: what, exactly, in our direct experience, would lead us to conclude that the content of our experience is structured as "branches" and that recent branches are more or less likely?

Also the indication that it changed might well be side effects of an intentional jump for some

How would we distinguish between that versus a spontaneous change? Isn't it the case that, truly, the only definite confirmation of a "jump" is that you intend for a specific outcome, and later that outcome arises within your experience?

POST: How do I learn to do these things?

What "energy"? I'd say forget about "energy" - especially if you can't define what you mean by it - and go directly for the outcomes you want, following the advice below.

...So, to be specific: it's a feeling? And, for example, in social situation, you might want to generate an experience "as if" other people were experiencing that feeling about you, and acting accordingly?

...That makes sense. We have to be careful because terms like "energy" and "vibration" and "frequency" get used in such hand-waving ways as if they were things or causes - perhaps because of their sort of feel-good use in law of attraction type descriptions - whereas here we want to be much more specific about their meaning. The key here, then, is that you'd want an experience "as if" such a thing occurred. This is different to saying that our experience actually is made from "energy" and that this is how the world is structured and how changes are caused, or whatever.

I read that energy is everything... I didn't do anything special but there energy is attracted to mine.

I'd suggest being a bit skeptical of all those sorts of descriptions. Or at least, view them as descriptions - that is, little parallel structures of thought - rather than "how things are". "Energy is everything" is essentially a meaningless albeit feel-good idea, potentially, at least in terms of trying to actually do anything in terms of it. How exactly does "energy is everything" connect to our direct experience? It's so vague. And if it's merely a description of the content of a particular type of experience - a feeling, for example - then it's potentially a mistake to take that content as being how experiences "work". Now, if we said something like "everything we experience is ourselves, as awareness, taking on the shape of sensory moments", that would at least be something you could examine immediately, rather than only contemplate in disconnected abstract thought. Again, though, we'd be appropriately skeptical!

Anyway, I think you're onto a more useful approach with the formulation:

I want certain feelings and experiences.

That keeps things nice and clear. Essentially, you want experiences whose content is "as if" (that is: "consistent with the idea that") there is such a thing as energy and connection between people, whether or not that is how things really are. This avoids you ending up hypothesising about something happening "behind" your experiences, when in fact experiences may not actually have any "behind" or "outside" - or indeed any particular, fundamental, unchanging "how things work" at all.

...Well, it's not necessarily clear that they are attracted to anything, in some behind the scenes way. Your actual experience is of perceiving other people apparently being attracted to you, or of seeing other people apparently being attracted to one another. But the idea of "attraction" is something you are inferring: it belongs to your description rather than to the experience itself. You don't actually experience "attraction" in the sense of a causal mechanism; you have to be careful to not mix up that "buzzy feeling" that is part of an experience, with something that is "causing" that experience. That you have this experience (of seeing this) isn't necessarily due to anything about the "people". There's no "attracting" going on behind the scenes, perhaps. Your experience of apparently seeing such things may be completely down to your own patterning, your own state as an experiencer!

The problem with the idea of "attraction" is maybe that it implies that there are independent objects, located within some sort of environment, and that there is some sort of "mechanism" - triggered by an act of some sort - which leads these objects to move towards each other in some way. These "objects" may of course be people, or some sort of event. But the inherent divisions implied within this description is misleading, I think, because it leads us to try to conceive of some sort of action we might take in order to acquire certain properties which in turn would bring about an outcome. When in fact, if you attend to your actual experience as it is, it is not actually divided in this way. And when you dig into that "attraction" type description, it reveals itself to be so hand-waving when it comes to the specifics, that there's not much of use going on. It's not really a model of experience at all - it's more of a narrative, a language that is used to talk about certain experiences using a certain turn of phrase.

So, personally, I'd move away from trying to imagine some sort of thing that happens "out there" that brings objects and situations from "over there" to "me" (one type of "attraction": the LOA style) and also away from the idea that there is a particular property you can acquire which makes you attractive (another type of "attraction": personal magnetism). Instead, I'd tend to think of this in terms of: how do I go about shaping my ongoing experience such that it contains moments "as if" I were summoning objects and situations and "as if" I was magnetic. That is, experiences that are consistent with those descriptions, those concepts, while avoiding falling into the assumption that those descriptions are how such experiences are actually caused.

POST: If we make our own reality...

[POST]

So I saw many people saying that we make our own reality, and if that's true then how is it possible for unexpected things to happen? things your mind wouldn't even be able to think of... And how is everything so consistent?

[END OF POST]

You don't make your own reality - in that way. That is, you haven't deliberately constructed, via specific choices, your experiences in advance and in detail. It is perhaps more accurate to say something like: what "you" truly are is are what experiences are "made from", and right now you are in a particular state or pattern, from which your moment-by-moment experiences arise.

An analogy:

Imagine that you have a transparent sheet with a grid drawn on it. Now, take another sheet, with a differently-spaced grid, and place it on top. Do you know what the final combined grid will be, before you look at it (experience it)? Note that going off to calculate the final grid would itself be a type of experiencing.

If we take the first sheet to be "how I am now". And then the second sheet to be "an intention". That is the way in which you might say you "make your own reality". Really, it's that you are in a particular state (a sort of "landscape" of facts), and then you deform that state (change part of the "landscape", like overlaying another pattern, affecting the whole thing), but you don't experience the final result until you "look". Even if you know the change you've made, the specific fact you've introduced, you still don't know how that change has deformed the landscape, until you "look" (experience it).

A shorter way to say this might be: you don't get to "pre-experience" your experiences.

They're all "enfolded" into the background, and you only "know" them when they are "unfolded", moment by moment. In this way, if we go with this description anyway, we are in a situation where we both "create" our experience and know it intimately by being the pattern-landscape, but at the same time it is also completely mysterious because we don't know it as sensory-type expanded moments in advance.

POST: Confused on the nature of dimensional jumping

Ultimately, the point of the subreddit is to investigate the "nature of experiencing" by way of experimentation and contemplation (with attempts at generating outcomes being an ideal way to do this). This involves examining assumptions such as...

Out of what I've read though this sub, the experiences that sound legitimate make it seem like an internal mindset change, rather than an external reality change. It doesn't really sound different than the law of attraction (believe something hard enough and it manifests). What's the difference?

...what is an "external reality"? Where is this "internal" mindset and what is a "belief"? How, exactly, would the "law of attraction" work? What does it even mean to talk of "how it works" with regards to anything?

...as if our consciousness has no connection to our bodies, or can go where it wants.

What are "you", precisely? And what is the relationship between "you" and "the world"? Is the world truly a "stable, simply-shared, spatially-extended place unfolding in time" with "you" as an object located within it (the common default description)? Do you ever actually experience that, or is it rather just a thought you have about an idea of "the world" now and again?

This is a lot harder accept and sounds quite a bit more drastic than what I talked about in the last paragraph.

How did you come to accept the default description you are using currently? If you pause and examine your direct experience, now - what is there that is truly stable and persistent about it? What are the facts which never change? Is it not the case the only that which never changes can be fundamentally true - in other words, "real" - and that all other facts must be relatively and temporarily true only? How does this relate to things seeming "drastic" or not?

And so on.

See also - the containing threads for comments here [POST: Questions regarding DJ], here [POST: Won \$500 a few days ago], here [POST: Speculative answers to Frequently asked questions.], here [POST: A few questions.], here [POST: It wasn't a panic attack!] and here [POST: The difference between low of attraction and dimensional jumping] from previous discussions on the differences between the "law of attraction" and "dimensional jumping".

POST: The difference between low of attraction and dimensional jumping

Well everything, of course, works the same way, since there can only be one way things work. But -

This subreddit encourages you to reconsider things at a basic level - what you are and the nature of experiencing itself - and suggests that there is no "how things really are" and there is no "how thing really work". Whereas the law of attraction tends to assume a particular mechanism, or "formatting" to experience, dimensional jumping advocates reconsidering that very formatting itself. It suggests that if you fully adopt a certain metaphor, then your experience will tend to fall into line with that. In the end, it strives for the most flexible metaphor possible that ties up to our direct experience of ourselves as a sort of "open aware space in which experiences arise" - hence the metaphors described in the sidebar. They are to be taken literally, in the sense that you can adopt them and have experiences "as if" they were literally true - what we might call "the patterning of experience". The upshot of this is that, instead of having vague notions of "maintaining frequencies" or "attracting" something, you can adopt any metaphor which inspires you to an intention - an intention which means-that, or logically implies that, you will get the outcome your desire. Choose your own mechanism. Because really the only thing that ever "happens" is intending. However, it is always more important that you recognise the nature of your own experience, since that frees you from having to adopt any particular worldview "true". Unfortunately, the descriptions tend to be a little abstract at this level, because we are actually trying to discuss the thing "before" thoughts or descriptions, or sensory experiences, or even division and change.

If you are experimenting with producing a particular outcome, then really you should consider it "done" at the moment of the intention. It's perhaps a little easier to do this by following the instructions in the Two Glasses exercise (see sidebar links); just carry on with your life neither anticipating nor debating the result, but also not worrying about any passing thought (you should just let them pass by). Basically, it's about having some faith, but mostly it's about not reacting to what comes up along the way, and therefore accidentally re-intending against your outcome.

But luckily for you...

As to your sense of "awareness of my consciousness", just relax and enjoy it. With that open space, you are in the ideal position to be okay with passing thoughts and fears, without reacting to them. Most people spend their time narrowly focused on an aspect of their sensory experience, not realising that they can release a hold on this and they will "open out" - become that "background space" with sensory imagery just sort of floating inside of it. If you've got that, you don't need to tinker with it - in fact, any attempt to fiddle with it tends to reduce it - just decide that if you occasionally notice you have narrowed your focus again, you will "cease" doing so, and allow it to open up once more. Then, fear or discomfort will be like ripples in an ocean, rather than waves in a glass of water.

You probably feel less like a "person" and more like an "awareness", but that's just because you're not used to it. As for choosing things, there's nothing more to it than intention - which means, to deliberately increase the contribution of a particular pattern. The "intention" is the pattern, "intending" is the bringing it into mind. All patterns are already existing; you only ever change how much a pattern is going to contribute. If you think about it: what else can there be? Your sensory experiences and thoughts are all "inside" your open awareness, rising and falling. They have no solidity and can't "cause" anything; they are results. The only cause is intention, and the results happen immediately. It becomes true now that the event will happen then. Of course, that's not something you should take anyone's word for - it's something to experiment with and test for yourself, and decide whether it is true or not. In small ways, and then in big ways. Only you can explore this; nobody can do it for you.

So is this state the same state I get in meditation? And I don't feel like I 've done any jumping. Just made connection with that awareness so now I can be that awareness. I definitely feel like less of a person and I want to feel like a person you know it's weird. Are you constantly in this state?

The difference would be, do you feel less like a "person" but **more open and alive** - or instead do you feel dissociated and numb? What you are after is to feel like a big open alive space, with your sensations, perceptions and thoughts floating in that. **You should feel good.** If instead you feel like you have shifted position somehow, but are not open, then you might want to adjust that, by - for example - lightly centring yourself on the centre line of your body (just behind the eyes, centre of the chest, or lower abdomen) to feel a bit more connected.

"sensations, perceptions and thoughts" yes. Alive as of means just having the awareness and observing. It feels good (currently I hold it back) but maybe because I am not used to that stillness and feeling pleasant out of the nothing and maybe I decide that is something wrong and artificial. But certainly I am not numb in a negative neither neutral way. I am confused. And maybe it's due to the thought that I won't get any further than this stillness and not have that higher emotions that I know as a person.
Edit: Maybe I am not open that's why it feels like there's no air there and you are not required to breath.

Sounds to me like you are just settling in and getting used to not constantly reacting and bouncing around like a rollercoaster! Also, it can take a while to get used to that different sense of "location" compared with what you used to have (since now you realise you are sort of "everywhere and nowhere", and always were, in fact). Anyway, I think you'll gradually feel more comfortable with letting go to it, and it'll settle out by itself, one way or the other.

In this state do you reach higher emotions different from peace? I want to feel emotions like love, ecstasy, creativity.

There's nothing stopping you reengaging and having more of a rollercoaster experience again if you want. The open space thing, once settled out, should feel sort of like "open joy" and feel decisively positive (since it's basically near-unobstructed awareness), but it's a position of choice rather than limitation.

Is it wise to do the mirror method everyday after it hasn't worked. I also kind of split it into two session. Anything wrong with that? Is there any restrictions? Basically can you do how many times you like till you feel fully satisfied.

I can't speak to the mirror method personally. If you were doing the Two Glasses exercise, then I'd always say to wait until things settle out - days, a week - because results

there usually come by "apparently plausible but seemingly unlikely paths" and you can't "get better" at doing that.

In fact, you can't really "get better" at intending as such, I'd suggest. However, you can intend persistently until you get "the feeling of something being true", when bringing to mind a particular scene or pattern or whatever which means-that you've got your outcome. The trick is to make sure you don't reset yourself every time you do it - like, to reuse an example I've used before, sitting down again before intending to stand up (you don't end up "more stood up" by repeating the sequence).

Q1: BTW, this is an interesting book based on a very similar way of thinking: [<http://www.amazon.co.uk/Changing-Reality-Huna-Practices-Create/dp/0835609111>]

I've read a little on Hawaiian traditions - where they overlap with the "reach into yourself because that's where the world is" approach of other traditions - but that one's new to me. Thanks.

Q1: It's a really good one - I bought it in Foyles, but I'm sure you can buy it online.

EDIT: what is particularly interesting, I think, is that there are some exercises provided, but it is sort of made clear that these are just for the ritual/symbolic value, and you can replace them with anything else. I actualIt meant to recommend this to you long time ago, but kept forgetting.

Foyles: by far the best book store, you have excellent taste! :-)

I've bought a Kindle copy and had a quick browse so far. Yes, it does seem to have that attitude of: here are some worldviews, but their importance is as structures for experience, and should be used based on usefulness not on "being true".

Overall, it seems like an excellent survey of all the ideas or things one might experiment with. If there's anything lacking (from my first skim reading), I suppose it's a more explicit tying back of experiential content to our "nature" - I think that this could have provided a foundation that would helped the last sections (on "shifting realities" and also what he describes as "grokking").

But otherwise a really nice clear read, which is specific about explanations just being stories, that you have to actually explore it to understand it otherwise it's just inert "knowledge". It even has a section about "patterns", so I'm obviously going to approve! :-)

Q2: (I apologise for not replying properly before , but I had to go back to the book to comment in more detail)
Yes, I really liked the author's take on reality and his exercises (re-arranging shells for example) remind me of what you are trying to introduce in the Dimensional Jumping sub. The idea of 'changing your symbols and changing your life' (p. 179) is very much what you advocate, and puts the focus rather on the spirit of things than the actual ritual ('what kind of candles should I use?' etc.).
I also realized, while reading it, that I am a natural shaman ;-) :-D I've mentioned many times here I've always had lucid dreams and I seem to solve quite a lot of issues in those dreams. That's why I like the book; although you are right it could be organised a bit better, I feel the general idea seems very natural and not forced, with the 'change from within' instead of some violent manipulation of the 'world around us'. I think it is helpful to read something that incorporates these ideas into the normal, every-day life, instead of showing them as some kind of 'supernatural' force.
(BTW, when I was in Costa Coffee the other day, I saw a guy trying to explain parallel universes to some random coffee drinkers ;-) Maybe he was a fellow Redditor?)

Yeah, I like how, later, he emphasises the four worldviews as being simultaneous perspectives, which links those shells to both the "objective" and "symbolic" angles. The perfect approach for a "natural shaman", of course! ;-)

Hmm. Do you think we have accidentally created a secret coterie of incognito jumpers, some of whom have now decided to feel out for additional members? It all fits: certainly they would be Costa or Nero rather than Starbucks! :-)

Q2: Well who knows where he jumped from? :-D I wanted to talk to him - maybe make a joke and/or snoop a little - but he left. Maybe we should wear t-shirts with 982? ;-)

Haha, maybe! We're getting into real secret society nods and winks here, updated for a modern aesthetic.

Actually, the header graphic design is loosely based around the idea that "dimensional strands" are colour-coded, and so 982 would be a particular strand or synthesis of multiple strands, like overlapping patterns. A bit like Peter Saville's designs [<https://www.eyemagazine.com/blog/post/upon-paper>]. So the t-shirts could be even more abstract and mysterious and "only those who know, can tell" than having the number!

Q2: The Secret Society of Dimensional Jumpers! Imagine the conspiracy theories that would evolve around us :-D
But imagine the excitement if you saw another jumper on a train, wearing some discreet colour scheme.

It could get very confusing, though, once your ongoing experience got patterned with the colour scheme, owl-style. Soon the world would seem to be entirely filled with jumpers, exchanging knowing glances on public transport!

Q2: Well true, and you will keep bumping into yourself from other dimensions as well. But still, next time I see someone talking about parallel universes I will make various hints and look at them in the meaningful way. Or shall I make owl sounds? Hoot hoot.

Hmm, I'll be looking forward to you posting the results of your "look at them in a meaningful way" experiments. ;-) Of course, once we get the eyewear range up and running, none of this will be a problem. (8>)=

Q2: OT, but you (and other Reddit shamans) may like this; [https://www.youtube.com/watch?v=uwd-nWr_-70]

I like a bit of flute! Here's my current somewhat more downbeat listening: Endless Falls by Loscil (full album playlist: [https://www.youtube.com/playlist?list=PL1EAF0D24D35C2235])

POST: It wasn't a panic attack!

I've experienced something that blurred the lines for me between dimensional jumping and the law of attraction.

Really, they are just modes of operating. The "law of attraction", "dimensional jumping", "strong energies" and "being a person hanging out in the world" are all on the same level. It just so-happens that the last of these is our strongest habit and so it seems like the "normal" one, which makes the others seem special. In each case, what is really happening is that we are explicitly or implicitly choosing a particular worldview or conceptual framework and adopting it, such that we have experiences "as if" they were true. But none of them are fundamentally true. There are actually no inherent limitations to your experiential content at all. So don't let the specific labels get in the way of experimenting or lead you to overthink things.

Aside - It occurs to me that some of the problems people have with the law of attraction, is that they try to work out how it works - as if there is a pre-existing mechanism that needs to be understood, a technique to be mastered. Actually, you are better to simply fully commit to a particular description of "how things work", because that will lead to an experience "as if" that is how things work. Ironically, going looking for the right way to do it is basically an intention to have the experience of searching for a right way to do it...

POST: Speculative answers to Frequently asked questions.

[POST]

Warning: Prepare for a wall of text

I think it may be presumptive of me to consider myself an expert in this topic, but I do think I can shed some light on many of the questions that frequently come up. Rather than just reply to all of them I thought I'd make this post.

Premise: Dimensional jumping is a subset of the "Law of Attraction" and similar manifestation concepts (magick, positive thinking, etc). As such, it is more or less a metaphorical concept. It is important that you keep in mind that dimensional jumping might not literally involve moving from one dimension to another. However (for reasons that are a bit deep for this post), it is likely the most accurate metaphor for how the system really works.

FAQ

Is it possible to_____?

In general, yes. You can insert literally almost anything into this box and the answer is yes. However, that does not necessarily mean it will be easy for you. In general, the system protects against things that violate what we perceive as the natural order of things (i.e. laws of physics, the continuity of reality, etc). That does not mean these things cannot be violated, but just that if your desire can come about without violating these then it is more likely to choose the path of least resistance.

For example: If you've had a pet pass away, and you'd like to go to a reality where the pet was still alive. This is possible, but it is unlikely that you would be willing to effectively rewrite the laws of physics to make it possible. The more likely event will be that you suddenly and coincidentally find a new pet who behaves suspiciously like your old pet, and fills that same emotional need. You may even suspect that the new pet is a reincarnated version of the old one (possible, but not necessary).

Ok, so if "almost anything" is possible, then what is impossible?

Though I'm sure not every here believes in channeled information --I have my doubts about much of it myself-- I do often find things from Bashar to be very insightful. In this regard I think his Four laws of creation are the best way to answer this question.

For practical purposes I think we can simplify it even further to two laws for dimensional jumpers:

1. You exist -- You cannot jump to a place where you do not exist (Though if you really stretch you could find a way to pretend you don't exist if you wanted)
2. Everything changes - You can't stop things from changing.

What happens to the me in the reality I jump to? What happens to the me in this reality when I jump?

This is a question that actually goes very deep. First, its important to realize that in the grand scheme there is only one you. However, that "you" may be in many realities at once experiencing itself as discrete versions of you. This is largely academic and doesn't affect anything.

I think it may be easier to divide this into two questions that really strike at the heart of peoples real concerns:

Am I causing harm to the alternate version of myself by taking over his/her life?

No. It is very likely that there is no alternate version of yourself with whom you are switching places. But if there is, then that version of yourself chose to switch in the same way that you did. If there were no other way to achieve your jump than to go to a universe where there is a version of you already existing, then you will enter a copy universe.

But going deeper, this answer isn't 100% accurate either. It is important to realize that dimensions aren't perfectly discrete. They exist more like wave functions, allowing all probabilities to exist until they need to be observed. Think of it like a computer game. In most computer games, if you walk into a dungeon, the inside of the dungeon has not been rendered yet. Once you step in, it begins to render. But even then the render is only partial because it does not render the elements you do not see yet. Instead it starts making decisions about what is probable, and what it needs to be prepared for you to see. Then when you see it, it renders those frames. So there isn't a dimension where you were born a different gender, 5 inches taller, or with blue hair. Instead there are multiple -near infinite-- hyperdimensions of probability where all of these things are true.

What happens to my loved ones in this reality when I jump?

A bigger question is : Where are your loved ones now? Going back to the idea that dimensions aren't perfectly discrete, realize that the dimension your loved ones live in is not the exact same dimension as yours. Instead, you share a hyperdimension where your individual dimensions overlap a bit. The things you do in your dimension affect those closest to you, but only if they allow it. In the same way, those close to you affect you, but only if you allow it.

The people who are close to you, are that way precisely because you choose to be in very similar dimensions. If one of them decides to radically change themselves, you may find that they suddenly move away, die, become imprisoned, or simply change friend circles.

So the direct answer to the question becomes a bit complicated. They may experience you dying, or moving away. But they may have already experienced this. They choose their overall experience of how they perceive you. You simply help them by filling in the gaps...you add a personal flare to the "you" they want to experience through your choices and actions. Your choices and actions tug on their reality and pull it in a certain direction. They can resist it (but usually don't).

However, you only stay close to those who are in realities similar to yours. So if you make a change radical enough both of you will experience drifting apart from one another....except not always. If one of the people in the group does not want to let go of the experience of the other person, then that person may be replaced with a sort of "bot" to simulate the experience.

So here is an extreme example: Your spouse is in the hospital with a terminal illness. You want to jump to a reality where they do not have this illness and you can live your lives together. What happens if your spouse truly exists in the reality where they have a terminal illness? Well, you would jump to a new reality where your spouse would miraculously recover, while they would stay in their reality and experience their choice of interaction with you. Presumably they would experience you staying with them lovingly until they died (and perhaps some version of you does exactly this).

But then does that mean the spouse in my reality is not my spouse, but is a bot?

Maybe, but not necessarily. As mentioned above it is possible that there are multiple discrete versions of each person. So they may simultaneously choose to experience dying in the hospital and their miraculous recovery. Perhaps, they may even choose to have one version of themselves go along with you just to aid you in your choice of realities.

It is also possible that your spouse is only existing in the universe where you perceive them to have an illness because you are choosing that universe. They are simply agreeing to go along with you, and when you choose to go to the recovery universe then the illness universe disappears back into the cloud of probability (I choose to avoid the word "collapses" because that actually has the opposite meaning in quantum physics).

So if you are worried about how your choice might affect your loved ones, realize that the choice you are making now to not perform an intentional jump is affecting them in some way as well. They may be anxiously waiting for you to jump.

It is important to remember that each individual chooses their path. We do influence one another. That influence can be very strong (especially against a person who

does not have strong beliefs). But we never actually "force" someone to experience something they didn't agree to.

Wait, go back. Are you saying we live in computer simulation?

No. Not really. But a computer simulation is a very good analogy for the true nature of reality. It is a small technical distinction, but an important one. It is more accurate to say that our idea of "computer simulation" is a way we chose to mimic reality to understand it. We do not literally live in a computer, at least not the way we understand a computer physically, but many of systems of reality are very similar to a computer's operation.

How does that work really?

The "computer" that is our reality has simulated any and all possibilities and carried them out in a deterministic fashion the form of a wave of probable outcomes. It biases most of its power towards the most those outcomes that the observer (the player of the game --i.e you) are more likely to choose to experience. Then when you make those choices it renders the outcome.

This is the technical way of looking at the thing many of these enlightened people have been saying for so many years: "All is one, and everything exists right NOW". The whole thing is just a big collection of possibility. Time, different universes, different choices...all these things are just different points and directions inside the same thing. Further more, if you are playing a game you know that when you walk for 4 hours in a computer game, that you aren't actually physically going anywhere. It's all inside the computer. In the same way, all distance in reality is simulated. All difficulty in moving from one reality to one another (turning your hair blue and living on mars with Beethoven) is simulated. All of these things are directly right on top of each other.

EDIT: u/TriumphantGeorge/ pointed out that I should make a distinction here. There is really no "how it works" in the grandscheme of things. (see his comment below). But for practical purposes I believe everything mentioned here and elsewhere on this sub is useful framework. But, in general, on this sub if TriumphantGeorge says it, it is usually pretty accurate. It is just unfortunate that maximum accuracy requires maximum ambiguity So none of this is real?

This is as real as it gets. Have you ever really defined for yourself what the word "real" means? The concept of "real" is defense mechanism. It is the same idea that attempts to enforce the continuity of reality. It is probably put in place by the system to prevent wild jumping around in the system. When looking at reality from this high a perspective its easy to see that he concept of what is "real" has no actual meaning.

Then how does mirror method/ two glasses work ?

These techniques are sort of like brute force hacking. They are about allowing yourself to let go of the unnecessary hold on continuity of reality by giving yourself an excuse for glitches in continuity. So tomorrow when you ask yourself, "Wait a second, wasn't my neighbors car red and now its blue?" You can give yourself the excuse that you've "jumped". What is more accurate is that you've just allowed yourself to "jump" further and in a different "direction" than you normally do.

There are many things that create artificial difficulty in jumping, but personally I feel the need for continuity and causality is the strongest. We fight tooth and nail for all of it to make sense, but it doesn't have to. These techniques are sort of hacks to get yourself into the mood to allow some of it to not make sense. Or rather it is a way for you to make sense of the discontinuity.

As such, proper technique is less important focus, intention, and belief. So don't worry if you spill water doing two glasses, or you don't see anything weird with the mirrors. All of this is secondary to trusting and focusing on your goal, and allowing the technique you choose to work.

That's all for now. If anyone has some other questions that I can add to this, I can either reply in the comments, or if the question is general enough for a FAQ, I will edit it in later.

[END OF POST]

A couple of quick points:

Dimensional jumping is a subset of the "Law of Attraction"

I'd probably say that "dimensional jumping" overall is an umbrella for all changes to experience; the specific metaphor of "dimensions", meanwhile, is a subset of that. Dimensional jumping in its broader sense attempts to be a "meta" view, prior to any particular model of experience or change, assuming only that there is some structure or "patterning" involved (the most basic description that can still "makes sense").

it is likely the most accurate metaphor for how the system really works.

Although for convenience we usually ignore this, it's definitely worth emphasising that there is no "how it really works", and that the idea of there being a "how things work" is itself a metaphor.

The actual closest we can get to "how it really works" is probably something like: "you are that which takes on the shape of experiences; you can shift your 'shape' and therefore your experiences" - that's it. Which, of course, is basically saying: you just do. This can't really be described, so we often use misdirection to help things along, in both our descriptions and in our exercises. (Everything we do say about it is a "parallel construction in thought", and is itself just another experience at the same level: the experience of thinking about the nature of experience and change. And so on. Everything is an experience, with nothing "behind" it.)

This means that if one does want to use the simulation metaphor - because they find it attractive and it suggests certain ways of thinking about change that they find useful - they should bear in mind that it is not you who is inside a simulation run by an external simulator, rather you are the simulator which is "running" the simulation within you.

Technically that's not how the computer really works deep down, but it is a method to get at the core to achieve results.

And it's worth noting, I think, that it's completely fine to go with the "simplified diagram" version of things like this. We are not saying that "this" is "that", we are simply saying that there are benefits in viewing the world "as if" it corresponded to certain aspects of "that".

[There is no "how it works."] It is, but this is such an advanced concept.

But also it can be a very simplifying one: that is, that it is "all experience, no external world" or "all patterning, no solid substrate". As always, it depends on the aim. If it is simply to provide a method which "gets results", then it can be temporarily beneficial to just say: "this is how it is", and in acting from that model they will have experiences "as if" it were true. Ultimately, though, this is somewhat of a dead end, and people start questioning the method, which then affects the results. To really become free and flexible, and not get lost in disruptive theorising, we have to come to the realisation that the "how it works" is also based on intentions and their implications. Not only does performing an act with intention bring about a result, it also implies the context of the intention. In other words: if you go looking for evidence that things are certain way, you will have experiences "as if" they are that way, when they change their mind, another way. Not knowing this can be very confusing.

So yes, technically in a sense using the simulation metaphor is sort of like picking an operating system and programming language.

Right, in a way. Once we are aware of this - that metaphors are "formatting" rather than explanations - then we are freed somewhat from the tyranny of trying to "understand" a mechanism that isn't there. We can treat the use of a metaphor as a choice of how we'd like things to be, rather than it having to be fundamentally "true". At that point, we realise that we can stop looking for descriptions which explain experience (whew!) because we understand that descriptions are patterns overlaid upon - or restructure - experience. Therefore, "how things work" is a pattern in experience in exactly the same way as the pattern of events resulting from an target outcome; they differ in terms of abstraction, not of kind.

I've added an edit in the post that hopefully helps make that distinction.

Note that this wasn't about pointing out flaws in your post; I was just picking up on some threads for an expanded conversation. You should leave your post as it is - it fulfils your purpose as stated - and readers can then follow what's written in the comments, if they want to dig deeper.

This recursive logic bothers me.

The recursive logic can be problematic, but I actually think the drive to release oneself from that recursion - the "stepping back" from that - is where you shift to a different context, and grasp your actual situation.

The question that we end up asking is:

- What are "you" and what is your relationship to "the world"?

Or shorter version:

- What is the "nature of experiencing" itself? What is the context of experience rather than the content?

And the answer to that, which is arrived at by (really simple) directly looking at our experience as it is, means we don't need to battle with the recursion issue. Although it's still slightly claustrophobic to try and think of it, because it as something with no "outside" to it, it can't be thought of conceptually, only directly intuited.

Also, the "you just do" sounds suspiciously like "I am that I am".

Well, it's inevitable we end up with phrases like that, because we're trying to point out that you are the entire moment of experience. Even when you are having the experience of apparently being "over here" and the screen is "over there", in fact you discover you are everywhere, just having "taken on the shape of" that experience of apparent separation.

It sounds very exotic, but it's very simple: anyone can close their eyes right now and try to:

- a) find the "edges" of your current experience,
- b) find where "you" are in your current experience.

But of course, it can't really be put into words. We end up with metaphors like: What you are is a sort of non-material "material" whose only inherent property is being-aware, and which has all possible experiences "dissolved" within it. It can experience any of those possibilities simply by "shifting" itself to "take on the shape of" that experience. Right now, you have taken on the shape of the experience of being-a-world-from-the-perspective-of-a-person.

And a whole load of other metaphors involving blankets, beaches, water, and anything else that's vaguely malleable! :-)

[Free Will and Determinism] But I can't quite put that into words as to why that is, I just know it as an intuition.

Right! It cannot be thought about, it cannot be described.

The essence of it is, while your state between shifts is fully deterministic, you-as-awareness is not. Awareness is "before" all structure and formatting, and that includes division and multiplicity and, relations and changes in space.

So basically, there's no point in trying to work out whether you-as-awareness has "free will" because, in a sense, both "free will" and the "working out" are "made from" awareness. However, you can know it directly (intuition). And in fact, this direct knowing is the same way in which you are experiencing the entirety of your current state right now, even though only an aspect is "unfolded" as 3D-extended senses.

Aside - I think that confusing the formatting of the senses with the formatting of the world-as-it-is can be a real stumbling block, and is what leads people to think of the world being a fixed 3D-extended "place", and there being an "outside" to their experience even though a moment of directly attending to it reveals there is not. The ingrained idea of the world involving "separate people exploring a spatially-extended place unfolding in time" is a big hurdle.

Yes, but now it seems more accurate to ask what is the world's relationship to me?

Yes! And I think that urge to reverse the wording is the first thing that comes out of the contemplation of this. And then, having taken that step, the rest becomes much clearer, more easily. Yeah, time to get some dinner, that sounds like a good idea! Catch you later.

A brief addition, because someone posted a follow-up comment and then removed it, but they brought up a good point, about the difficulty in thinking about this - and the subsequent difficulty you can have trying to think about anything. Once you've recognised that you-as-awareness as the true nature of experience, you can end up being caught in a bit of a bind. After all, you-as-awareness cannot be thought about, and trying to think about it can feel either slightly claustrophobic as you try to turn yourself almost inside-out while having no "inside" or "outside", or unmoored because you have no stable platform within experience from which to comprehend experience. Because of this, it is good to take one particular perspective and go with that as your "default formatting". Remember: there is no special or ultimate "shape" of experience you should be aiming to adopt, you don't have to be seeking to constantly experience yourself as an unformatted space whose only property is being-aware - because: then what? It is enough to know that is the case, regardless of the experience you are currently happening. What we want, then - since there is no "correct" perspective - is to select a basic perspective which is the most flexible and beneficial.

The ideal default, I suggest, is to format yourself as "a background space within which sensory experience arises". This places you-the-observer as a pure, relaxed, background expanse, with you-the-content floating within it. This gives you a stable platform to operate from, to think from. You view the world, then, as "a three-dimensional multi-sensory thought of a world, that is floating in the space of a perceiving mind". Other thoughts are then parallel experiences, floating in mind. You can of course then choose to reshape yourself as "being a person in a world" when you want, but you will always have this format of "being a space within which the sensory thought of a world is floating" available to you going forward.

Q1: *you don't have to be seeking to constantly experience yourself as an unformatted space whose only property is being-aware - because: then what? It is enough to know that is the case*

the formatting i'm having at the moment is along the lines of changing my patterning from an apparent "internal/mind-only state" and expanding it to become "the world" because before, my experiences were felt only intellectually (which is purely a fictional experience itself) so by changing that to be-the-world it should then become manifest because all events are rooted in consciousness anyway [https://www.youtube.com/watch?v=oqOjFC9MCDc]: the intention of creating something creates it

The ideal default, I suggest, is to format yourself as "a background space within which sensory experience arises".

this is the goal

You can of course then choose to reshape yourself as "being a person in a world" when you want

this is what i am doing by "transferring" the intention from an apparent mental-construct to an apparent-physical experience

yet both are the the same in principle being derived from an intention manifest in consciousness

The intention of something is that thing! The thought of something and the actual something differ only in their intensity and their location (3rd person vs 1st person, basically). Isn't this shift in relative position - changing from watching something to being "clothed" by it - actually the essence of what you're speaking of ?

POST: Won \$500 a few days ago

Congrats on your win!

I believe dimensionaljumping and law of attraction are essentially the same thing.

The usual philosophical follow-up questions: What "thing" is it, precisely, that both "dimensional jumping" and "the law of attraction" are? How does the law of attraction work, exactly, and what does this imply about the nature of our ongoing experience - and the nature of "the world" and "you"? Strictly speaking, without answering that we can't really say that "something triggered the win" nor that two things are the "same thing".

Im guessing it was the feeling state that shifted me into an experience that matched the state?

It's potentially a way of looking at it. One possible model is that adopting a particular pattern (an image, a feeling, whatever) can trigger the associated extended pattern into prominence, and that this then informs your subsequent experience. Although we might wonder: what are "states" made from? And where are they? Or are they just metaphors which are used to formulate intentions, and which have no existence other than that?

The idea being, that the more clearly structured our description is, the more we move towards a situation where any apparent results can be linked back, and the outcome repeated (eventually ruling out coincidence or a tendency towards superstition).

It's hard to pin down what, if anything, triggered the win here, I think, because there was a bit of a muddle of activities going on in this case. Did you get paid in \$100 bills, for example, as in your visualisation? Or was there a more specific intention that accompanied the image? How would you go about repeating it - what have you learned from the experiment that you could reuse?

I played the scratch offs for the sake of enjoying the game without caring if i won or lost.

Yeah, I do think the attitude of basically "being okay with whatever happens" is a key ingredient, even when it comes to managing and directing everyday life, never mind the more esoteric experiments.

I was grateful for having that experience I desire, now. Without the feelings of desiring/yearning (that would imply having it in the future).

Perhaps the stability and relationship thing didn't come with her because I hadn't gotten to that part on my list yet before she came up and said hi

Ha, I love that. Following on from what you say about "yearning", I agree that does have an impact. We might draw the connection between this and "thinking about" vs "experience of". If you are thinking about something, imagining it in the 3rd person, then it is "over there" and you are "over here". There is a distance between it, and it is that distance, the gap between the desire and fulfilment, which leads to the yearning. For as long as the outcome is held in this 3rd-person state, then it cannot be experienced. For it to become an experience, one needs to be "clothed" by the outcome, it must be released from suspension "over there" and be allowed to dissolve into the main strand of experience "over here" - the 1st person. Basically, you must allow it to cease being a located, bounded thought, and become an unlocated, unbounded thought - because that is what ongoing experience is. To release something, then, is to allow it to dissolve into the background, and therefore become integrated into your main strand of 1st person experience. One might skip this, however, by formulating your intentions as "unlocated, unbounded" thoughts in the first place, rather than as object-type thoughts - provided one wasn't resisting change to the main strand at the same time.

POST: Questions regarding DJ

So, for your first point, see previous answers about "dimensional jumping" and the "law of attraction": here [POST: Won \$500 a few days ago], here [POST: Speculative answers to Frequently asked questions.] and here [POST: A few questions.]. As for the story, it's just that: a /r/nosleep type story "inspired by" the topic of dimensional jumping (although really a misunderstanding of the topic as it is described in the sidebar).

Q1: Wow, thanks for the fast reply tho, would you be able to explain the difference beetwen DJ and LoA for dummy people please? Like I though it was something like: DJ (2 glasses) might "change everything" (might change your relationship with parents, close people etc) just for your wishes while Law of attraction you're just asking for one thing while it be the only thing changing or only things around it wil change.

Your timing was good!

So, the real answer is that "dimensional jumping" and "law of attraction" are both aspects or artefacts or leveragings of a deeper truth. The difference between them is, I'd say, that "dimensional jumping" is knowingly employing this and understands there is no solid underlying "how things really work", whereas the "law of attraction" tends to be based on a hand-waving sense of there being a "how things are really". (And often a poorly-defined one, leading to almost superstitious behaviour in search of "vibrations" and the like.)

At root, though, they both work because change arises due to intentions and their implications - and the world-descriptions those intentions are structured in terms of - rather than due to a technique or method based on the world being a certain way independently of those intentions.

Q1: Thanks for all your answers :) so after all there are no big changes if you do 2 glasses if you dont really want big changes around you due to whatever you asked for, right? Since you might make the shape of whatever you want.

Right, so the idea is that when you write the labels you contemplate the specific situation you are in, then contemplate the specific outcome you want, and in each case "feel out" the words that capture those situations (that is, you let the words come to you rather than logically working them out). There's no reason for anything more dramatic to happen, other than what makes sense in terms of "this" turning into "that". You're not going to some other drastically different place, you're just tweaking up your current experience a bit by "re-patterning" it (is the concept behind the exercise).

Q1: Alright, thanks :) It sounds better than dimensional jumping wich sounds kinda shady actually compared to what it really is. Since as far as i've understood there's no jumping to other dimension (thats why you are not ocupping any other body and yours its not ocuped either)

Yeah, well "dimensional jumping" is just one of many metaphors which, the idea goes, you can use to generate experiences "as if" they were true. So, if you want radical change in your life, something that breaks the rules a bit, then constructing intentions in terms of that metaphor allows you to "re-pattern" your experience in a way that actions based on the usual world description would not. (Although there is also some misdirection involved to ensure that you don't resist, or later counter-intend, the outcome.)

Fundamentally, you never occupy any body, you just have an experience "as if" you are "a body within a world". The deeper observation referred to earlier, is realising that the only fundamental truth is the fact that there is an experience happening - that is, the fact of being-aware. The actual content of experience, though, is impermanent and has no solid underlying substrate, and hence the possibility of shifting its condition without limitation. (All of which, of course, should be checked by personal experimentation; you're not meant to take anyone else's word on this.)

Q1: What breaks my brain is that then, the world is a place of shared experiences, right? Since, as an exemple, i've met you, and you're an human being more than something that i've created.

That's everyone's favourite topic, apparently! See recent discussion: here [POST: What happens to the other 'you's when you jump?], for example.

Q1: I feel like a freak but i find these "theorys" (for scepticks or however its written in english) interesting. But, what would happen if 2 same persons make the 2 glasses method to be attached to the same person, lets say "x" and "y" want to be with "I", what would happen?

At a fundamental level there are no people and you are not actually a person! Basically, don't worry about it - you can treat it like a "private copy" of the world where everything in your experience is an aspect of a larger you. As I say, the only thing that is always true is the fact of "awareness"; everything else is true on an "as if" temporary basis only. So there are no conflicts, because there is only ever this experience happening.

Q1: Thanks for all the answers btw :) That sounds totally awesome, is this connected to the astral projection/law of attraction philosophy, i mean, we're here to live, so just do it. Or does this go in other way that people who believe in karma and so would reject this, like if this woud be cheating?

Welcome! I don't think the idea of karma as in "judgement and payback" is valid. There are no inherent rules-based morality laws or an independent benchmark for appropriate behaviour.

There is karma in the sense of, if you "pattern" yourself with a particular outcome or a particular worldview - whether by intending it or doing something that implies it - then it will become prominent in your life. But that's not the same as "balance" or whatever. Rather, it's just what a "patterning" approach means by definition: you get what you assert plus the logical implications of that assertion - i.e. if you intend something then you are also intending a world in which that intention makes sense.

So, basically just do it. There is no morality or judgement outside of yourself, so it's up to you. The nature of "patterning" does imply a certain "do unto others (unto the world-as-experience) as you would have done to you", though, of course.

Q1: wow! This is a very interesting and good point of view, mother of god. So, what do you think about the infinite knowledge that is right now in the universe? Like, none of it "exists" as it trully is, or it is really something exist and we discover over our experiences?

You could consider that the world is not so much a "spatially-extended place unfolding in time" as a "toy box of all possible patterns and experiences, from which we draw to create our 'private copy'". All possibilities, then, are present eternally (which means "outside of time" rather than "forever"), "dissolved" into the background. However, that too is basically a metaphor which you can experience "as if" it were true, albeit a metaphor which gets closer to being completely inclusive. Again, only being-aware - or "awareness" - is fundamentally true (exists), however it can "take on the shape of" any experience "as if" it were true (exists). To summarise this view:

- What you truly are is "awareness", a sort of non-material "material" whose only property is being-aware, and which "takes on the shape of" experiences.
- The experience you have taken on the shape of right now is one of apparently being-a-world-from-the-perspective-of-a-person.

The problem we have when thinking about it (this is covered in the last link) is that our thinking is already pre-formatted into a "shadow sensory" shape. We cannot think of things which are "before" experience, because thoughts are themselves are just experiences. We have to be careful and not make the mistake of assuming the-world-as-it-is is of the same format as our sensory moments, since they are just a particular patterning themselves. This tends to inform our idea of what "to exist" means.

Generally, I'd say that everything exists as potentiality (enfolded), and the current sensory moment exists as actuality (unfolded). However, right now you are actually experiencing absolutely everything, and this is true always - however, different pattern-facts are just "brighter" than other pattern-facts (their relative contribution to this sensory moment is stronger). We might call the current relative distribution of pattern intensities our present "state".

Basically:

- Think of the situation now that you want to change. Pause and wait for a word to come up which feels like it fits as a summary of that situation.
- Think of the situation as you want it to be. Pause and wait for a word to come up which feels like it fits for that.
- Use those words for your labels.

Follow the instructions as they are written in: these instructions [The Act is The Fact - Part One: An Exercise]. That's it!

Q1: Hi again. Tried it about last week but literally: 0 changes. Not even around me. If done the two glasses but the glasses aren't transparent at all (they have like pictures). Does It matter? I'll try again soon, but I'd like to know how to do It perfectly when I just want to thing one change while maintaining my family bounds exactly the same.

The properties of the glasses don't really matter - although it's helpful if they are transparent to some extent so that you can see the water levels and so fully experience the pouring of the liquid. So don't worry too much about that. Other things to consider: remember to follow the last instruction; generally allow a week or so for anything to become obvious; later, if no luck, perhaps consider whether you are someone who "holds onto themselves" in everyday life, do you "control" yourself moment by moment?

Q1: What do we mean by "controlling", sorry for obvious questions but since english is not my main language (not even close to) somethings might be a little bit confusing to me.

It's not you - it's hard to put into words anyway! So, an example:

Sit in a chair. Now stand up.

Does it feel that the standing up experience just "arises" and your body "moves by itself", or do you feel that you are "doing" the standing up? If you feel that you are "doing" it, can you identify what it is you do? Are you tensing muscles? Thinking intensely? Narrowing your attention down? Do you begin by re-asserting the fact of "sitting down" before you being targeting "standing up"? None of that is required.

Now, instead of doing anything about standing up, just let your attention be open and expansive in all directions (don't narrow down onto your body parts), and just-decide that your body will stand up: simply think "being-standing-up". And then don't interfere. Allow the experience of "my body standing up" to just arise and unfold in your awareness, by itself.

Some people constantly "re-assert" their current body position and then use effort to overcome it, and they do the same with thinking, and in particular they "concentrate" their attention on the target of what they are doing. None of this is actually required (in particular, you don't need to narrow-focus on your target in order to intend it and have it happen), and what it tends to do is "fix" you in your current state, and prevent it shifting - in the example, like you are intending "being-sat-down" and "being-stood-up" at the same time!

Q1: alright, i think I got the point, so how do we transfer that to 2 glasses? And by the way, how was this method discovered? i've been looking on google but there's only reddit threads, no other websites so im curious :p

In two ways. Firstly, when performing the exercise, simply perform the acts as described in the instructions, and don't "concentrate" or "focus" or in some way try to make anything happen. Secondly, in your everyday life work towards staying "open and spacious" and go about your tasks by just-deciding rather than "manually" moving yourself (body, thoughts, attention). The exercise itself, I put it together when someone posted a question over at /r/glitch_in_the_matrix asking whether it was possible to deliberately create a "glitch" type experience.

Q1: Got it! Thanks!
Yeah, but my point of the question, is how would someone discover the method, since lot of people on this reddit say it works im just curious why it is not famous out of reddit itself

Oh, I see. Well, it's just one example of that sort of thing, I suppose, and it probably doesn't make much sense out of context?

It's probably best described as an experiment rather than a method. Its underlying purpose really is to trigger an experience that encourages a questioning of your assumptions, and perhaps thinking along a particular direction about the "nature of experiencing". Without that larger idea backing it, the ability to have conversations like this about it in a forum, it probably isn't very valuable.

Q1: Gotcha, thank you once again!
Could I ask you to share your own experiences that have worked with 2Glasses (if not very personal) as how was it before, what you wanted to change, and how it changed and what else changed due to it?

You're welcome. I'll leave you to conduct your own experiments and check it out for yourself, but if you're interested: here is the original comment [POST: [EXPERIMENT] Glitch Generation Test, I Need Your Creative Ideas!]

...

*Q2: [There is no morality or judgement outside of yourself]
yes there is - me*

Hmm, you are not outside of yourself!

Q2: other people are because they are not directly me and do things I despise... judgement, see

But you are not "directly you" either. To despise them is simply to despise aspects of yourself, and for as long as you despise them, it'll persist...

*Q2: for as long as you despise them, it'll persist...
that's right, because by thinking about them, I am reinforcing that "pattern". so I have to "drop" them... but realistically, they're not going to just vanish; so there must be a need for a war or something
But you are not "directly you" either
this is still confusing to me [https://youtu.be/DyOxHTLE3EE]*

Drop "realistically" too, then...

POST: What happens to the other 'you's when you jump?

The content and links in the sidebar cover this, I think, but -

Although it's fun (or disturbing!) to contemplate, there are not any "other yous" in the sense of physically (in a separate space), simultaneously (in a parallel time) "happening" (unfolding in time). I'd suggest that the only thing that is "happening" is your 1st-person ongoing experience right now.

"Dimensions", as an (active?) metaphor, provide a way of conceiving of a discontinuous change in the content of that ongoing experience that breaks your usual narrative of the world as a "spatially-extended place unfolding in time". Other narratives might then seem more appropriate - for example, we might think of "the world" as a sort of toy box containing all possible patterns and facts and moments, from which we select our particular "private copy" experience of a world.

Q1: I rather like the "private copy" metaphor, it helps me grasp the whole idea of "patterning." The only thing I don't understand is how it can be "private" when our toolboxes seem so show the same pattern, and my patterns can influence your patterns. I'm sure you get this same question in its different forms very often, and I guess it can be boiled down to this: if objectivity doesn't exist, then why do our subjective experiences "sync up" so well?

There are a few ways to tackle this, but let's say: if objectivity doesn't exist, then subjectivity doesn't exist - there is just "experiencing". Therefore, our subjective experiences in fact don't "synch up" at all. Your current experience is the whole thing, you are being-a-world-from-the-perspective-of-a-person (and by "a world" we mean a particular shaping of the metaphorical eternal "infinite gloop").

The Hall of Records metaphor gives us one way to conceive of this. It essentially says: all perspectives exist, but the only thing that is ever "happening" is this experience, because "experiencing" == "happening". There is no "outside" to that. However, really, we have a problem here: that our thoughts about experience are themselves experiences, and so already formatted into pseudo-sensory object-based experience. We cannot therefore think about experience; it is already "too late". What we are talking about is "before" division and multiplicity. So, we might say that there is only one toolbox, not many, and only one experience, not many. Strictly speaking, given the above, we should say that there are not-many toolboxes, and not-many experiences. We literally can't conceive of this in the abstract, we only conceive of particular experiences, as experiences!

Although we can't think about it, we can directly attend to our experience and get an unmediated insight though. (Excuse some recycling here.) A silly little exercise illustrates this. We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the facts upon which all of experience is built. (Try it before reading the next paragraph!)

I anticipate what you discover is: there is no edge to your experience, and so there is just a sort of unbounded space of "awareness" rather than "an" or "the" awareness; you seem to be both everywhere and nowhere, you are unlocated and unbounded; the entire experience appears to be "made from" you, as in you-as-awareness rather than you-as-person; what you previously considered yourself to be is a thought of you, and that thought is located within you-as-awareness and is made from you-as-awareness.

Eventually - from this, the experiences you might generate from other exercises, and some contemplation - you conclude that the only inherent property of experience is being-aware, and that to talk of there being "other" subjective experiences or an objective world is not right or wrong, but meaningless. You can't "understand" this in terms of conceptualising it, but you can know it, directly.

I've spent my whole life using "subjectivity" basically as a synonym for "experience."

Me too, largely, which is why it's worth doing what we're doing now: just emphasising that it's a shorthand for "the subject" rather than it being a perspective that is embedded within an environment.

I'm imagining an Alex Grey painting with an infinite pattern of eyes embedded into the background, which alludes to the idea of awareness being an inherent property of all things.

A nice image. If the background is made completely from "eyes', then all objects which appear within it are also made from "eyes". Although, because that can suggest that one part of the background is "looking out" at another part, it's probably better so that it is made from "sensing" or "being". That way, we get the idea that the background doesn't go beyond itself, it simply experiences itself, in and as the shape that it has currently adopted. This is where we eventually come to the idea of calling it "awareness" and its only inherent property being being-aware.

However, it's really useful to come up with different visual images, like the one you suggest, for helping us grasp particular implications of this. So long as we bear in mind that the true situation is "non-dimensional", as it were, then we can't really go wrong.

At the core of reality I imagine a uniform, unbounded 3D grid ...

In some respects this is similar to The Infinite Grid metaphor, I suppose. These metaphors can be very useful for: a) conceiving of a structure which can be used to formulate intentions; b) providing a thinking framework to discuss certain experiences. It is important, though, to note that it is not "how things really are" - because there is no particular "now things really are" or "how things really work".

There is no stable underlying substrate within which we are operating, hence the "formatting" of your world experience at an abstract level is just as much a pattern as everything else. When we intend something, we not only intend that outcome, but we also implicitly intend the conceptual framework that was used to conceive of it. That is, that when you intend to go out into the garden, you are also implying the extended pattern of that intention, which involves apparent houses, gardens, a persistent environment, spatial extent, unfolding change, and so on.

So, every intention is a shift of the entire world! However, we tend to only intend things that are consistent with our current experience, and thus every time we go out into the garden, we further entrench this entire universe or dimension (that is: patterned state). What we are doing on this subreddit, what the exercises encourage, is intending an outcome which is not consistent with our current experience of "how things work", and thereby we reveal to ourselves that "how things work" is something we implicitly intend and which is within experience, rather than some stable independent landscape that we navigate across.

This node could be described by some as an "ego," a container for the awareness. Is this description compatible so far?

Well, the ego isn't a container for awareness. Awareness has no edges or boundaries, it is what everything else is "from", so it cannot be contained. What you think of as the ego is just a concept. In terms of what you actually experience, I'll be it's just an occasional thought that arises here and there, which you attribute to an ego. Again, what you are actually experiencing is being "awareness" with sensations, perceptions and thoughts arising within and as it.

The little four part investigation demonstrates to you this fact of experience. It is important, though, to actually do this, to attend to experience directly, rather than just think about it. Your thoughts about it won't get "behind" it, they will be just more experiences, deformations of your current experience - like rippling a pool of water that you are trying to perceive the surface of. Realising this, you discover the the "ego" is really a thought about an "ego", rather than an actual thing. It is a pattern of experience, nothing more. (I suggest.)

POST: A few questions.

I guess probably the best way to start, is to ponder:

- How, exactly, does the "law of attraction" work? (And what is the model of the world upon which it's based?)
- What are "you" and what is your relationship to "the world"?

As the sidebar says, "dimensions" are really just a concept or metaphor (as indeed is the concept of "reality"), one that is used to describe an experience and/or formulate an intention. It is not really "how things work" or "how things are". (In fact I'd suggest there is no "how things work", and "how things are" cannot be described because descriptions themselves are made from it.)

Ultimately, then, this is about generating experiences which lead one to contemplate the "nature of experiencing", and understand the relationship between experiences, intentions, and descriptions. And getting some desirable results along the way, for sure. The Two Glasses exercise, specifically, is really a structured approach to getting someone to shift state from one with "this" pattern as dominant, to one with "that" pattern as dominant - whilst making it relatively unlikely that they will counter-intend it afterwards, and in a way that naturally raises questions about causal relationships within experience.

POST: I've got a bit of a problem.

Q1: I am saddened that this subreddit seems so negative suddenly

Q2: It's the flood of all these new people. The whole "vibe" of the sub changed. There's no more teachers. And all the noobs are just relishing in their ignorance.

Q3: Imo "teacher" isn't the appropriate term.

Assuming that the core intentions of this sub are:

(a) to rise curiosity about the relationship between "I" and "the world" and subsequently between "experience" and "descriptions".

(b) Suggest tools to help individuals in their personal investigations.

What is lacking at this phase are more people willing to redirect "noob discussions" to the core theme. The modus operandi of /u/TriumphantGeorge is a good model.

My suggestion to make this task easier is to create a hypertext in the format of Question/Answer linking to previous discussions here. Maybe it could be done in a collaborative fashion utilizing a shared doc...

Indeed, those are the core themes - although they are usually best articulated as part of a dialogue, rather than a statement of intent I think, because the various terms tend to have different meanings for everyone. That's also why there isn't a basic Q&A/FAQ here. However, a wiki page linking to "historical discussions of note" may be a useful thing for us to introduce. Meanwhile, the number of subscribers and new interest probably now exceeds what is practical for a subreddit topic like this, and has for a while. In moderation terms, we've tended to let things breathe for a bit, then reel things back in. That is, allow some basic or repeat posts to stay for a while - because they often allow a strand of discussion to develop that is valuable even if the main post is not - and later remove ones that didn't flourish. But this does mean we suffer from waves of "incomer ignorance" dominating the sub sometimes, and perhaps we need to push back on that a bit more.

...

A1: Grow a pair sissy.

A2: I agree with you. I was sitting in front of the mirror bored for 40 minutes straight. OP is just afraid of the dark.

POST: Can you change yourself physically when you jump?

I would also like to know if I can change myself physically when you jump, but this comment is pointless so think of it like a bump.

The likely range of bodily change is often asked in rhyme,
The key you seek to make it sleek will come to you in time.

Soooooooo, yes?

[Come on, you gotta keep in the spirit of it!]

Dramatic shifts and bosom lifts mean lowering your defences,
Parts are moved and others soothed while detaching from the senses.

I would like to have clear answers, because I really don't want various types of cancers.

[That's better!]

The theory's said that results are lead by the thoughts we hold in mind,
But the strength of these asks commitment, please, which is difficult to find.

Commitment is something I am not familiar with, but I could do it for this, now stop rhyming please and help me jump into the abyss.

[Very good.]

I've never had cause to dabble myself in this - except that I did accidentally 'keep things going in the right direction' when I was growing up, unwittingly. But the process is the same for all this stuff: Enter a state of detachment (so that you are not "holding onto" present patterns, and they fade) and will the desired change (triggering the desired pattern, to intensity) without using any effort. It's a bit more difficult, I think, to let go of the body, so it's easier to will it in the future - and if there's some 'token action' you could take in that direction, that can be helpful.

How can you will change without using any effort

I think of it like "remembering". Do you use effort to remember something? It's like that. Will is how you actually accomplish things; everything else is an effect. It's hard to describe. I mean, how do you see or hear? You just do it. But it's the difference between having a 'technique' and it working or not working. It's sort of a commitment to something being a fact. Here's a little experiment which can give you the experience: Get a friend and challenge them to an arm-wrestle. Do this twice.

- On the first attempt, use all your muscle power to attempt to win the arm wrestle, as you normally would.
- On the second attempt, withdraw your 'presence' from your arm and simply "strongly decide" that you are going to win the arm-wrestle. Now, resist the urge to interfere - leave your arm alone and simply let your arm do the winning for you.

That "strongly deciding" is the willing. It is that which brings about the result. In this example, you can will muscular movement or will the result. When doing these types of things we want to use the second sort. And so it is effortless.

what is a token action?

A 'token action' is just something which you can pass off as the 'cause'. For instance, if you wanted to lose weight you might, having willed, go jogging once a week and eat an extra apple. (In the arm-wrestling example, 'muscular trying' is a token action which actually gets in the way of the result.)

POST: So...could every person that you talk to in your life actually have their consciousness in a

different dimension?

Today's Conundrum - Nobody is looking out of the eyes that look at you, except for you. If you pay close attention, you'll realise that even you are not looking out of your own eyes.

This has always been my assumption- we live in our own worlds

Yes, effectively we are each living in our own patterned "dream-space". When we "jump" we are letting go of some world-patterns, allowing them to shift according to our intention.

Aside - This sometimes leads people to worry about "other people", but the answer is that you are not a person either - you are a conscious perspective, in which the "dream-world" appears. And so is everyone else (if you need to believe in "elses"). It's best to just say "it all works out in the end; everyone experiences the version of themselves they choose to".

Thats seems pretty limited-Im also a person and youre a people. Its part of how this works.

Well, it's optional but - It's better to say you are experiencing being-a-person or a "person perspective". It seems like a detail, but things make a whole lot more sense if you take this approach. Not just "jumping". Search for the "person" you assume you are, and you won't find it. You will, however, find transient sensations, thoughts and perceptions in an "open aware space". The person you seem to be is as much the content of your world as the rest of the environment.

That's a lot of robot talk to skirt that it's People not- animals or robots or anything else that has the ability to surf the meta fiction as with jumping. It's the Person, human that bridges mortality & immortality - that's pretty fucking important. With heady robot talk about consciousness you miss the most important part

Hmm, so what is "the most important part"?

The Human.

Okay, interesting point. If you are experience something, you can't be that something, I suggest. But this depends on what you mean by "human". If you mean "human" as in, a particular formatting of mind but independent of the body and thought, then I might agree with you. Human experience is a filtering of potential experience. If that wasn't the case, we wouldn't be able to do "jumping" and the like. In fact, the whole jumping process is precisely about detaching from that formatting and letting it shift. You let go of "being human" to, briefly, be nearer to raw unformatted consciousness and more responsive to intention. You die and resurrect.

Without that there is no subjective experience to experience.

Very true. And if you pay super-close-attention, you might realise that your subjective experience is constantly disappearing and re-emerging, like the gap between frames in a movie. At best, we are half-human in our experience. But since time can't be measured against anything within those gaps, so each gap in a way lasts forever, maybe we are barely human at all... And who knows what you become in those unremembered experiences between your "human" moments...

Yikes. Rocks have consciousness. The universe is aware.

Nah, rocks don't have consciousness. Nothing "has" consciousness, I'd say. I wouldn't even say "the universe is aware".

Well there are plenty of people to disagree with you on that so I'll leave you there. We'l have to agree to disagree.

Just to be clear, lest I leave a confusion: I'm not saying you are not conscious. I'm saying that consciousness must be something you "are" rather than "have". What you then seem to be is the shape you have taken on, as consciousness. My "wouldn't say the universe is aware" statement is misleading in this way. Better to say "is awareness" and "has awareness of its form". Anyway, thanks for the exchange.

...

Can a Mantra be a Metaphor?

Good question! Some thoughts: If we abstract these terms out into "patterns" then, effectively yes. To say a word is to trigger its associated patterns. Meanwhile, a metaphor is simply a named set of overlapping relationships (patterns), connected and associated with an unnamed set of overlapping relationships (patterns). To say the word "owl" is to trigger the associated patterns of "birds", "wings", "big eyes", "tree branches", "Blade Runner Voight-Kampff Test", "Rachael", "night-time", etc. To think-about an owl is to do the same.

On archetypes

Gods and Goddesses, owls and archetypes, they are all just triggers for pre-existing extended patterns which cannot be encapsulated in a word or an image, but can be triggered or intensified by them. All possible patterns are here, now, in your experience - it's just that some are more intensely activated than others. To feel better (simplistically speaking) you want to allow the "bad feeling" to fade and a "good feeling" to become more intense. How to do? "Detach" from your current experience and "allow" it to shift; trigger a pattern which implies the desired state. Literally, you are a wide-open perceptual space with some experiential patterns more intense than others. You don't "heal" so much as "allow experience to apparently shift". More accurately: you can't change anything, you can only let the present pattern dim and intensify an alternative pattern by "recalling" it.

POST: What's the point of the Dimensional ID 982 if an infinite amount of other dimensions could have the same number on their sidebar? Why doesn't everyone pick the own ID for their original dimension?

The ID is there for fun really. It's part of the mythology.

Even if people were to pick their own personal ID, there's no reason why it would change just because other changes have occurred. There of course an infinite amount of different types of experiences in which the ID is still that number.

Really I'm referring to "mythology" in its looser sense:

"Mythology can refer to the collected myths of a group of people—their body of stories which they tell to explain nature, history, and customs"

The concept of using some sort of "Universe ID" or anchor to identify shifts was one of the early ideas in dimensional jumping, so it's part of the shared history of the subreddit. If you think about it though it doesn't really work as a reliable reference (why should that number necessarily change just because other things have changed?) so it's really just part of the fun rather than something inherent or useful in the approach. If it does change however, then you will know for sure that things have shifted, right?

POST: So can i jump without the whole "candle n mirror @ night"?

The point is to get yourself into a detached state, released from holding onto the current sensory experience. Check out the other methods post linked on the sidebar - e.g. Neville Goddard approach of entering deep relaxation, etc. You don't even need the timing, although there's something about the quietness of late night, and it feels "special" in a way that helps. The trick to letting go is to let go of your attention. People understand letting go of the body and thought, but they leave their attention narrowed. Free your attention also. Then, once you've settled out, you can begin, focusing your will. Check out the couple of (free) books referred to in the Neville Goddard post. His approach is probably the most accessible, next to the stripped down version. Here's a good exercise to begin doing (there's a more advanced one here):

Daily Releasing Exercise

- Twice a day, 10 minutes, lie down in the constructive rest position. On the floor, feet flat, knees up, head supported by a couple of books, hands resting on your lower torso.
- Completely let go to gravity. Give up totally, play dead.
- If your body moves or thoughts come up, let them be. Just let them release without interference.
- If you find your attention becomes focused on something, the same: just let go of your attention. Give up, again.
- At the end of the session (don't worry about exact timing), decide to get up, but don't make any movement. Wait until your body moves by itself. This won't happen for a while, but during one session, it will.
- In general, resist the urge to interfere with your body and mind, to push it along. Settle back and let it run at its own pace.

POST: Has there been any thought given to the idea that you are consciously manipulating reality, rather than jumping to a different one? Is that question semantic?

A1: I think that quite rightly sums up the issue. The way I like to express it is that you do not exist in multiple dimensions but rather multiple dimensions exist in you. If you think of all possible worlds as a probability wave, it is a matter of conciousness "collapsing" the wave into multiple realities. Much like the old idea of our subjective reality being a dream and we have the ability to change the dream.

Right! I'm not quite so keen on "wavefunction collapsing" because it's maybe not a great interpretation even for physics (it implies an event), but the idea that you are a conscious space and all possible experiential/factual/logical patterns are by implication if not in fact latent within you, like memories waiting to be triggered, is pretty close as metaphors go.

Q: So do you think humans have 'incarnations' in lower and higher dimensions simultaneously? Could I dimensional jump my consciousness 'up' a dimension instead of 'left or right'?

All there is, is experiences, and all experiences arise in your "perceptual space". In a dream of walking across a field, do you go anywhere? What if you had a dream about exploring other dimensions? No, in all cases what you get is... more dream. When you wake up in the morning, again... more dream. You might consider that you are only dreaming of waking up.

(To illustrate this, try out the little experiment in the middle of this post [Outside: The Dreaming Game].)

POST: Noob here. Am I too negative to try this DJ?

Right..the only reason I would want to DJ would be to fix the negativity, ha. So, if I were to get in the right mindset to do it, I wouldn't want to anyway. I will just have to figure something else out, but it was just a thought. Thanks for your reply.

Yeah, if you "defocus" yourself a bit, the rest of your mind is going to snap to the same thing! So messing around with mirrors seems like a bad idea.

Possible suggestions: You should concentrate on something more general: bringing into mind scenes of what you'd like to experience, vividly and with the feeling of how you would feel, as if you were experiencing it now, in the 1st-person. That alone will make a big difference to you. Even just because it's fun and feels good. Although outside random events might act to budge you out of negativity, the longer it goes on the more the world will have lost that random factor, and settled into your attitude along with you. You are going to have to "shape-shift" yourself!

Think of it as having ended up with a slouched, weeakposture. You can wait for something to bump into you, or pull you up, but that might be a long wait. The best solution is to shape-shift yourself, take on the form of upright posture and power. It might be worth reading the Neville Goddard version, described best in The Law and the Promise (see links in that post), for inspiration.

POST: trying tonight

Work on summoning the feeling of "how you would feel if you were as you want to be". This will help more generally.

POST: Too scared to jump.

Try other methods. They all amount to: entering a state of sensory detachment, and allowing a shift towards some intended state. No matter what you have to "let go" in some way, but some are a little more pleasant if you don't like the morning ritual bit!

Have you ever seen those isolation tanks? I wonder if those can be used in jumping. I don't see why not.

Floatation tanks? I've had a few sessions in those: very relaxing. It was before I started thinking about these things though. Potentially it could be ideal. The more you feel "totally supported" the more you feel comfortable in removing attention from your body sensations (that's why maybe lying on the floor is better than lying on the bed is better than standing up, for this).

TriumphantGeorge Compendium - Part 15

POST: Seriously tripped out. I SWEAR there were at least 65,000 subscribers to this subreddit. I watched the number climb for quite a while too. WTF

AI: That is an improvement then, imagine 65,000 people posting this type of drama daily.

Hmm.

POST: Misunderstandings

/u/TriumphantGeorge states that "dimension jumping" is actually just a metaphor. It's all been a metaphor. I don't mean to shoot anyone down with this. If you believe you are actually jumping between dimensions and shifting the OBJECTIVE REALITY, go for it, I'm not going to stop you

However, to say it is "just" a metaphor is also misleading. That implies that metaphors are lessers things, that they are not "real" like other things which are "objective". The sense in which "dimensional jumping" is just a metaphor is the same sense in which "objective reality" is just a metaphor. To highlight:

It's a place to change your subjective perception of reality, meanwhile the objective one remains unchanged.

I have never encountered an "objective perception" of reality. In fact, strictly speaking, I'm not sure I can say that I have ever experienced a "reality" at all. The context of the statement would be all important. It is also worth considering whether there is truly a difference between having an experience that "really" happened and having one "as if" something happened. The experience certainly happened; the explanation of that experience is another thing. The explanation is in fact itself another experience: "the experience of thinking about an experience". Explanations are never "what really happened", you might say. Unless perhaps one thinks that the world is actually made from explanations! (Although: there is a sense in which that might be viewed as an accurate statement, but not by the straightforward interpretation of it.)

Anyway, you get the idea.

The sidebar text and the introduction already give the perspective to take (and there's no risk of posts or my comments being deleted; the idea behind the subreddit is that a lot of the content will be in the evolving discussion taking place within the comments). From there, the intention is that people do some exercises, contemplate the results and their ongoing experience more generally. There is, in fact, probably not much point trying to work out what this "really is" without engaging with that. It can lead to one simply creating more "castles in the sky" (self-consistent conceptual frameworks which "make sense" within themselves, but do not actually connect do the the topic of direct experience - that is, they are "conceptually true" only). Regardless, one needs to be really picky when it comes to how we use our familiar concepts and ideas here; because perhaps familiarity is the only thing making them seem valid. Some good and reasonably accessible reading related to that last point from the perspective of science and philosophy, again to be viewed as thought-provoking rather than prescriptive:

- What's bad about this habit - N David Mermin, on the reification of abstractions.
- The mental universe - Richard Conn Henry in Nature, covering similar ground.
- Scientific method: Defend the integrity of physics - George Ellis on, essentially, science vs conceptualising vs philosophy.
- A Private View of Quantum Reality - Christopher Fuchs on interpretation, probability, the "objective world" container concept, and more. (See also the related Nature article, Physics: Qbism puts the scientist back into science, which is also interesting for the point at which the author resists the implications of his model.)

1] It's obviously worth asking what "dimensional jumping" and "objective reality" are metaphors of or for. One answer: they are metaphors for the patterning of our experience; they are possible "as if" perspectives on them. Of course, "patterning" is itself a metaphor! However, it perhaps benefits from having less in the way of hidden assumptions between the direct experience and the description - plus it self-declares as a metaphor rather than claiming to be "what is really happening".

I don't believe I'm being that much of a poison.

Hopefully, I never seemed to suggest that you were. That's not the spirit in which I responded, which was: to clarify what was meant when I said "it is a metaphor" (my "own words", just as you say) and to elucidate the underlying approach of the subreddit. Your post was a great seed for kicking off a discussion about exactly that.

I just wanted to highlight that for newer people to this sub, so they can decide for themselves if they believe it or not.

Indeed. But it's hopefully not a matter of people "believing" something (or not) based on what they read. As the sidebar tries to underline - and it really does give you all you need to get started - it's about conducting a personal investigation and then drawing your own conclusions. In fact, "belief" is probably too strong a word: people don't believe in an "objective world", they just never really examined the idea one way or another, nor paid much attention to the structure of their own perception. I'm not even sure that most people truly understand what is actually meant by a phrase like "objective reality", beyond the vague background assumption that what they supposedly are is a person-object located within some sort of place-environment. Most people, I would suggest, have never truly examined - intellectually or practically - their assumptions about their ongoing experience in any way. And then, if prompted to, they mostly go straight into thinking-about it at a surface level, rather than attending to it. Most don't even know what attending-to even is. This tends to result in wandering around the same ideas in a circle.

solipsism is by definition unfalsifiable

That's not necessarily the case, I'd suggest. It is true that there can be no content-based falsification of solipsism. But, it might be possible to notice something about your ongoing experience, its context, which suggests that ideas like solipsism are meaningless - that they do not apply. They are "not even wrong" as a description of one's situation. Similarly, the idea of an "objective world". That is not to say that they are not useful ideas, though. Recognising that these ideas (those, and "atoms", "particles", "waves", and so on) constitute "effective theories" rather than explanations in the sense of behind-the-scenes truth, is probably quite important. (People often pay lipservice to this, but not much more than that, especially over the last few decades where increasingly descriptions are taken as literally true, actual "things".) This is one of the senses in which the "objective world" and "dimensional jumping" are both metaphors.

To emphasise, though: this subreddit is not about believing anything. However, it might be about **examining - everything**.

And "belief" isn't that strong of a word to describe the situation.

I think I'm just keen to have a more specific use of the word "belief" when discussing this particular topic. Certainly, as you say, the everyday use covers all those situations you allude to. But here, when dealing with a deliberate examination of the nature of experience, it's useful to highlight when something is more of an unexamined "assumption" than an explicit "belief". It can seem nitpicky, but making distinctions like that can help when digging deeper, I feel.

When all is said and done, this boils down to solipsism vs. realism

I personally don't think that's the case, and for a reason: you can observe something about your direct experience which simultaneously re-contextualises "realism" and makes untenable the common version of "solipsism". Loosely speaking, we end up with: in the former case, there is no place for a "real world" to be; in the latter case, there is no place for a countable "object" to be and hence nothing for experience to "belong" to. Now, if one has no new information - no additional experiences to add to one's

memories-to-date; no fresh container concept either - then certainly it seems that we are left with an intellectual choice between "realism" or "solipsism". This is why there is an encouragement to conduct certain experiments, and why the sidebar calls them "exercises" rather than, say, "methods". (And to really ponder what a "description" actually is.)

As a side note I'd like to applaud you for keeping this discussion civil and well-meaning

Likewise. Hopefully the subreddit is all about encouraging collaborative discussion, an ongoing conversation - albeit one guided by a certain approach. That "certain approach" though, is based on engaging with ideas and beliefs as ideas, rather than fighting to "win" exchanges. After all, who knows where the next interesting or useful angle may come from? Certainly, it's unlikely that it will arise from people just viewing everything in exactly the same way and nodding their heads in precise agreement! (Or fighting in such a way as nothing is gained by anyone.)

The exercises themselves, however, are biased in favor of confirming one side over the other.

I don't think so? There is no content within the exercises themselves. And they are definitely not intended to involve a selection between two viewpoints, as such. Instead, quite possibly the conclusion would be that both viewpoints belong to a certain "type", and that the "type" is itself something to be questioned.

They can be explained through other means that don't require this.

The issue, here, is that the exact nature of "explanations" is one of the things under examination.

But I do think that some more clarification was needed for people to decide if this really is the subreddit and ideology for them

Ultimately, although it doesn't explicitly state this, it's sort of about being anti-ideology. (Although not just for the sake of it, of course.) It not "selling" a viewpoint. Rather, it's pushing a critical view of all descriptions of experience, as a category, with an encouragement to do a couple of little exercises which highlight this, directly (because there's no point in just thinking about this within any particular conceptual framework; you just go round in circles). In other words, the clarification comes from the participation, via personal investigation. There's not really any other way to do so that sticks; it's just more thoughts otherwise. The final context of it is non-conceptual (it can't be resolved into mental objects related within a representation space), which obviously poses a problem. None of this is particularly new, though, of course. The idea of "believing in" concepts and reifying them versus direct experience is a relatively new thing, I'd say - and has been retro-fitted onto past figures who explicitly criticised such an approach. For example, the key physicists of the early 20th century, and so on. As philosophy's prominence in physics diminished, and science became more like piecewise engineering built on prior conceptual platforms, we're left in quite an odd moment when it comes to the idea of "the real". Which is an interesting thing to explore, I think - hence all this.

Since the subreddit is ultimately non-ideological, the main battle is to prevent any particular "understanding" from becoming dominant to the exclusion of others (I think /u/Hooded_Rat gave quite a nice response along these lines). That would be what would constitute a "poisoning of the well". You're right that the internet is tricky when it comes to this. Now, it is true that not all newcomers to the discussion arrive at the same "level" - but that is fine, I think. With a topic such as this, intellectual elitism is quickly exposed, whilst ignorance is revealed as opportunity. From experience, though, you can't really just tell people "this is how it is". You really have to engage with them on their own terms. Fortunately, as one of the moderators, I have some influence over that! Plus we take the approach of "moderation via contribution", which hopefully ensures anything that gains momentum does not continue for long without coming under appropriate scrutiny. As a subreddit somewhat built on being against taking things on faith, though, we are generally in a good position here - even if Tom Cruise does show up and jumps on the subreddit sofa...

(Probably the real enemy for us is the casual comment declaring that "I read somewhere that this or that is the answer to your question", followed by nonsense! Corrective responses are time-consuming.)

Anyway, it is good when people (such as yourself) from all different perspectives are willing to engage, since it's not really about being "right" so much as digging into the construction and implications of this or that view (and its relationship to experience).

POST: Questions for Mr. TriumphantGeorge about reality tunnels, non-dual doctrines, books and movies.

(Replying as recently requested!)

First, on the reading recommendations front, I'd probably point you to this reading list conversation we had quite a while back.

[TG COMMENT]

See also, perhaps:

- The essays and articles linked at the end of this comment [POST: Misunderstandings];
- The partial reading list at /r/oneirosophy;
- On the entertainment side, the viewing and reading thread at /r/glitch_in_the_matrix.

And some things which may or may not be in those lists, off the top of my head and in no particular order, around the topic:

- Three Dialogues - George Berkeley
- Presence Vol I & II - Rupert Spira
- An Introduction to Awareness - James M Corrigan
- SSOTBME: An Essay on Magic - Ramsey Dukes
- Against Method - Paul Feyerabend
- What is Zen? - Alan Watts
- Head Off Stress - Douglas Harding
- Focusing - Eugene Gendlin
- The Open-Focus Brain - Les Fehmi
- How You Stand, How You Move, How You Live - Missy Vineyard
- Zen Body-Being - Peter Ralston
- The Mechanism of Mind - Edward de Bono
- Wholeness and the Implicate Order - David Bohm
- MUI and Conscious Realism - Donald Hoffman
- The Camel Rides Again - Alan Chapman
- The Meditator's Handbook - David Fontana
- The Michael Chekhov Handbook: For The Actor - Lenard Petit
- The Tibetan Yogas of Dream and Sleep - Tenzin Wangyal Rinpoche
- Lucid Dreaming: Gateway to the Inner Self - Robert Waggoner
- The Lucid Dreamer - Malcolm Godwin
- The Serial Universe - JW Dunne
- The End of Time - Julian Barbour

Meanwhile, an archive of Neville Goddard's books and transcripts can be found here, although the two main ones for getting a handle on his thinking are probably Awakened Imagination and Imagination Creates Reality.

[END OF TG COMMENT]

I don't really have any primary favourite that captures the feel of the subject, but all these have aspects of it. In terms of fiction and the authors your mentioned, for Ballard, The Unlimited Dream Company is nearest for me, but also things like The Drowned World less directly; for Philip K Dick, it's Ubik or The Mind's Eye more straightforwardly, but Flow My Tears, the Policeman Said captures it better.

Those experiences made me realize that this "material" world is an echo of the "imaginal" world.

I feel that if we take a step back from that, and instead view all experiences as being at the same level, we can short-circuit some of the usual paths of thinking here. So, no one aspect of experience is an echo of anything else; they are just aspects of your current "state". One moment or strand does not cause another; rather they are part of the same "place". In this way, we sidestep the concepts of "belief" or "projection", both of which imply some sort of separation between "you" and "world" plus some sort of intermediary mechanism, and end up with a description based around you as that-which-is-aware sort of "taking on the shape of" states of experience, by a shifting of self. Basically, a "patterning" of you-as-awareness. Loosely speaking, that corresponds to something along the lines of:

- What you truly are is a non-material "material" whose only inherent property is being-aware (or "awareness"), and which "takes on the shape of" states of experience. Right now, you-as-awareness is "patterned" as a state which corresponds to the experience of apparently being (an experience "as if" you were; consistent with a description of being) a person-object located within a world-place. However, by attending directly to one's ongoing experience, one can recognise that the context of our experiences in general does not correspond to any of the descriptions we have about the content of specific experience. (Something like that, anyway.)

This, I'd say, is effectively another depiction of "non-duality", but employing metaphors that are stripped down, attempting to avoid old associations whose original meanings have become corrupted (e.g. "god" or even "consciousness"), or getting ensnared in modern metaphors that don't quite fit (e.g. "simulations" or misused "quantum states"). In the end, thought, as with those descriptions, it becomes about pointing out and avoiding saying things that are "wrong", rather than being able to say the thing that is "right".

POST: Witch needs help re: unintended consequences

Can you please just help me understand why no one here promotes using safety clauses.

We have had discussions in the past about being specific, particularly when someone has come up with a "monkey paw" type hypothesis. Ultimately, the generalised version of how to view this here would probably be that it's best to view things as a "dumb patterning system". That is, there is no interpretation of your target outcome taking place, there is in intermediary entity or intelligence. Rather, you are literally and directly increasing the prominence of the fact/pattern that you are intending, and the rest of the "landscape" of your world-definition is simply being deformed as a side-effect.

And so, yes, being specific is generally helpful, or appending some sort of notion of "in a way that benefits everyone" or whatever. One strategy someone came up with for the Two Glasses exercise was to add an asterisk (" * ") beside the labels, as if indicating an internal footnote, and just-decide that doing so meant that the manner of the outcome would be beneficial in a broader sense. It's worth noting something else here: that is, that the way some of these exercises were designed, was that it's not so much about the actual words you write, rather it's the state they represent or are a handle on.

For example, in the Two Glasses, you are not writing a description of your outcome, you are summoning the outcome in your mind and then retrieving a "handle" onto that, which you then write onto the label, linking it to the state. If you are doing that with full attention, then you are inherently specifying your outcome state in a way that is more complete than simply words or other symbols. So, there's a bit more to consider here, potentially, than just the general notion of "safety clauses". And obviously there's a whole lot of stuff to unpack about concepts like "forces of the universe" and so on. The approach here is (amongst other things) aimed at unpacking and defusing such patterns, and in the process I'd say that there's less to worry about as regards unintended outcomes from assumptions, since intentions are more "direct". Of course, almost all of an outcome could be said to "unintended", strictly speaking. (As in: not specified. Because if you intend an outcome - say, passing an exam - then "passing an exam" is just one little fact, but the whole landscape of your state was deformed to accommodate it. In that way, almost all of the outcome or result, almost all of your landscape, was not deliberate.)

POST: Two Glasses - A Cautionary Tale

See recent discussion on "unintended consequences" [POST: Witch needs help re: unintended consequences], too, and the idea of "safety clauses". It's important to be careful to not get too hung up on any "monkey paw" type notions here - that is, the idea that there is some sort of payment extracted for having an intentional outcome arise. What you say here isn't a bad way to phrase it:

Cause it's all about the "path of least resistance".

However - it's not necessarily the "path of least resistance" in terms of how you yourself would narrate or conceive of your situation. The way in which your outcomes (seem to) arise isn't necessarily dictated by "story" type logic; it's more like dream or "patterning" type logic. The whole thing is more like a direct "dumb patterning system". Which is to say:

If you intend an outcome, then it's like you have asserted a particular fact to be true: the fact of this-outcome at that-moment. The two certainties, right then, are that this-moment is true (because you are experiencing it) and that that-moment is true (because you are "pseudo-experiencing" it by defining it). If we conceive of our state (the set of all facts and the sequence of "sensory moments" which are implied by them) as a sort of "landscape", then it's like you have defined two particular landscape features, - like mountains or valleys or trees or rocks - one "now" and one "then". And so, just from the fact that the landscape is continuous, the intermediary ground that is the moments between "now" and "then" are defined implicitly. This is "dumb", or happens "stupidly", since there is no calculation or intelligence involved, any more than pulling on one side of a blanket results in a calculation which reforms all the folds and creases in the material. And the way in which the blanket reshapes does not necessarily correspond to any narrative we have about the current set of folds. That is, the rules of "folds in blankets" do not necessarily match up with the rules of "stories about pictures made from folds".

All of which leads to: yes, we might say that outcomes arise by the "path of least resistance", but the sort of "path" we are talking about doesn't necessarily correspond to our conception of what a "path" would be. In fact, the rules of "folds in blankets" would be "before" conceptualisation; they are literally unthinkable. So there's not much point in worry about that (because you wouldn't actually be worry about the thing you should be worrying about, anyway). The "story path" of an outcome really only an observation you make in retrospect, when it's too late. Fortunately, though, all of this is easily solved. If our worry is that the "outcome fact" will bring with it circumstances which are unappealing to us, we can simply include within our definition of the "outcome fact" that it will be appealing to us. From the other discussion:

And so, yes, being specific is generally helpful, or appending some sort of notion of "in a way that benefits everyone" or whatever. One strategy someone came up with for the Two Glasses exercise was to add an asterisk (" [*] ") beside the labels, as if indicating an internal footnote, and just-decide that doing so meant that the manner of the outcome would be beneficial in a broader sense.

The takeaway of all of this, I'd say, is the realisation that there is no intermediary between you and the intention and the outcome. They are all identical: intending is basically a "reshaping" of yourself into a new state, by yourself. The more specific you are, the more specific your subsequent experience. If you are not specific, then the intention is effectively "auto-completed" via triggering of the extended pattern of your intention (that is, simply due to its "dumb" incorporation into features of the current state or landscape at the time). Importantly, there is no "universe" or other entity interpreting requests or whatever, or sending you messages. Although you could intend to have experiences "as if" that were true, of course - but you would still be doing so directly.

Additional thought - It's also worth noting that the correct attitude isn't really: "if I intend something, then what if a bad thing happens as an unintended consequence?". Because if you never intend anything, you are not actually avoiding unintended consequences. Rather, your entire experience is an "unintended consequence"! You are

deciding to accept however the "landscape" happens to have ended up by this point. So I suppose it's really about a transition towards taking responsibility for your experience, rather than not. And part of that is to understand and accept the limitations of knowledge as regards experiential content. There is an inherent "mystery" here: you can't pre-experience your experiences, and they aren't really "experiences" until you have experienced them.

[“there is no intermediary between you and the intention and the outcome.”] If we all had our “houses in order”, I would agree.

I think it applies regardless, and that's actually partly what's being said by it. To muse on that for a bit:

What I mean here is, that there's never a structural or active intermediary; there are no levels. The lack of order in your "house", is just a part of your current state, at the same level as any other pattern. The only thing there is to change, is the patterning of your state, directly (with no intermediary), even when in terms of a particular conceptual model that pattern would be described "as if" it were some sort of boundary or entity. Someone might, say, describe their process as "sending a message to god", and have outcomes consistent with there being a god. What "really" happened was that they shifted their state such that "outcome" was overlaid onto their existing "fact-pattern landscape" - and "outcome" was structured in terms of the pattern "god" and "message" and "response". The intention for the outcome was also, implicitly an intention for a "god message" experience. The subsequent "outcome-experience" then arises with content "as if" these things existed as intermediaries. The "outcome" is incorporated into existing patterning; a deformation of the existing overall pattern, and the "outcome" itself is defined in terms of a particular patterning. So at the fundamental level of "you-as-awareness in a patterned state", there is no intermediary, simply because there are fundamentally no "parts", just one "landscape" (you, in a particular "shape"). The state of your "house" is identical with the state of you, and there's nothing outside of that, hence nowhere for intermediaries to be. Hence "dumb patterning system" and all change being "direct". Or: it's patterns all the way down, and there isn't a "down" really, because "down" is a pattern too...

However, I've noticed you don't really discuss belief systems and definitions.

Hmm. So, what would you say a "belief system" is?

I feel that as as concepts, "beliefs" and "belief systems" can be a bit tricky, they are sort of quite hand-waving notions. There's this lack of clarity between "believing" or "belief systems" as an experience, as content of thought for example, and as the "meta" structuring or context of one's experience, what we've been calling our "state". In the view we've been exploring about, I'm not sure that the concepts are needed. Would we just be including them again from familiarity, from habit? In what sense do we actually experience a "belief" as such? And is it perhaps a partial idea which arose from a different model, an idea which doesn't translate easily or usefully?

Yes, the patterning system is dumb and it's steered by an even dumber set of generally unchecked notions about "life, the universe and everything".

Following on from the last bit, I think we have to make a distinction, perhaps, between "notions" as something one experiences thinking or inferring are at the root of thinking, versus the actual structuring of our experience. There's a hidden assumption here, perhaps, which is: that the format of our thoughts corresponds in type to the format of our state. That is, that descriptions somehow get "behind" experience, when in fact descriptions are themselves just further experiences, at the same level: the experience of "thinking about [a concept called] experience". There is no "behind the scenes".

Am I saying one should be afraid to explore their own mind/dreamscape?

Only in the same sense that one would be scared to explore their own thoughts, I suppose!

I'm saying one should... have a decent grip on how their own mind works, why they want what they want...

I definitely agree that it's quite fundamental to explore one's current state, and from that proceed accordingly. No matter what, though, you can only do this by actually experiencing your state. That can be in thought ("feeling out" your landscape in direct contemplation) or in the main strand (your ongoing "sensory" experience). So it's a funny sort of thing, that there is no "outside" position one can take. There's no way to "do something and then experience selected patterns", because the way that you select the patterns is itself by implicitly selecting patterns. So you are always exploring your current state, in fact!

The choice you make, though, is whether to intensify (increase the relative contribution of) a particular pattern, once you have unpacked it in some form or other (as a thought or as a main strand). So, it's all a bit like a rippling of self? Unfolding and refolding different aspects, electing to keep some aspects unfolded and contributing after having encountered them in our investigations, others less so. The main thing being that we can't actually "pre-decide" that we want a particular pattern in advance - we have to experience it in some way before it is available to us to choose to persist it or not.

...

Well, we're basically in agreement throughout; it's mostly terminology. As with a lot of these conversations, half of what we're doing is digging into terms to make sure we mean the same things by them - so we can then confirm we were agreeing anyway. I'd only pick up on this bit:

[Hence "dumb patterning system" and all change being "direct"] I'm simply pointing out that it's something most people will never get to truly experience for themselves.

In terms of what the description is pointing to, though, all experiences are that experience, and all intentional change is that. The extent of change (how unusual it is in comparison with the everyday-world description) doesn't matter; that would be a difference in specific content, not in type. And:

For me, descriptions and definitions sort of generate and organize experiences while, indeed, being experiences (patterns) themselves.

I'd clarify this and say that if an intention is structured in terms of a description or conceptual framework, then it could be said that the description "generates and organises" experiences. That's the difference between a description as an "experience of thinking about something" and a description as "a shaper of experience". (Now, I would agree that there's some deformation that can occur just by thinking about a description, but it's relatively negligible, might lead to broad synchronicity.)

This is where we get into the idea of extended patterns and meaning, and the view that there really is only one continuous overall pattern or shape, consisting of all possible patterns; there are no "parts". Each intentional pattern, then, essentially implies a whole world, and intending is therefore a shift of the entire world-pattern. This doesn't involve explicit formulation. To be less vague, if you kneel down and pray, then that act already has a full meaning and implied structure beyond simply the request, which is then part of the extended pattern of the intention - regardless of what you think about it, or whether you have thought about it. Now, for that example there is some overlap with the idea of "belief systems" I suppose, but:

More abstractly, even just conceiving of a desire in terms of an object, already implies a certain structure to the "format" of the world (a "place", spatially-extended and unfolding in time, and so on) which in turn implies a certain structure to the resulting experience. And so, the intention for the object is also in effect an intention of a "place"-type world, and "place"-type experiences, since the "meaning" of the intentional pattern is its extended pattern in those terms.

POST: a question to Triumphant_George

How did this subreddit start? What were your first encounters with dimensional jumping and how did you discover your methods?

Korrin85 started the subreddit based on posts you can find linked in the introduction post. I'd been following the larger context of this sort of thing for quite a while, Reddit-wise with contributions over at /r/oneirosophy and /r/glitch_in_the_matrix and so on (some links to posts there in the introduction, too). I then did some posts here, and was invited to become mod, re-organised and styled things up a little. The concept for the subreddit, beyond its initial "mirrors and dimensions" seed, has become, loosely, to encourage experimentation with, and investigation and exploration of, the "meta" aspect of such things - the context to the content - perhaps by, somewhat ironically, using further abstraction to connect them to direct experience. And so on.

The Two Glasses Exercise was originally devised in response to a question asked at /r/glitch_in_the_matrix in summer last year about deliberately creating glitches in one's experience. This and subsequent material was based on the ideas of "patterning" and "active metaphors" and the notion of exploring "the nature of experience" and "the nature of descriptions".

...

Yeah, I quite like the idea that people's "here's my experience" posts are a starting point and the value is then in the ongoing conversation that they provoke - rather than having declarative official posts or whatever. The sidebar text and the introduction are sufficient for that, I think, to provide a jumping off point. (After which I'm just a slightly verbose contributor who also happens to intervene occasionally to keep things civilised and on topic.)

Without a fairly solid "method" for substantially increasing the effectiveness of calling potentialities into actuality...

But this is itself the problem, perhaps. The continual search for a "the" method is a mistake. Anything that is in sensory experience - that is, a series of actions, the experience of performing a "technique" - is itself a result. Methods aren't causal, at least not directly; they are simply the leveraging of a pre-existing pattern or two. The actual cause is "intention" (and the avoidance of subsequent counter-intention), which is unfortunately something which cannot be articulated, since it is "pre-conceptual" and baked into the nature of experience itself. So, methods could be looked at as already-intensified connective structures, abstract patterns which can be leveraged be associating them with situations and outcomes, which are also structures. Things like the Two Glasses exercises are, then, a sort of cheat, because they leverage pre-existing meaning, and offer the possibility of getting results (at least sufficient to demonstrate there is "something going on") without having to fully "get" the intentional aspect. The focus on methods ends up with a focus on "doing", whereas to dig deeper is to recognise that doing is itself a result, and assigned meaning and assertion of fact is where to focus.

One has to go "meta" on the whole thing of experience, then. It's perhaps a bit like having used your body to manipulate the world for years, pondering the best way to use your body, and then realising "wait, how have I been manipulating my body?" The specific body movements weren't the key thing to wonder about, it was the very fact of the movements. And this is why the subject is best presented as an investigation, experimentation and contemplation into "the nature of experiencing", "the nature of descriptions", "you", "the world", and the relationship between these.

...then there must be such a way to amplify effectiveness.

To turn up the relative intensity of one pattern - or network of facts - versus another, if you will. Exactly. But there is no specific and particular "method" for this, there is only intending, and thereby the intensification of one pattern's contribution to ongoing experience with the reduction of contrary patterns.

I'm tired of long-winded theory that doesn't translate into stuff that actually works.

Yeah, that's where the focus on "the nature of descriptions" comes in. In my view, theories should be looked upon as "patterns to be used" rather than "explanations for how things are". And any long-windedness should involve collaborative deconstruction, targeting assumptions, rather than indulgent imagery (unless that imagery is specifically for creative use; see later). Theories are, after all, simply experiences themselves (the experience of "thinking about theories"), at the same level; they don't get "behind" experience. Theories in this context are "as if" patterns which might be adopted for use; there is no actual "how things are" or "how things work" beyond that. The only fundamental fact is the fact of experiencing - of the property of being-aware or "awareness". Everything else is relatively true only. And so the search for "the" theory or "the" method is immediately a lost cause. "Understanding" something, then, doesn't necessarily lead to any results. If one adopts the pattern of a model (via intention or implication) then once might have experiences "as if" it were true, but the model itself isn't pointing to anything fundamental. Hence the concept of "active metaphors" referenced in the side bar.

.

Anyway, the larger point, with which you'll probably agree, is we need to be very clear when it comes to 'theories' and 'methods' generally, and more specifically we need to focus on what theories and methods are, in relation to experience. I think it's that spirit of investigation, in the absence of a full commitment to direct intention, that is ultimately beneficial - which is why I regularly return to the idea of this being an exploration, rather than a sort of "technology" with a particular underlying structured 'material' (or 'spiritual') mechanism. Otherwise people are at risk of taking a "cargo cult" approach to the subject (that is, emulating the visible actions only, while never grasping the "motive"). The "demo" exercises, then, are just a starting point, giving you a sense that here is something to this, and a possible avenue of investigation: the Two Glasses and the Owls of Eternity exercises are based on the two basic types of structure one might use. There will never be "the" method, because methods are themselves expressions of the insights gained about "you" and "the world" during that investigation.

(With apologies for NYE mobile typing:)

Simply being told to "intend" or to understand myself in one or another variant as experientially transparent (and so on) isn't helping.

Quite so. In terms of discussion, with the causal aspect, it's like trying to explain someone (or to yourself) how you lift your arm (when you are deliberately redirecting away from the current path of movement, not just spontaneous steps along the way to another outcome). Or think about a red car. It's just there. You just... become the experience of it. And in experimenting, it's quite possible that you just end up generating lots of other experiences (like synchronicities) rather than the target experience. This is a better starting point for a conversation, perhaps: That is, with the "form" of an intention - the "idea" we seek to make more prominent in experience - we can make some headway. Key to this, I'd say, is the recognition that all intention is "direct". In other words, you are not "over here" intending something "over there". Treating it in that way, tends to work against us. Rather, you are pulling up a pattern by the bootstraps, everywhere. In a sense, you seek to literally "overwrite" the current experience with a differently-patterned one. Condense "this fact" from the background, in preference to "that fact".

At times I veer towards the belief that a profound deranger is the only thing powerful enough to shift some habitualized center of gravity in the deep mind

Well, in a sense, that is right. If everything, the whole current deterministic state or landscape, is "dissolved" into the background of this moment, available for update - and if the only causal power is "reshaping the landscape" via intention in exactly the same way as deciding to life your arm operates, then we might ask: what is it that is being missed, if there is no actual mechanism behind things (no "behind" at all), that means I struggle to shift facts?

The property of "directness" is one possible important aspect overlooked, I'd say. If you don't do, but only become, then all that matters is that one fully enters into a state. You can't "try" to do this, or you enter the state of "trying to enter a state". You can't be "over here" attempting to enter a state "over there", because that means you inherently remain separate from it, not entering or becoming. Ultimately, you are "taking on the shape of" a state or experience, and that must be done with "full intensity" (except when we're just talking about "plausible but unlikely", non-rule-breaking, occurrences, perhaps leveraging pre-existing patterns, such as Two Glasses brings about). Let's say that one of the "fact-patterns" of one's current state is "inertia" or "solidity". Let's say that the situation right now can be described as: you can move your arms simply by intending "it is true now that my arm moves then" (the "arm movement" pattern) and due to lack of conflict the relative intensity of even a minor holding of that pattern, because that gets it integrated into your state. If we want to do something more dramatic, though - something more like a shift in the facts-of-the-world, it will require "holding" for longer. But far would we go to check if it is possible?

Would we hold for an hour? A day? A week? Perhaps a month? Gradually the obstructing, contrary patterns would dissolve out as the held pattern became primary and conflicting patterns were implicitly removed from contributing. Or perhaps we might, instead of focusing on our outcome, we might focus on the "meta" patterns surrounding it. That is, for as long as the patterning of "the world is an extended place unfolding in time", that would tend to structure your ongoing experience against dreamlike, associative type apparent events. This would be the "weaker the rules" approach, you might say. The ultimate version of this might be patterning oneself with something like the "imagination room" metaphor listed in the sidebar, or the variations described in the "owls of eternity" exercise. So, that was a bit meandering, but the general notion is: We can't talk about the ultimate cause, because it's basically like "shape-shifting", however we might be able to talk about useful patterns (e.g. "active metaphors") to play with, since undoubtedly this (apparently) being-a-person-in-a-world experience consists of a certain set of patterns already - a common starting point for shared investigation. (Putting aside for the moment the issues we hit regarding "shared" worlds.)

...death, trauma, kidnap, the world's most powerful psychedelics, etc.

The apparent power of these, I suggest, in terms of their ability to crack open experience, lies in the fact that there is no particular logical next-step that follows from them?

The lifting your arm example is interesting, because while the core of it is mysterious, nature still has a whole bunch of specific patterns for achieving it

What is this "nature" of which you speak? For certain, lifting your arm is a pattern of experience - a patterning of experience, which one summons or becomes, by essentially recalling the "idea" of it, an idea which is incorporated into the overall sensory experience when one does so. (Whether it is brought fully into the senses or not, though, the idea still exists, and is experienced.)

It is not actually mysterious as such. You know perfectly well how your arm moves. The apparent mystery is when one confuses "knowing" with "creating a set of conceptual objects and forming a coherent description out of them". But that doesn't "explain" arm movement: it simply produces a parallel experience in thought (the experience of "thinking about some concepts I've called 'how arm movement works'").

This is why I implied...perhaps it is more like a "knack" sort of like juggling or riding a bicycle.

I guess you're trying to articulate the idea that one can't conceptualise and communicate, as objects and words, certain experiences, but that doesn't necessarily matter from a personal perspective - one knows these things directly, because one is the doing. You don't need to have a description of seeing in order to see, for example. You just are the experience of seeing. Similarly, arm movement just is, and it is known by recalling the idea, as a sensory experience or a thought experience (these differ only in spatial location in experience, though). There is nothing behind it. And the same applies to the description, too. Adding more experiences at the same level doesn't get "behind" any experience - there is no "behind". Now, at this point you may say something like...

My overall concern is with practical outcome While the theory is interesting...

However, we need to specify what is meant by "theory" here. The above isn't "theory", for example. Rather, it's an attempt to capture in words the direct observation of experience, as it is experienced. Unlike talking about, say, "nature" as a thing behind the scenes whose mechanism is responsible for bringing about our experience, our talk here of "patterns" is simply to draw attention to the properties of structured experience itself and to emphasise there is no "behind". The distinction we're drawing here is between thinking-about experience, and recognising thinking-about as another experience, with the same properties, which never "explains" anything - but can still be used to construct patterns which can later be used as intentional contexts. That is, used "practically". Ultimately, the distinction between "theory" and "practical" falls away, as does the distinction between "literal" and "metaphorical", because they both turn out to be exactly the same thing. By way of this, of course, we find a link between the idea of "pathways" and "outcomes":

A pathway to lifting that spoon "directly with my mind" as we would say (i.e. without using an arm or a tool) does not seem to have any established pathway and is in a sense "rogue."

They are identical in nature. But if we don't spend time actually attending to experience, to establish that fully for ourselves, then none of that matters much perhaps. What sense is there in talking about "practical" is we don't know what "practical" is, or what an "outcome" really is?

(Intermission, from previous discussion:)

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

Now, to tie the two strands together - the dissolving of the theory and the practical, and the description and the "knack" - we need to get a handle on what you might call "intentional context". Ultimately, this is simple: that if you attend to your direct experience, for sure there's the "object" bit, the localised stuff you can draw on paper or think about systematically, but also there's the "knowing" or "meaning" which is sort of non-located, "dissolved" everywhere, inseparable from it. The relevance to "outcomes" is that without the contextual aspect asserted, object-based activities are (literally) meaningless.

(Further intermission, from extended discussion elsewhere:)

Intentional Context Exercise

So, first imagine a sphere in front of you - say, a blue sphere with no particular detail, just floating there. Okay, now imagine a sphere in front of you, identical in every way to the first, except also imagine that this sphere is imbued with the special power to make the room filled with joy. But do not change the sensory aspect of the sphere in any way when you do this. This is basically "imagining the fact of something being true" abstractly. That is, that an object, or your ongoing experience more generally, has a property, without actually visualising any sensory aspects to that property. Instead of doing all the "sensory theatre" of picturing stuff, in an effort to associatively trigger the fact or as an excuse to do so, you can just directly do intending-asserting of the fact into greater prominence. Finally, after taking a pause to clear yourself out a little, instead of using the sphere image, simply directly intend that the room is filled with joy, and experience the result of that. That is, wordlessly intend the fact of: "it is true now that this room is filled with joy". And, um, enjoy.

The suggestion here is that since experience is direct - you are your experience, you are "that which takes on the shape of" experiences and there is no "outside" to you - then with any method you do, you are actually playing out the entire thing as a sort of "sensory theatre". And that's all outcomes actually are: desired moments of sensory theatre, with meaning. In effect, the only way to have something become fact, is to fully imagine-that (to "take on the shape of" the pattern or experience of) it being a fact. Imagining that you are "over here" trying to change something "over there" is like a little play; the entire experience is imaginative.

But it feels subjectively similar to trying to pick up a metal bar with an ultra ultra weak magnet?

Directly imagine being a strong magnet, then! :-)

. . . .

In short, then: "theory" is a type of "outcome", and talk of being practical is meaningless unless it is clearly seen that the "literal" and "metaphorical (that is, sensory experience and descriptions of sensory experience) are the same. However, one pseudo-practical route is to attend to one's direct experience as it is, in addition to experimenting with direct or indirect intentional strategies.

Aside - In terms of the "directness" of experience, the exercises in chapter four of The Michael Chekhov Handbook: For The Actor by Lenard Petit are worth a look, as far as it goes within its subject. You'll have to read between the lines a little when it comes to the "second body" idea (think: what is the first body, what is the whole experience) but the notion of directness, and the very specific sense in which "belief" is relevant, is in itself worthwhile.

(Quickly, for now:)

You do seem to have a fondness for these abstractions, TriumphantGeorge. I

Well, no, not at all really. What do you mean by an "abstraction" and what do you mean by "lingering in practicality" (one might ask)? Without clearly defining those things, we end up with not even abstraction - merely obfuscation (albeit not deliberate). And, you really cannot get more practical and direct than the two exercises I included in the last comment. Did you do them?

One has to actually perform them: in my experience, people tend to think-about such things rather than actually engage with them on their own terms (or at all), just as people rarely actually commit to any line of intentional focus in order to experiment. They tend to want a sort of conceptual coherence or pre-guarantee in thought, but of course that's rather part of the issue. Again: there is no method or "way it works", so the "abstractions" I might suggest are actually patterns to adopt, rather than concepts to think-about. The point is that if one want to have things, "solutions" or "outcomes", defined in the terms of one's current everyday assumptions, then one is already lost. Because those assumptions, that patterning, is exactly the problem we face. That is, if by "practical" what we mean it that we want something to "do" - like a sort of physical

action that will make things happen, that still builds upon the notion of ourselves as some sort of "person object" that is in a "world" that is a "stable, simply-shared, spatially-extended place unfolding in time" - you'll eventually hit a barrier and realise that such actions are already "too late". Such actions are yet more "experiences" and have no causal power, and instead adopting abstractions as fact might be, in a sense, the way forward.

I'm guessing, I suppose, that you prefer talking about those than lingering in practicality.

One might note that "prefer talking" equates to "prefer typing" when it comes to online conversation. On evidence, it could seem to me that you "prefer typing"? Of course, it's not really a preference - it's what conversation is. Nobody can do another's exercises or insights for them. So this is all we have, here. Talking. Discussion. About insights, but not in themselves insights. "Pointing at the moon." It's like saying that a diarist "prefers writing" rather than living, simply because the record of his life, for others, exists only in text?

Some people do prefer reading, though. (Which is fine, of course.) But then, you didn't really engage with any of the content of my reply, at all?

there is an insufficient communication channel established between my waking or "surface" self and some much deeper substratum of my being

This is the ultimate in "theory" or abstraction. Have you ever encountered a "deeper substratum" of your being? Or indeed a "waking" self as distinct from some other self? Directly, I mean. Besides, that is, simply thinking-about such a thing. For me, this subject really comes down to one single insight, and realising the rest (all the rest) is, yes, in a sense talk. But that applies globally, perhaps, to everything that can be discussed at all. AI conversation stops, if we truly commit to that as purity.

(More later:)

Can pick this up tomorrow and address your points more clearly if you like. Really, the most fruitful avenue of discussion is probably on the relationship (if that is even the right concept) between "doing" and "experiencing". Noting along the way, of course, that the very fact of encoding stuff into "conversation" immediately removes us from what we're trying to discuss!

(More responses and musings, with apologies for length:)

Knacks & Doings

Again, it's my experience that some people have a "knack" for these things...meaning that a process is going on that is not identical across different "meditators" who follow identical instructions.

Hmm. Well, quite specifically these are not meditations or processes, but it's certainly true that there is a "knack" in the sense of trying to notice something that you haven't yet noticed or thought about. It is just "there", but it is in the manner of, say, noticing "redness" as distinct but also inherent to a red object. It's like a fact that is there, but you are "looking through it". I'm wary of using the word "knack" because it often implies a skill, in inherent talent. But there is no talent to this; it is always there, and is always a fact (actually the only fundamental fact). A further problem, of course, is that putting it into words (as with all putting-into-words), is unhelpful without the experience to accompany it, since the words are pointing to an experience, and absent the experience the descriptions seem abstract and meaningless (which they are, previously). This loops back to our comments on theory and "talk", earlier.

In other words, missing variables...as I implied earlier.

I'd disagree with that, or at least I'd say it's potentially a misleading idea, since it implies there is some sort of hidden structure to uncover, some secret set of facts or a mechanism. Instead, here, we are talking about the context to all such facts - the context or all content.

The verb in that suggests that people are actually doing something, are achieving that something, or at the very least that it is achievable in principle.

The sense in which one isn't "doing" something is in particular way. I don't mean that one isn't or cannot change one's experience. The point is that if one "jumps", then one is not truly translating one's body into literally pre-existing realities which are divided into "dimensions". It is not "the dimensions what did it". However, one can have an experience "as if" that is happening, just as right now one is having an experience "as if" one is a person in a world (one has "taken on the shape of" apparently being-a-person-in-a-world). And that is enough. That wasn't very clear, probably. What I'm trying to highlight is that all there is, is "experiencing", and regardless of the content of "an experience", there is nothing permanent behind it, other than the fact of "experiencing". (See: the Feeling Out Exercise earlier.)

Ultimately, then, we are noticing that experience is like a shape or pattern in liquid, which - even if it is of "a solid world" or of "jumping dimensions" - has no underlying supporting structure. It's cliché to say it, but "the water" (which is oneself, non-personal) is the only permanent fact, and the "ripple patterns" are just relative disturbances. Furthermore, any descriptions one comes up with about those patterns are just themselves patterns, more experiences. There is no depth to them; they are in parallel. Again, this sounds obscure or even wilfully opaque, but it's much clear if you take a moment to notice your experience, as per that exercise for instance. Without that, one is simply building "castles in the sky": descriptions which might be coherent and self-consistent, but have no foundation, being as they are merely unmoored thoughts within the things they would try to be about. This is why we might tend to resort to metaphors which try to be "meta" and about experience itself, rather than any content (for example: the beach, the blanket, patterned states, and so on). But let's get on to a perhaps more fruitful line of thought:

Dreams, Intentions & Meta

[Deeper substratum] Well...I would say that we encounter such a substratum every night when we dream.

Would you say that dreams are "deeper"? I think the actual experience of dreams doesn't involve any hierarchy or levels. The content is different certainly, but the experience is not different in its nature.

I think some kind of discussion of will is missing here. Intention is just a fancy word for will at the end of the day.

Actually, the word "intention" gets used over the word "will" deliberately, since the latter tends to imply one entity exerting influence over another. Meanwhile, "intention" is nearer to the desired meaning, that of a static idea or pattern which one would like to bring into play. There is no good word for this, though, because we are talking about something which is "before" objects and events. The way I tend to use the term, is this: "intending" is the increasing of the relative contribution of a particular pattern to one's ongoing experience; "an intention" is the pattern (fact or outcome or 'idea' or something more abstract) that one is increasing the relative contribution of. The is a little circular, but that is the nature of it: there is not "you" who is "doing" intending onto a "world"; instead it is a shaping of oneself as the experiencer, or "awareness", or "that which takes on the shape of states and experiences". The possible rejection of the term "will" comes from this requirement to avoid a sense of division and of objects operating on one another.

I just don't think that we know all the variables acting. But this should be seen as the beginning of an exploration and not the end of one.

I don't know about "variables", but it's true that exploration is ongoing, in the sense the one uncovers and perhaps amends the patterning of one's experience. However, the main insight as regards the context is one and done: there is nothing more to be done with that. Really, this is that experience is "imagined" and to change it one must "imagine-that" it is different, directly. Not everyone is interested in that, in what seems to be philosophical musings, though. However, without that, there are difficulties, I'd say, because there's a tendency to want to acquire a particular outcome while still defining it in terms of (implying within the intention) a "format" of the world as a "stable, simply-shared, spatially-extended place unfolding in time". Rather than something more flexible, such as "a sequence of sensory moments recalled from a memory" or "an imagination space within which patterns are drawn", or whatever. This "meta" intending is where one really gets exploring: intending the structuring of experiential content, rather than just intending outcomes. But, again, I really think there's not much point to that if we are content-focused only. This is because then we're still looking for a "how it works, really" by attending to our experiences - and there's a big problem with that, since we tend to have experience which are implied by our own looking.

The results can be useful, of course. After all, if one has a dream of discovering a useful machine, and the machine works in the dream "as if" it can cause desired changes, then even though the machine doesn't really have any causal power (the experience of "the machine" and of "the machine working" are both just patterns; the state of the dreamer), it can still be utilised. The problem only arises if the machine is confused as being "how dreams work", when actually it is the fact of the dream itself - of "experience" more generally - that is the "how things work". Dreams are good to ponder though, I think!

- What are dreams made from?
- What is it that experiences a dream?
- If one has a lucid dream and makes changes, what exactly is making the changes and what is it really changing?

And so on.

. . . .

This has probably drifted a little, I suppose. That's inevitable, though, when we're probably talking at slightly cross purposes, and part of our conversation is really about feeling out what we mean by various terms, and what our differing underlying assumptions might be. And we likely differ on the idea of the "nature of experience" more generally, I guess.

Now, I don't think anyone necessarily needs to think things through so deeply, though, but instead of that they need a certain bloody-mindedness and blind faith in order to commit and/or to persist without holding back. As in lucid dreams or visualising, it's not so much the doing as the full commitment to the outcome, without reservation?

...

[COMMENT]

/u/Redscale7: I've fully been where green-sleeves is, but I completely understand what Triumphant George is saying. I think I can be a good translator. What George is trying to say (and you can correct me George, but keep in mind most of us still speak English here :P) is that yes, you can certainly affect physical/sensory outcomes, and there is no theory or method behind it beyond "you get what you intend as true". The only thing that gets in the way is any patterning you throw on top of that fact (which is the only fact possible, because it's something that doesn't change). The problem (what you may be "missing") is that you are clinging to an extended systemic pattern that says "I am a separate individual trying to change a big complex world" and "I need tools to fix things" and, probably most importantly "the metaphysical act isn't actually real". George isn't saying that you have to be satisfied with just imagining something. It's that you have to take yourself to a point where you accept the metaphysical fact as being equal to a physical fact. Otherwise, you haven't fully committed your faith to your metaphysical acts, no matter what methods you used or how long you tried. You're putting more strength in your physical facts, so they are automatically dominating your attempts to use "tools" to "overcome" them. Additionally, you can only ever encounter experiences that confirm what you already "know". Currently you see other people accomplishing things that you cannot. This is in itself an outcome of experience based upon something you believe. There is no one "out there" in the world. There is no "world". There is only you, and the evidence you have created for yourself to sustain anything you currently believe. This is probably the most mind-bending thing to digest because it means you can't trust your physical world for absolutely anything. There are no true conclusions there, no methods, no supporting evidence of any kind to access. You won't find answers "out there", because out there doesn't exist. Only you exist, and so the only place to look for your "answers" is within yourself. Your world will reflect any conclusions you create and support anything you intend to see. George's "feeling out" exercise is pretty good to apply here. In that quiet space where there is only you as formless background awareness -- where then do all these rules and facts about your world come from? That is patterning. You can let go of that patterning in two ways:

1. Returning to "who you are" by accepting yourself as unpatterned background awareness. Everything else on top of that becomes superficial and therefor easier to drop or manipulate.
2. Actively training yourself into a set of new patterns through repetition, using any method of your choice, while under the firm knowledge that the method itself is not important.

Or you could simultaneously try both. The key is to remember that there are no rules and if you find yourself frustrated with a lack of physical outcomes, it's an indicator for showing you that you haven't yet accepted your metaphysical acts as powerful enough to affect physical facts. You're still too invested in the pre-existing patterns. Digging to find errors and new methods to fix them will only produce more errors and new methods of fixing them, but never the solution (because you'll only ever find what you're looking for), and meanwhile only reinforce your state of being stuck.

I hope this helps. :)

[END OF COMMENT]

It's that you have to take yourself to a point where you accept the metaphysical fact as being equal to a physical fact.

That'll do! Or, perhaps, just stop worrying about that completely, is another option, accepting things at face value (so that your worldview amounts to something like "I am an experiencer within which a series of sensory moments appears" and formulate intentions in terms of that, thus avoiding re-implying other patterns).

...

/u/Redscale7 essentially gives you my clarification below for most of that. Basically, we're talking about taking "one step back" from the discussion we're having right now. Even talking about "the subconscious" realm is already using or implying a pattern which is "too late" for what we're dealing with here. We're talking about patterning itself. To pick up on one point, though:

The sense in which there is no method, is that there is no particular method, in terms of an act one might take. This isn't to say there aren't currently present patterns that you might leverage, though. For example, we might say that the Two Glasses leverages the patterns of "translation and transformation" and "volumes and intensity", and moving your arm leverages a whole "body" postural pattern, and there are lots of more abstract patterns that we use, and so on. The pattern of "I am an object located in a world which like a 'place' which unfolds in time" is a more basic one, still. However, those patterns aren't fundamental. This includes the "world" one. And patterns don't cause anything, rather they are the current state of experience. The only cause of change is intention, which is to say, selecting a pattern into experience. As you note, in your wording, doesn't it seem that there "forces" operating against us?

The way forward, then, for major change isn't to leverage existing patterns (that is, intending the pattern "it is true now that my arm moves then" and the rest being just the existing postural pattern as the "auto-completed" extension of that), it is to amend patterns as well. But the "method" remains simply intention. It's just that the target (or better to say: the pattern being intended, intensified) is different, is more general.

To further clarify: For the sake of argument, we might say that all possible patterns exist eternally, are always "true" to some extent, we might say that patterns vary only in their relative intensity, or strength of contribution to experience. We might also say that at any moment, the world must "make sense" - that is, be an overall coherent pattern. If this is so, and we have a very strong pattern of "I am an object in a solid spatial, temporal world", then, like the arm-movement intention which is done in the context of the body posture, our intentions are structured by the context of that pattern. A synchronicity might arise here and there through the gaps and feel a bit dreamlike, but not much more than that. A reason to persist in that, though, is that the more one has synchronicity and recognises the meaning of that, the more one's intentions with will tend to intensify the pattern of "the world is dreamlike" as a byproduct, an implication. However, from what we're saying above, we could just go for intending the pattern "the world is dreamlike" directly. This is like changing our "posture" such that the manner of our "arm movement" changes, becomes more flexible. (And this is actually a way to change your bodily posture and movement - of course, because it's all the same thing, all just patterns of experience. That's why, for exploratory exercises, I quite recommend that Michael Chekhov book by Lenard Petit, and also the Alexander Technique book by Missy Vineyard.)

Putting it together: So we could summarise that with something like the following, jumping ahead a bit admittedly:

- The only fundamental fact is the fact of being-aware or "awareness".
- All other facts are temporary and relative, as patterns in awareness.
- All possible patterns exist, eternally, and are available right now. (You can conceive of them as being "dissolved into the background" of this ongoing moment, now.)
- What you actually are, is "awareness" which has "taken on the shape of" a set of patterns = a "state".
- A "state" fully defines our experience, completely. That is, it defines all moments over all time, deterministically, between shifts.
- To shift one's state, one simply "intends" a pattern, and that pattern then becomes more prominent in the state, and so in our ongoing sensory experience. This is like a "shape-shifting", a movement of oneself as "awareness". There is no way to describe this or explain it; it is a "becoming" rather than a "doing".

- One can conceive of the experience of apparently being-a-person-in-a-world as a single pattern, a "world-pattern", which is always self-consistent (between updates, that is).
- If your world-pattern has a strong component of "I am an object in a solid stable world" then any additional minor patterns you intend such as "I will get healthy again" will be incorporated within that context (and, in some cases, will just arise as dreams plus a couple of synchronicities, rather than main outcomes).
- To improve the quality of outcomes, one should consider intending the context directly, such as "the world is dreamlike, fluid, and symbolic".

Roughly, then: no facts are fundamental, intention is the only cause or method, conceiving of the world as a pattern of patterns is one of the most flexible positions to adopt - and the world is a "shape" that you take on, directly.

One further implication of the "directness" of all this, is that:

- It is very important to fully decide and declare that it is a fact that your outcome is going to happen ("it is true now that this happens then"), either directly or by implying it in some way. [1]

Essentially, one must actually decide what is going to happen, and that it is going to happen, because it is this deciding or asserting which makes (is!) the change. Without that, any apparent method becomes simply an activity - in effect, an intention only to have the experience of performing a ritual, a bit of "sensory theatre". It's rather like the difference between intending to" tense your arm muscles against an object in order to move it", versus "intending to move the object into a new position". They are quite distinct things. (A good exercise for this, is to challenge a friend to an arm wrestle. First, proceed by intending to "use your muscles to move your arm". Then, instead proceed by "intending that it is true that you win the arm wrestle". Note the difference.)

[1] It occurs to me to add, for clarity, that of course when we say things like "intend that 'it is true now that this happens then'", we don't mean that we should verbalise or think the words. Rather, we're referring to attending to the pattern that this statement would describe. Whilst saying words, or visualising images, does bring to mind that pattern just by association (which is the experience of having the "meaning" of the words or image), when we intend we just go for it directly - otherwise we are often just intensifying the experience of saying or thinking the words, rather than intensifying what the words mean or the fact-pattern they point to. There is no particular sensory experience associated with intending, we just "know" that we are doing so. The except to that is, of course, if the intention is something that would have an impact on our current moment, because then we will experience the result - for example, if we intend that "it is true now that my body is becoming completely relaxed", or in the case of the blue sphere exercise, that "the blue sphere means-that it is true now that I am feeling joyful". (Plainly, this is all much more complex in the description than in the doing: hence experimenting with the Feeling Out and Intentional Context exercises, say, is better than a discussion about it, since they are it.)

(This got quite long, perhaps we should pick one single point of contention and expand on it, but remembering that descriptions don't really matter much, because this isn't something for which one generates 'explanations'. It may be that "intention", for example, might be better termed "direct imagination", for you, and that it is better starting with exploring exactly how that relates to body movements, rather than jumping straight to discussion about "facts of the world" and so on. Meanwhile: have you ever actually taken the time to "intend that the Earth has two moons"? Closed your eyes, just intended the fact of that for just ten minutes? Worth doing, I'd say.)

"Nature" & Patterning

I think that nature has a “patterning”...a fullness as well as an emptiness

We return here to "what is nature?", though (it is a concept) and from there we see that the "fullness-emptiness" issue is an aspect of our description, not of things-as-they-are?

Is a better way to say this, perhaps, that "my ongoing experience has a level patterning of which seems stable and unchanging, a formatting which seems more resistant to change"?

Prominence, Descriptions, Hidden Variables

But what about when it is doesn’t become prominent?

It's a metaphor. There isn't really an "it" that is there when it isn't prominent. "Patterning" is just (I suggest) the most basic sort of description we can have of structured experience. But it is just a description. The description itself is just another experience you can have (the experience of "thinking about experience"). We can have experiences "as if" that experience is true, but you can't actually describe what is true at all - because it is just: the very fact of "experiencing". That's why I say it's not an explanation of experience, because it is inherently not possible to have an explanation of experience (since "experience" is that from which all explanations are "made", in a manner of speaking). It's also why I say we have to just put thinking aside (since thinking is object-based), and notice our experience as it is, directly - and realise that what we are is the subject to all experience.

When doing this, we also notice something important: that concepts of something outside of the current experience are themselves mental objects within experience. The idea of "all patterns dissolved in the background" is a matter of convenience, a bookmark. The direct experience is that "we never experience what we don't experience", and so it is meaningless to talk of non-prominence. Because even if you are just thinking about an object, that is also a prominent pattern, just not within the main strand of experience (the 1st-person "me in a world" strand). Both the thinking-about and the main strand are arising within and of you-as-awareness. They differ in location, not in kind. The thought of non-prominence is itself a prominence!

Your "hidden variables" are a bookmark of this type also. But any experience you have of "hidden variables" will just be another experience - and they will not be causal, therefore. They will be content, they will be a "result".

EDIT: It later occurred to me you might mean something of the form "where is a fact when I am not directly experiencing it?". But I would say, in this description, that you always are directly experiencing it, as a background that is always there, just not unfolded as a sensory aspect. In a similar way as you can "know" your current situation, even though you haven't unpacked the "knowing" into words, and pictures, and so on. The parts of the world you aren't experiencing in the senses, and the "infinite eternal gloop of all patterns" of the background, are both always there, and you are always experiencing them, as you-as-awareness having adopted a state which consists of you-as-awareness (empty!) as all possible patterns (full!) at relative contribution (empty and full!).

Simplicity & Problems

It’s just not that simple. If it were, everybody would be doing this successfully all the time.

That's good point, of course. But the way in which it is not simple (going with our little model for the moment) isn't in the causation, it's in the patterns or ideas we choose to intensify.

A few of thoughts:

First: Because everything is direct (because there is only you-as-awareness and no outside to that) then the full context of the intention matters. As we were discussing previously, just verbalising or visualising isn't sufficient, it is the assigned meaning of that which also matters. More accurately, the pattern you intend has to actually be the fact you wish to intensify. It can't be a pattern about the fact, it must be directly that target fact, or a fact which in turn implies the target fact.

Second, and related to the first: There is not "you-over-here" intending "pattern-over-there". Intending or implying any pattern which consist of a division of this sort, is problematic. This is really a restatement of the notion that you must actually intend the outcome you want as the outcome, and not a relationship with the outcome.

Finally, all intentions have a context, a sort of structure they are formulated in terms of, and they re-imply that context. So, in everyday life, if you intend to change direction walk "over there", then that intention is in terms of a certain idea of the world - as a "place" or whatever, that is solid, and so on. Or you interrupt yourself to intend taking a certain route because it is well-lit and "the world is a dangerous place". This can be an issue.

Aside - We should forget hypnotists and the like and "other" people, I suggest, except as a sort of in-experience narrative. This is best handled as a 1st-person perspective topic. We should be careful, really, about "people" and "everybody", because in a sense neither they nor you, as a "person", are causal agents. Apparently being-a-person-in-a-world is an experience you have, a formatting; it is not what you are. This brings us back to the impossibility of writing a full description, though, because there is not many or one "awarenesses" - there is just "awareness", which is "before" division and objects and change.

Patterns & Practicality

So, "getting practical", we have a couple of ways in which it is "not that simple", for sure. One is that the intention is incorporated into a pre-existing formatting, and we may need to intend modifications to the formatting (intending that the world is more dreamlike and flexible, or adopting a specific model such as the "moments of memory" model). Another is that really the intention, to get the structure and relationship right, should be formulated in terms of you being "the subject to all experience" - a sort of unbounded container within which a strand of sensory experience or thought is unfolding - rather as a person-object located within a world. The final problem is that we want to avoid implying the old situation when we are intending a new one, or after doing so. People try to get around this by going into a very relaxed state, or perhaps intending as they go to sleep, using those as times of "non-obstruction". Ideally, though, one goes beyond that "trance or sleeping" approach and adopts the attitude of "letting things be however they are" always (basically "non-doing"). Then, instead of reacting to the unfolding content of the moment - thereby perhaps counter-intending and therefore re-implying, say, a "solid limited world" concept or whatever - one has adopted a stance of spontaneous flow and "allowing". Then, we are ceasing to interfere except with very occasional, specific intentions as "updates". This means letting bodily movements and mental thoughts unfold by themselves also, of course - not just the surrounding environment - because those are part of the experience of "the world".

For this last bit, when we first do it, there's often a lot of odd "stuck movements and incomplete thoughts" which seems arise, so there's definitely room for some sort of daily releasing exercise where one practices this "letting go" approach. Not because one gets better at it, but because one's posture is likely coiled and held, and there's some crazy spasming (or more) until one lets them play out. Until then, it's quite possible that one is spending a lot of time counter-intending this "open attention" movement, and thereby (since body and world are one pattern) effectively opposing all movement of one's state of experience, by implication. (Such a daily releasing can either be passive, or you can intend being "open" to direct it. There's a link in the introduction post which mentions both.)

Aside - People often do "meditation" in the hope of either realising the nature of experience, or for stabilising or clearing their ongoing experience. My feeling is that, when it comes to the former there are better ways to do it than passive meditation (it's pure luck whether you accidentally have an experience which leads you to notice, a deliberate investigation is much better). Meanwhile, for the latter you need to be quite clear about the target formatting you are after rather than just concentrating on one sensation or idea or whatever - and if you're going to spend the rest of the day in resistance and scatter-gun intending and implying, you'd be better tackling that instead.

Let me emphasize: this is not about contention for me, but about practicality.

Well, the contention would be our differences in how we think things to be, or the way in which we think about them; that is what we are exploring.

Also, I'll simply lift the points from your post that speak to me, so I wouldn't worry about length.

This isn't often the best way to proceed, I'd say, since lifting the points that speak to us often aren't the points where progress is made, it's usually in the areas or assumptions being overlooked - this applies to my understanding of what you are saying, too. So it's often better to take a single strand, and pursue it thoroughly. Notably, there's a couple of points I definitely haven't got across properly in previous comments, based on your "manifestation" and "meaningless of non-prominence" responses, which tie back to what it means to describe an experience (or experience a description). And the points you have engaged with have tended not to be the ones that matter, I'd say - quite possibly due to the bloat of the conversation, and quite possibly because I have not successfully made them seem to matter!

So we need to take a step back, to continue.

To what end, though? I don't particularly want the Earth to have two moons.

To test it! To see what happens with such an "ambitious" intention. Otherwise...

The former is indeed easier to realize, in my opinion, because it can slide between the gaps in much looser-habit patterns that mostly pertain only to the intending individual, and which do not impact others with paradox or a fundamental change in the experienced world applicable everywhere.

...otherwise this is meaningless. As you say, it's just an opinion, based on untested assumptions about "others", the nature of "the world". Even saying "the intending individual" is problematic (because it is not clear at all that "the individual" intends anything). Much of your comments appear to suffer from the same issue. You are stating things based on a description of the world which, I am suggesting, is not (necessarily) the case. More to the point, based on assumptions about ongoing experience which are fairly easily examined - if you were to choose to do so (as per exercises in previous comment, for example). The reason to try to "manifest" things you don't necessarily care about, is exactly to manifest things you don't necessarily care about - to experiment and investigate the properties of experience. Otherwise you're just talking about perceived likelihood, for example, while fulfilling the prophecy through selective action.

And to the best of my (conscious) ability I do indeed try to envision the world as more dream-like and malleable.

Perhaps we could use this as our seed, to clarify what we're actually talking about here, and from what position. (Assuming you want to continue.) So I'd kick off by asking:

- How, exactly, have you gone about doing this? (To the extent one can articulate such a thing, of course.)
- How would you describe what "you" are, what "the world" is, and what the relationship is between those?

And also I'd suggest you try the Feeling Out Exercise and the Intentional Context Exercise and offer your perspective on the experiences. Because without that (or something similar) there is no anchor to our discussion, since my descriptions are pointing to something you've never examined, and so for you they are just a bunch of words addressed to nowhere.

I've tried it with other things that haven't worked, so it is not untested.

The point was to examine more closely the way one attempts to do it, and the way in which it doesn't work. In terms of a conceptual framework, we've already covered a way of understanding why, say, you don't just decide to turn a house into a mouse, and have it happen. Specifically, I went into one way of conceptualising the nature of that apparent "inertia" and how - if - we can address it.

Not really. I'm suggesting things based on empirical accountability.

You are suggesting things based on an interpretation of your experience (which is fine), and I was attempting to discuss the context of experiences more generally - how to examine that directly, and its implications for both understanding our everyday experience and the possibility of "unusual change", and then proceed to how we might tackle particular changes. So far (quite possibly due to my own style of writing of course), we've gained no momentum on the key points, largely because I've failed to engage you in the areas I think we need to explore in order to get a better perspective on the "why can't I just change a house into a mouse" factor. Your replies have tended to be restatements of a certain point omitting what I think were the important parts of my responses that address that point, for example. It's not clear, for instance, that what you mean by "intention" is what I am referring to by that term (it is not a the same as a "wanting" or "asking" or "willing"). And your suggestion that I was referring to, say, altering "perception" rather than "really" creating change means that I've not successfully conveyed what I mean by the directness of experience. I concluded the last comment with a possible path to opening out the conversation, by connecting it to some specific questions and activities. You've not responded to those, but that was a way to ground our discussion so we'd no longer be talking past one another. It may be that our conversational styles just not a good match when it comes to this topic. Or it may be that you've actually decided that "this doesn't work" and this is due to "hidden variables", and aren't interested in exploring an angle other than one based upon that idea. (Perhaps you find particularly unappealing a perspective based on a philosophy that sees these ideas as relatively useful for leveraging, but otherwise basically fundamentally meaningless.) Either is fine, of course, but it does mean we're not going to be getting anywhere with this!

Q1: I think he just wants to know what you personally can do. He wants to clarify if you have been able to experiece dimensional jumping in a way that cant possibly be explained by the solid world model. Its about the person, triumphantgeorge himself. Like are you basing this on personal experience or not, and if so, describe something which yiu experienced that couldn,t have been a a coincidence like willing a continent in existence.

Perhaps. What good would that do, though? I'm just some (apparent) bloke on the internet - strictly speaking, a bunch of words arising within his experience, an aspect of his own patterning! Another story for someone to read! :-)

Slight joking aside, it's very much a personal investigation of oneself, this; it doesn't really matter what other people seem to do. Hence, trying to return to a particular direct experience everyone can have immediately (feeling out; intentional context) so we've got something shared and immediate to talk about, then take it from there (especially since focusing on the "philosophical" aspect wasn't taking). As per the sidebar, the subreddit isn't really about convincing someone about something - more of a: try this, contemplate the implications, now push it further, and discuss. And if someone doesn't get anything out of it, if it seems to them that there is nothing to it then, of course, they should dismiss it and move on. (As a moderator, I try to be sort of agnostic and more of a prompter than anything else.) Although: There are two things to consider in all this: a) noticing the nature of experience as it is; b) investigating our ability to change it. The first, I think, is always accessible. (And in turn hopefully changes one's ideas and approach regarding the latter; but it does require that someone actually looks.)

...

I'm not convinced that you have an answer, and you know what... because I don't think anyone here or elsewhere (including me of course) really does.

I'd agree, in a sense. Where we differ, though, is that I see some questions as not being answerable because the particular questions are prompts for a change of context; those questions are often based on assumptions that we'd want to challenge in order to progress. Nobody can give us a fundamental "how it works" type response, describing a process or mechanism, for example, because the very idea of a process or mechanism is one of the things under examination - the idea of division, one object operating on another, causing something by overlap in location or time, and so on. So we end up with responses that seem to be trying to sidestep the whole thing, because they are trying essentially trying to undercut the assumptions. That, or the responses are of the sort that indicate one simply "does" it - e.g. there is no "method" to producing a mental image, one simply does so, and if one "attempts" to produce one, one produces the experience of "attempting" rather than "picturing", and so on. Better, I think, is to try to draw attention to the properties of direct experience (which I tend to thing provides that new context which changes how we approach things), to work on clarifying the meaning of terms, and the "personal exploration" factor which is involved. For example, Paul Linden's little summary of intention is quite good:

[QUOTE]

We can begin by trying an exercise which focuses on the difference between movement and the will to move (or, to say it another way, the difference between the physical body and its programming for action). Stand up with your eyes shut and imagine that you have come up to an elevator. You have a large package in your arms that you cannot put down so you can't push the elevator button with your finger. Imagine the elevator button floating in the air an inch or two to the side of one shoulder, and imagine that you have to lean over sideways and push the elevator button with your shoulder. Actually intend to push the button. Create a real desire to push the button and intend to do so. This does not mean voluntarily moving to lean over and push the button, nor does it mean becoming stiff to prevent any movement so as to keep the exercise purely “mental”. It also does not mean merely thinking about pushing the button since “thinking about” is a symbolic process which implies a separation between the thinker and the subject about which s/he thinks. In the same way, it does not mean going into a dissociated daze and picturing yourself pushing the button. It simply means to relax, be natural and create an authentic feeling in the mindbody of desire and intention to push the button. (Most people can create this feeling when they focus on it, though many need some guidance to home in on it.) Once you establish this feeling, you will feel yourself “involuntarily” tipping toward the imaginary button.

-- Being in Movement: Intention as Somatic Meditation

[END OF QUOTE]

The later case study is an example of the exploratory process which one goes through for changing movement patterns, but applies equally to the "patterning" of experience more generally, beginning:

Case Study: As I learned how to use this approach to movement on myself, I also began to use it in my teaching and teach it as a way of moving. The final section of this article describes one example of the application of the intentional approach in teaching.

This is similar to the Michael Chekhov acting book mentioned earlier, of course. Now, I get that this might seem to be unhelpful in terms of "answers", but if the answers are non-conceptual, perhaps, or otherwise cannot be communicated, or if they involve a reframing rather than an extension of our current ideas, then "communication by shared events" (exercises) is one way forward. So that's where I'm coming from, and if other people who've tried that are "I used to be where you are", they just mean they've explored that side of things and are thinking differently about things as a result - but, of course, not necessarily correctly, eh? Only you can decide!

POST: Death

I imagine you would experience a body dying. And it might be quite painful!

Afterwards, we might hypothesise: experiencing would continue because awareness is permanent (the context), however your personal experience might not and could be discontinuous (the content). In other words, there is no guarantee that the pattern of your personal identity, the felt-memory, would persist. This might depend on whether you are identified with particular aspects of the experience, the body area or the background, and so on. However, if we're using the "patterning" model of experience, then next-moment would have to make logical sense, in some way.

Q1: Near death experiences might be not just clouds and harps [https://www.youtube.com/results?search_query=near+death+experiences+hell], especially after suicide.

What a downer! Maybe it'll just be very void. (There are quite a few interesting reports gathered on that site [www.nderf.org]; it's fascinating how they differ in terms of imagery and narrative, and in what ways they are similar in their more abstract elements.)

Q2: similar in their more abstract elements

I wonder if this means that there is a special home/source dimension... But, speaking of hell, what's your take on pain? From a physicalist standpoint, pain is useful. It's tough love from our genes, teaching us how to survive. Instead, what is the role of pain in the context of the patterning model? Is it just one of the available qualia in the palette, without any real ultimate meaning?

My suggestion: Discomfort is the experience that corresponds to being in a state which is not logically coherent - and pain occurs when we resist the movement that would make it so. Examples might range from the mundane and everyday, to the implications arising from intending larger world facts. For instance, intending a held physical position beyond which the body would natural move out of it, or intending an external event and then resisting the experiential content of the implied moments leading to that event. As for home dimensions - I'm of the view that there is no "special" state. All states/experiences are simply awareness "taking on the shape of" a particular structure. The idea of "specialness" surely comes from a narrative about those structures, and doesn't reside in the states themselves as such? After all, the feeling of something being special, is just an experience. However, it's interesting that the more "open" and "undivided" an experience is, the more blissful it is. So in those terms, complete eternal void is a "special state" - but it's not special as in being an ultimate goal or end-point for our investigations. That is about coming to an understanding of the nature of experience in general, rather than about the content of any particular state. Aside: Actually, this is a good point: many "seekers", I think, confuse these unbounded experiences with "being enlightened" and seek them out. But being "enlightened" is about the conclusion you draw from these experiences; it's not about the experience itself. It probably doesn't help that the term "enlightened" is now completely mangled as regards its meaning; I usually avoid it as a result.

Is logical consistency an ordinary adjustable pattern like others or an ironclad meta-law ruling them all?

I'd say that logical consistency is simply inherent in patterning, since although any pattern is applied as an adjustment everywhere like an overlay, there is only one single pattern. I sometimes use the example of moire fringes to illustrate this: adding one pattern on top of another simply does result in the final pattern; the result isn't "calculated" or "generated" by anything. Note, though, that by "logic" I don't mean "corresponds to your narrative about experience". I mean more that the pattern is

internally self-consistent. This has to be the case really, because a landscape can't conflict with itself, there can't be some parts which are 3D and some parts 2D, unless they are being held in some way.

Night dreams

So, night dreams are "logical" in the sense that the experience is fully consistent with the patterning of the dream - because the experience is the patterning of the dream. The less deeply patterned, though, the more your experience tends towards being as series of associated images with a sense of there being a "world" behind them. Like, a circle turns into a sphere turns into a planet turns into a beach-ball. That is internally consistent (the beachball isn't simultaneously a square) but it does not correspond to the narrative of our everyday worlds. It is logically coherent within its own domain.

Any sufficiently constrained idealism is indistinguishable from materialism...

Very well said!

It's understandable. Who likes to chop wood and carry water???

Well, after enlightenment, everyone likes to chop wood and carry water! One of the great concerns of our age, surely, is that maybe suddenly everyone will become enlightened, and we'll run out of forests and streams to service this new enthusiasm. ;-)

But that seems an intrinsic and fully deterministic process

So I guess the question here is really: "how does it ever occur to us to intend something outside of our experience?"

Pondering this: we aren't in the world-pattern, the world-pattern is within us - or more accurately, we have "taken on the shape of" the current state of the pattern (perhaps unwittingly). However, the pattern doesn't limit the possibilities for your intention at all, except in a round about way, which is:

Descriptions & Intentions

Descriptions tend to inform - that is, become the form of - your intentions, and so those intentions imply the larger descriptive framework of which they are a part. Descriptions are not how things are, but the intentions based on them create patterns of experience "as if" they were. Thus, we tend to encounter evidence which supports our explanations, which we then use as the basis of our intentions, which further entrenches those patterns by implying them, and so on.

It's only deterministic between shifts, and those shifts are dictated by intention and its logical implications within the pattern, which includes implications about there being a change in the base formatting of the pattern. Since that "how" does matter, only the "what" or the outcome, and that outcome can be partially defined (in fact it always is really), this opens up the possibility that simply wishing for something different is sufficient to create a different experience outside of the circle of observations to date. Now, this is difficult to put into words, but in truth we are always experiencing all possible patterns or facts all the time - it's just that some facts are "brighter" than others (selected relatively by intention or attention) - and we are always experiencing that are an "open space" in which the sensory experience is floating. This means that the possibility of relaxing into that open perspective is always available, and it's more a case of ceasing to counter that rather than intend for it. This is perhaps why times of pain and desperation are often the moments where one realises the fundamental nature of experiencing (and the non-fundamental nature of content). Although sometimes people get hung up on the experience rather than the implication, it must be said.

Q2: *It's only deterministic between shifts, and those shifts are dictated by intention and its logical implications within the pattern, which includes implications about there being a change in the base formatting of the pattern.*
Not sure how to unravel some intricate parts of your post without a couple of NZT pills, but I can take it as a valuable mental workout. Shifts are dictated by intention. Intentions are dictated by what? It seems to me that the infinite rube goldberg causal chain works in a circular way: our intentions create/update experiences... effects are not fully predictable... so there are always some unforeseen good and bad aspects... and we intend to increase good things and decrease bad things... our intentions create/update experiences... Even if we choose to surrender, to "relax into the open perspective", it's because we believe that this is the best thing to "do". Determinism, here, seems pervasive and inescapable. What are the alternatives? Partial randomness? Fractal chaos?

The thing is: it's only deterministic between shifts. If I intend something right now, I can't pre-calculate the resulting state or world-pattern in advance, and therefore any desire that might arise from that state, and so on. Furthermore, since there is no "outside" to my state, any thinking we are doing right now about this that involves "looking at it" is implying a view point that never, in fact, exists. This is similar to how my thoughts about experience are also themselves within experience. And if I imagine there being an "outside" to experience, that "outside" is also really just an imagining within it - since awareness has no boundary, and so any apparent inside or outside are actually experiential content of the overall context. So, it makes no sense to talk about free will outside of the state or pattern, and many discussions about determinism and free will are implying exactly that. Essentially: "ah, but you can't decide to do something that cannot be thought of, and you won't decide to do something that you don't want to do". That's pretty meaningless though, right?

(We could make some extra points about how strands of thought can, in effect, be their own shiftable worlds and used as a source of creativity outside of the main strand, being also unpredictable between shifts.)

Q2: *If I intend something right now, I can't pre-calculate the resulting state or world-pattern in advance*
True, we can't know things in advance, but the patterning model is not time-bound...You've said that time is just an ordinary pattern, adjustable and deactivable, overlaid on the others. Doesn't this imply that, behind the tick-tocks, everything is "already" pre-calculated? And I don't mean it in the fixed-timeline-predestination sense (because, of course, there is an infinite number of trajectories on the Grid of All Possible Moments), but in the automata-programming sense -- i.e. for each state, all the possible transitions to other states are fully predetermined by precise if-then rules.
it makes no sense to talk about free will outside of the state or pattern
Neither inside. Free will is nowhere to be found. So, in a deterministic model, subjective experiences like pain or sadness or disgust or fear give a sense of cosmic unfairness. Luckily, evolution appears to be headed in the direction of eternal betterment. At least, this is comforting.

The thing is, though: from what perspective is everything pre-calculated? That perspective you are imagining, never "is". It's another example of the "view from nowhere": looking at a mental diagram within the thing it is meant to be a diagram of. I get what you are going for, though, which can essentially boil down to:

- Given a full set of information, surely we will always intend what we want, so isn't that intention "pre-ordained"?

The first response to this is as above: that the mental map we're referring to in this discussion never exists in actuality. After a shift, the old state simply doesn't exist anymore, there is no memory of it, so to talk of determinism between states doesn't make sense. The second response is that "free will" is the ability to be able to, in principle, choose any option. If it so happens that we always choose the most attractive option, then that is still a free choice. In actual fact, the "making the best choice" idea is just a theory of what will happen - and it is contentless, surely? Because cannot predict the options or our desires prior to encountering them; certainly we can't predict what they will be post-state-shift. And if we cannot actually predict our own choices in advance, then they are not deterministic, and the theory is simply a narrative. I can't help but feel that this sort of thing needs actual illustrations to point at. :-)

Q2: *After a shift, the old state simply doesn't exist anymore, there is no memory of it, so to talk of determinism between states doesn't make sense.*
I'm way off base. I was thinking in terms of eternalism, but that seems more akin to presentism. However, I don't understand how such thing could be dynamic and timeless at the same -uhm- time. Thank you for your help and your patience. I give up on the mind-screwing theoretical stuff for now...
I can't help but feel that this sort of thing needs actual illustrations to point at. :-)
Releasing "Act = Fact, Part 2" in comic strip form would be epic. Even better with some Kung-Fu Owls kicking physicalist asses!

Well, it's "eternal" in the sense that "all possible facts and patterns are present and true always, now", it's "presentism" in the sense that you-as-awareness are in a static state (between shifts), and that state corresponds those facts and patterns being at different levels of "truth" or "intensity of contribution". Even "time passing" is a static pattern within a particular state. But - it's just a description, albeit a description which aims to be the most abstract that makes logical sense, and therefore the most flexible that is consistent with our experience. That is, intentions based on it do not imply additional complications. It's a "clean" model. You don't really need the model, any model,

in order to get along. After all, it's just another "parallel construction in thought" rather than the world-as-it-is. Recognising that the world-as-it-is isn't any particular way, is probably enough (although that takes a bit of faith and the admission of uncertainty). So, the "edited highlight" would be, I suppose: Intending is the only cause, however intentions based on a description also tend to imply the pattern of that description - and hence tend to trigger experiences "as if" that description were true. If you intend something which is formulated based on the assumption that "the world is a spatially-extended place", then your intention also contains that pattern as part of the outcome you are intending. If you intend help from the Norse Gods, for example, then you will be implying their existence by doing so, and will tend to have other experiences "as if" the Norse Gods were around. Heh, I rather like your idea for "Part 2". I do think the Owls of Eternity need a starring role; it's the obvious next step after the success of their very fashionable eyewear range! (8>)=

Q3: it's only deterministic between shifts when i shift my attention to something else than the thing i'm concerned with, then synchronicities happen (which are based on other strands of thought). e.g. what i want or expect won't happen until i become engrossed in something else. this seems silly.

Possible explanation: This is because when you are focused on something, the "boundary" between that strand of thought and the main strand of experience is fairly strong. You keep thinking about it, which implies the pattern of that thought is separate from the rest of experience. When you let of of that and look elsewhere, you are ceasing to hold that image in a constrained bubble, and it becomes a more seamless part of the overall space of experience. The possible solution: to intend into and as the main strand from the outset. For example, rather than focusing on a little bubble of thought and intending there, instead begin by either becoming aware of the background space to your main experience, or focus on an imaginary object floating within the main strand - and use that as your intentional focus. (It doesn't matter if your attention is on a small area of the main experience; intention should apply "globally" anyway even if your attention is "local".)

Q4: I remember you saying that the head gap is the background space. So to put the above into practice to go from seated=>standing, would we begin by placing our attention into the area behind our forehead, and then imagine-that we are already stood up, not interfering?

It actually shouldn't matter where your attention is, because intention applies as a whole, across the entirety. Provided it's directed in the main strand, and is not narrowed-focused on some part of your body and preventing it changing, you should be able to attend anywhere, or completely openly, and your intention will work. You can think of intending as resulting in a sort dissolved pattern across the entire world, but whose sensory aspects are only experienced if a result of that intention overlaps with your current sensory moment. So, when you intend standing up, the pattern - "the intention" plus its implication - is really a static pattern laid out from this-moment running to that-moment, which you subsequently encounter as "time passes" across it. So, I when intend to "stand up" that means: the fact-of-being-stood up is placed a few moments away, which implies a set of moments between that-moment (being stood up) and the current this-moment (being sat down). Then, I start to experience "standing up" happening as I scan across the moments from this-moment to that-moment.

Q4: Ugh, I understand everything perfectly conceptually, but the bottleneck to using this stuff practically really is - how do you insert the fact itself into your future. And of course, the answer is - well, it can't be described in words! Also, from the perspective of being-a-human, it seems to be extremely challenging to insert facts that are not at all plausible. My classic example that I use is to decide that you will receive a text message from a certain person within 5 minutes. I'm consistently unable to do it even with the firmest of deciding!
EDIT: When I say "using this stuff practically", I don't mean misdirection or assignment of meaning exercises, those often work with minimal commitment. I mean having the ability to directly insert facts when you please.

Yeah, since it just is - it's identical to being - it's like trying to describe to someone how to think a thought, or how to hear sounds, or even more mundane: how would you describe to someone how to lift their arm? In all cases, you just "become" the outcome and then you have the experience of it happening. But that's not very easy (i.e. not possible) to describe, so we end up talking about pretty much everything else instead - sigh!

Q4: To me, the implications of this is that the only route to truly figuring it out is through constant testing in your own experience. If descriptions just can't capture intending, surely there is no point to asking your dream characters how to describe it! Even though we do it anyway at some point in our exploration. Although, I have to say that I'm not willing to accept that descriptions are completely meaningless compared to firsthand experience. I think descriptions can be useful to initially point us in the right direction, which is then followed by personal experimentation to solidify understanding. Lastly, I feel that there is a luck component to all of this. It could take you 10 tries or 1,000,000 tries to finally realize how to insert a fact.

I agree that descriptions aren't completely meaningless. I think they are useful in two ways:

- They provide inspiration for intentions. Also, intending based on a description also implies the extended pattern of that description, so your ongoing experience starts behaving "as if" your description is true, even though the description itself is parallel and non-causal.
- They can be useful for pointing out gaps, and thereby encouraging us to direct attention towards those gaps. Although the description, or language more generally, cannot communicate those gaps, the realisation of the "fact of the absence" can lead to us attending to the thing that can't be described.

For example, say you've got a hand-waving notion of how you summon a thought or how you summon an arm movement, but you never examine it. Now, someone points out to you that there is a gap in your description of how your world unfolds. The attempt to describe this gap, and the failure of the attempt, leads you to recognise "intention" and "experiencing", and to investigate what it is you are doing (or not doing), even though is "before" words and cannot be codified. Now, I maybe wouldn't call it luck, exactly, but there is certainly an element of discovery involved. That is, you end up attending to your own patterning and your current state. So for sure, you can't get any better at intending as such - it's not a skill, just like you can't get better at being - but you can certainly get better at constructing intentions through better understanding what it is. Typically, ending up with something like "thinking the thought of something being true", or similar - something that points to it for you. I suppose there's a luck aspect in ever encountering a situation where the gap is pointed out to you in the first place.

Q3: becoming aware of the background space to your main experience I felt like that out for a walk today - kind of like)(observing the 'bubble' of the universe being seen from the sphere of my awareness instead of having minor reactions/experiences I need to have something big It doesn't matter if your attention is on a small area of the main experience; intention should apply "globally" anyway even if your attention is "local". like for example the portals or even just waking up in another country or in another set of 'life circumstances'. at present it seems like I'm supporting a world for the benefit of everyone but me! even if my 'everyday experiences' were to change around me that would be useful (i.e. they come to me rather than me seeking it out). surely I should get to a point where the difference between intention and actualisation doesn't exist because to desire is to come from a place of want.

Perhaps something to explore is that sense of relationship between "you" and "the world" (including other people). Do you perceive the world as being a place? Or a strand of thought? And so on. Taking on different stances like this changes our basic relationship, the "framing"of the content of experience. For example, if you see intention as being injected into a 3D world that extends out in all directions, then that is quite a different implicit pattern than seeing injection as being a reshaping of your own state from which sensory experiences are a part.

POST: Questions about reality

Higher Understanding

I'd say there is no "higher understanding" in terms of content of experience. The understanding you reach is about the context of experience. Which is: that you are always awareness "taking on the shape of" states and experiences. If you have an experience of "amazing understanding and enlightenment", it's still just another experience. Metaphorically, you are like a blanket of material which can shape-shift itself into any arrangement of folds. So, any apparent intellectual understanding you have, therefore, is also just an arrangement of folds. The deeper realisation is the meta-understanding that "everything is 'blanket' and everything is 'folds'", or that "all sandcastles are both 'the beach' and 'sand'". Note that this is something you can directly notice; these metaphors point to an actual experience of realising that you are a "big open awareness which takes on the shape of experience", with the understanding that even that is a shape you adopt. Basically, though, the fundamental truth is always the fundamental truth; it's not something you discover, it's something you realise you always are (which is obvious when you think about it).

The Ego & The Design of Experience

As regards "the ego" and "the experience you presumably created" - this implies that you deliberately created this experience, that you knowingly chose and designed it. This isn't (necessarily) the case. You've been accidentally patterning your experience all your life. Think of how many times you must have unwittingly done the equivalent of the Owls of Eternity exercise or the Two Glasses exercise!

Furthermore, you don't just get what you intend - you get what your intentions logically imply and you also get the extended associative pattern corresponding to your intentions. The whole world-pattern shifts with every intention, since intention is a reshaping of yourself-as-world. "The ego" is simply a concept, it is the idea that you are a "person", and having adopted this idea, you are having experiences "as if" it were true. The ego cannot assist you; it has no intelligence. It is simply a "dumb pattern" of thoughts and sensations that were implied by prior intentions, and have been overlaid upon your experience. You can't "kill" the ego - at least any more than you can "kill" any other idea by no longer thinking it.

You & Me & World

Yeah, this is always a tricky area. It is not possible to partition consciousness, because it is "before" division and "before" change. Consciousness has no properties other than "being-aware" and so cannot be differentiated, and does not change in terms of its own nature. It is actually meaningless to talk about "pieces" of consciousness and of there being more than one experience. This presents a problem, because of course language and concepts require division into "parts" and then a relation of parts in a mental space. All we can do, then, is avoid making an error - or at least recognise the limits of conceptualisation and know the type of error we are making. The two possible ways are to think of yourself as a consciousness that is sequentially going through every possible experience by traversing a memory block of all possible moments (the Hall of Records metaphor tries to convey this), or that there are multiple consciousness simultaneously experiencing all possible moments. Finally, both versions are identical once we remove the time and space component. The important thing to grasp, probably, is that you are not actually a "person" and the world is not a "spatially-extended place unfolding in time". You can have an experience "as if" that were true, but that is not the nature of things; there is nothing "behind" that experience and it has no outside to it. The metaphor of The Imagination Room tries to give a direct feel for this (if you contemplate it from a 1st-person perspective)

I'd say that you don't get better at intending, but you can certainly get better at choosing and specifying (being somewhat pedantic I know). There's nothing to stop you from attaching a sort of "global good outcomes" property to your intentions; lots of people include a "for the greater good" clause. Remember, "intending" is the intensification of a pattern (the "intention") that corresponds to a - is a - fact. That fact can be, implicitly, anything from "it is true that I am always lucky" to "it is true that my partner and I will get back together" to "it is true that the weather is improving" to "it is true that I am a vast open calm space in which sensory experiences arise". So, if you've intended-asserted the pattern-fact of being open and calm ("like a still picture frame"), then the next step is to experiment with asserting some future outcomes - that is, to assert the fact that "it is true now that I will have this experience then". This naturally implies the creation of momentum in your life. The question to ask yourself is: "what do I desire now?". The answer does not come from thinking it out intellectually; it is an observable truth that is present in your current state. If you ask the question, pause, you should get an answer. Proceed from there.

POST: Quantum Immortality Question

Basically saying you'll live forever.

It's basically saying that one of you will live forever - or rather of the many you-and-worlds one will persist even though all others fail - and that those who die have no experience of dying, because dying corresponds to the end of experiencing. In this scheme, the "you" that's conscious of reading this message right now might well die in a car crash tonight - and end at that point. Another parallel you might not crash and continue. "You-you", however, would still cease. To be honest, from a scientific point of view, I wouldn't take the "many worlds" interpretation, nor any of the other variants which treat the mathematical states in QM as literally existing, very seriously. They aren't actually scientific (there's no test you could perform to distinguish between the interpretations); they are a fun exercise in philosophy, an interesting thought experiment just like Schrodinger's cat, to illustrate a point rather than to indicate a truth. (The cat is not really alive and dead at the same time; the cat concept points out the ridiculousness of a certain interpretation.)

And from a philosophy of identify point of view, this notion of "quantum immortality" is problematic: lots of little worlds with lots of little bodies each with a drop of consciousness inside them, constantly proliferating at every decision point? In what sense are any of those "you"?

This is why approaches like philosophical idealism and dualism flip things round, and have consciousness as primary and experiential patterns as secondary. That way, there is only ever one you which never stops "being" - the context of experience - and never stops "happening" - the content of experience. The experience of being-Duriky_Quide-in-a-world might end, but experiencing itself will continue. Let's call that "context immortality" or persistence of consciousness.

eventually all fundamental particles will be too far away from each other to interact

I'm not sure about this but, surely the expansion of universes doesn't correspond to the separation between each fundamental particle - rather the space between particles? In other words, planet Earth is not expanding as we speak, such that it will one day disintegrate. (So I wouldn't worry about it. Any of it.)

Q1: You make a lot of good points, I don't personally subscribe to a lot of these beliefs but I really enjoy thinking about them. When I was talking about the fundamental particles I was referencing some kind of science article I read online. It was talking about trying to prove the existence of dark matter because expansion seems to be increasing and not slowing down like previously believed. That one day everything will be separated and increasing at speeds that nothing would be in its' visible part of the universe. Energy will bleed off and interactions will cease. Basically a heat death but caused by expansion. Thank you for answer it was really helpful and informative. I think I'll enjoy reading into a lot of philosophy.

I love thinking about these things too. Just always bear in mind that observations are primary, and our descriptions are narratives we invent to connect the dots. We should never think of those concepts as "true" - even though the more we think about them the more "real" they tend to seem - because that's not what science is about. Basically:

- Observations dictate the permitted models.
- Models do not dictate the permitted observations.
- Models are "connective fictions" to link together observations.

Today's best story will be tomorrow's quaint idea that got thrown away for a better, more useful or more elegant one. Dark matter is quite probably the phlogiston or aether of this century, and even embedded theories like the big bang can disappear in a wave of the mathematics. Worrying about dark matter and the expanding universe is like worry about Darth Vader and the Expanded Universe. It's all good fun though.

Extra - On the many worlds thing, you might find this Philip Ball article worth a read [<https://aeon.co/essays/is-the-many-worlds-hypothesis-just-a-fantasy>].

POST: random theory about quantum immortality and deja vu [theory]

[POST]

ok so.. in the time I've been on this sub I've read numerous stories (both here and on glitch) about people dying and skipping over to alternate timelines. These stories fascinate me, and led me to think of a couple things; one being deja vu. If the theory of quantum immortality is indeed accurate, and every time you die in one timeline you hop over to the nearest one, let's think about this scenario. I'm 36yrs old and I die in a car accident, and the next thing I know I'm in another timeline. Things and are similar but somehow slightly different- or maybe a LOT different. This timeline goes on and let's say I don't "die" again until I'm 94, and I die of old age. What if.. what if when we die we are just repeating the same life over and over, but making different choices (or maybe some the same)- and this is why certain things and people are very familiar to us, and perhaps also why we get deja vu? Meaning, we get the feeling we've already had these experiences because we HAVE, in fact, been living the same life over and over on repeat? Until, maybe one day something changes or something else comes along and we're able to move on. Idunno, just was in my head the other day and I thought I'd share it here with some like-mindeds. :)

[END OF POST]

A guy called Anthony Peake promotes almost exactly the theory you've come up with [Is there Life After Death?: The Extraordinary Science of What Happens When we die, By Anthony Peake]. (But he has a higher-self concept in play. Still worth a read though, for some of the interesting stories.)

On the quantum suicide thing, the thought experiment itself doesn't suggest that you hop timelines - it simply says that given a multiplicity of potential outcomes, all outcomes "actually happen", each with a "you". In each death-related situation there's always a chance that you will survive. That "you" will continue on, and so quantum immortality says that no "you" will never experience a death. But some of "you" will die. Personally, I think it's philosophically problematic and it arises from a dubious interpretation (many-worlds) of quantum mechanics. However - if you flip the perspective and have world-experiences occurring within your consciousness, rather than your experiences occurring within a world, then you can formulate it without the multiplicity problems. No timelines, no hopping, no multiple "you"s. Simply stated: "consciousness never stops and experiencing always continues". So if you end up in a situation where your current story has no logical next-moment, then you might experience a sudden reset such that an accident didn't happen, or you might experience dying and going to "heaven", or you might indeed find yourself suddenly at the start of that life again - or at the start of another life - with or without any memories. The ultimate state-shift or dimensional jump, you might say. This seems closer to the varieties of glitch stories we actually see. (Sort of skipping a step as you traverse the grid; perhaps even resulting in some collateral shifts.)

For deja vu, I'm inclined to say that it's due to the current state of the world - all the experiential moments which logically follow from and constitute that state - being available at all times. The apparent passage of time is akin to scanning your attention across a landscape, piece by piece. Deja view is the ultimate peripheral vision, or blind-sight.

I've always been unable to accept that we ever stop existing. Even as a child I remember pondering death and thinking "how could people ever be talking about me while I'm NOT existing somewhere?". I believe these bodies sometimes give out, but some part of us definitely continues the journey.

The traditional approach to this, is to realise that "the body" is actually just a bunch of sensations that arise in the mind (or, because that word has developed muddled meanings, that arise within the "open perceptual space" you experience yourself being). Sensations come and go, but the mind remains. This puts a different slant on things like dreaming and death. So, we end up with something like: consciousness persists, like a blanket of material which has folds in it, where the folds may change shape or even be ironed out completely, but the blanket itself remains. The only thing you know for sure is being-ness, that feeling of existing. That is fundamental; everything else is relative content.

Q1: Its a cool idea to ponder with your buddies over some beer and a joint, but I read something that explained it. Don't quote me on this, but Deja Vu is somewhat of a memory lag. Your brain decides to put your current experience into your long term memory, which gives you the weird feeling that "this has already happened" because you're reading it from your long term memory at the same time that it happens. But idk man. I've had some weird deja vu before. Like when you somehow remember what someone said, as they're opening their mouth to say it. On a subjective level, it definitely seems like Deja Vu is something more.

I'd heard that too... but to accept it as an explanation, you really have to ask how, exactly, that process works. Otherwise it's another "cool idea" to ponder with buddies and beer. Not that that's a bad thing though. Any excuse, I say.

That's a good attitude. Lots of people just accept an explanation at face value without bothering to look into the mechanics of it.

Yeah, I'm often surprised at how flimsy is the evidence or reasoning behind commonly referenced ideas. In psychology, it often takes the form of applying an explanation to scenarios way beyond the context of the original studies. In science, it takes the form of taking interpretations as fact, or extrapolating greater certainties from small successes. I think: Why believe anything? Just keep to an "open verdict" if you can't confirm things for yourself. It'll all probably have changed again by the time you get around to reading up on it anyway. :-)

Nothing wrong with exchanging interesting ideas though - the more of that the better. It's just about avoiding feeling obligated to assert those ideas as true, rather than useful.

Q1: Read Prometheus Rising. It's barely related to what you're talking about but I can tell that you're the kind of person who would really enjoy it. Changed the way I think about everything. "When we meet somebody whose separate tunnel-reality is obviously far different from ours, we are a bit frightened and always disoriented. We tend to think they are mad, or that they are crooks trying to con us in some way, or that they are hoaxers playing a joke. Yet it is neurologically obvious that no two brains have the same genetically-programmed hard wiring, the same imprints, the same conditioning, the same learning experiences. We are all living in separate realities. That is why communication fails so often, and misunderstandings and resentments are so common. I say "meow" and you say "Bow-wow," and each of us is convinced the other is a bit dumb"

I've read it! That and, I think, his book Quantum Psychology were a couple of my favourite "what's this 'reality' thing all about?" type books. That's a great quote.

POST: On the pretentious nature of consensus reality.

All wool, no sweater!

POST: Visualizations of a few concepts discussed here

[POST]

Recalling or experiencing part of a pattern in any way triggers the whole pattern (and to a lesser extent all associated patterns) via auto-completion.

[<https://i.imgur.com/gGmwmQe.gifv>]

Unfolding

[<https://i.imgur.com/QB7IEAp.jpg>]

Enfolded Possibilities

[https://3.bp.blogspot.com/-WpGzXw4z05I/UysaV4CAyfl/AAAAAAAAukQ/OwY03ii0I2k/s1600/tumblr_m39qj6mK6v1qzt4vjo1_500.gif]

I may find some more in the future, but I felt these were fitting, at least for how I think of these concepts.

[END OF POST]

What a nice idea - evocative imagery. I kinda meant to pursue that avenue more after the Infinite Grid one, but animation takes time and I've not had the time - repurposing preexisting ones is a great idea. I like the first one particularly. Something which emphasises the notion of a redistribution of relative contribution of pre-existing patterns. This also reminds me I've been somewhat neglecting my Oneirosophic duties of late.

POST: Cities, civilization, and lucidity.

[POST]

So i've been on a two week vacation out in spain with my family, and while it was fun, i cant help but realize in those big city environments, not to mention not having much alone time, i had a very difficult time achieving lucidity. Like before i left i feel like i had things down but out in madrid and barcelona, all of the hundreds of people and noises seemed to scream for attention for my mind. I guess i could classify myself as a person who is prone to sensory overload at times. Also on the whole going beyond being human thing, as much as i love my parents being around them seemed to make me feel human by reminding me i'm their offspring. What i have learned from this experience is that for one thing i now know why monks spend time in isolation, but also that there is incredible freedom in solitude. I've also realized that before i thought spending time alone in my room was limiting and imprisoning, but when i was out in those big cities i felt even more imprisoned and failed to realize how free i actually was before this experience. Say what you will about charles manson, but in ones of his interviews he said something along the lines of society being a bigger prison then the actual cell he was staying in, and now i totally get it. Mental prisons are much more insidious because not being in a physical prison creates an illusion of freedom, and mental prisons can be very detrimental to lucidity.

[END OF POST]

Madrid and Barcelona - amazing, I love those cities. But they are relentless. And that's a good thing! :-)

Surely one of the benefits of pursuing this approach is that you can find the 'space' in any situation. Even in a crowded street, elbows bumping against you, the rowdy crowds of Las Ramblas, there is quiet inside you - or should I say, that the scene is contained within a quiet. Monks are saps! ;-)

EDIT: Hint, these cities are much more fun with a bunch of pals, perhaps during a festival.

...my dad kind of follows a schedule...

Yeah, there's nothing worse than "organised fun".

i brought illuminatus trilogy on the plane to read and the person in the row next to me had the same book.

Of course they did! That's how it works. Also, your seat number was 23 and the air hostess was distributing free copies of Fnord magazine with the newspapers.

POST: TV astral projection, dimensional intersections, and reality as a dream labyrinth of dreams within dreams.

Yes, we do get "absorbed into worlds" (or rather, we absorb worlds into us?) and everyday life is just such a place. I suppose we become what we pay attention to, so we really do completely enter Mario's land. It's just a matter of directed attention.

A little related, I was just reading Francis Lucille’s The Perfume of Silence and I quite liked this passage (his version of a ‘grid of all moments’) which reminds me a bit of your TV scenario:

*We can only use metaphors up to a point. When stretched too far they don’t work. We use the metaphor of images on a television screen to understand the relationship of thoughts, feelings, and perceptions to consciousness. The screen stands for consciousness, and the images for the manifestations, the energies, the appearances. If we want to understand the relationship between consciousness and the apparent multiplicity of minds, we can also use the image of a television screen, but in a different way. If innumerable television screens, each with their own image, represent innumerable minds, then in this case, consciousness is indicated by an observer who is watching all the television screens at the same time. Sometimes two images may have some connection because they share a common object. Sometimes they may not seem to have any connection, because their fields don’t intersect. However, one single witness observes all screens. In this metaphor the witness stands for consciousness and each screen stands for each individual mind.

and

Objectively it is limited, but subjectively it is not. One television screen cannot see the other screens, but the observer has access to all of them. In the same way, your mind does not have access to other minds, but one consciousness sees all minds. The observer is not foreign to you because it is you. It is seeing and understanding these words right now. There is not a separate consciousness for each mind. There is only one hearer, one seer, one perceiver. The apparatus with which we see is by itself inert, unable to see. A telescope is useless without an astronomer behind it. It doesn’t see anything by itself. Likewise, the apparatus of mind doesn’t see anything by itself.

POST: Differences between Oneirosophy and New Age (by cosmicprankster420)

[POST]

You know I consider myself pretty open minded when it comes to forms of spirituality, but whenever I see something that is really new agey there is a part of me that cringes a bit. I mean I believe in the possibilities of things like spirits, energy, and alternate planes of existence and so do new agers, but where is the difference? What's different I realized is that new age can have a quasi materialistic bent to its working where as Oneirosophy is all about working with perception alone. For example things like fluoride in drinking water calcifying the pineal gland so you cant astraly project, needing to be a vegan in order to access higher states of consciousness, masturbating makes you lose your chi, or the idea of electronic devices interfering with ones perception. All 4 of these things have you believing your ability to transcend the illusion of physicality relies on other physical things. If that doesn't sound like it makes sense it shouldn't. If the world is truly a dream things like chemicals in the drinking water or having the right crystals in the room should not be an aid or a detriment unless you decide it so, all is perception. Now granted getting to mired in certain habits can make one less lucid like eating too much junkfood or any other habit, but that is only the focus of attention on the bad habit not necessarily things blocking your chi (unless that's how you want your reality to manifest). Let me make it clear I'm not trying to attack new age, if you want to clutch crystals and eat only raw food that's your business in your spiritual path but I think the reason new age can be off putting at time is because it makes spiritual ascent based on physical diet, physical objects, and physical energies where as oneirosophy can be based on perception, attention, and thought forms alone. I mean im not a vegetarian by any means (though I am eating less and losing weight currently) and I think im pretty good at astral projection and visualization. You don't have to worry about adopting some ultra healthy hippy life style (though diet and exercise doesn't hurt), you always have the power within you to become lucid in this dream, just don't get too caught up in the side shows and you should be fine.

[END OF POST]

What's different I realized is that new age can have a quasi materialistic bent to its working...

Yes, there's like an acceptance of 'this' but not of 'that' - as if there's a requirement for some solidity to base the esoteric stuff on. Which isn't the case. Everything gets much simpler if you accept that everything is non-material and aware, and therefore infinitely flexible.

If the world is truly a dream things like chemicals in the drinking water or having the right crystals in the room should not be an aid or a detriment unless you decide it so, all is perception.

I was recently reading a book on "Ho'oponopono", quite new-agey (albeit describing a traditional Hawaiian approach apparently) but with some universal ideas buried in it. Anyway, at one point our main character in this asks to go to a burger bar. Our author is surprised - surely this unhealthy food is a bad idea? The response is that he 'sends it love before he eats it'. Now, that sounds ridiculous, but then you realise what he's really saying is that he is refusing to accept the idea that the burger is bad for him. He isn't cleansing it of bad energies or whatever; he is cleansing himself of his own causal opinion that this will do him harm.

Simultaneously, it is becoming apparent to me that much of what before I would feel very much a victim of, now I simply take in stride and learn from.

The larger idea is that we can cower and "be small" within our world-experience, or we can assert and become it - in which case it is within us. When the world is within us, it is not made of "things" but of "meaning", and events unfold according to their meaning. If burgers and coughing "mean" to us that health is affected, it will be. However, if we note that burgers and coughing are merely images in awareness then they don't inherently mean anything, and we can update any meaning those ideas have inherited from our past assumptions. I guess you could call this "Active Being". In many traditions we are taught non-attachment and acceptance. This alone reduced the effect of such things. However, we do have the ability to "reformat experience" and change the "rolling theory" we are living with - interjecting when we spot a tweak that needs to be made, and letting be at other times.

this is where the idea of gods or the hga becomes useful.

This is a good point - that if you can't quite persuade yourself that "little you" has all this power, then you can outsource it as a way of convincing yourself it's possible. But that is what you are doing: creating-adjusting by implication. It's pretty hard to convince yourself that: a) you can completely cheat the game and, b) that cheating the game is a 'good idea' or morally 'allowed'. And doing things by direct assertion (including 'overwriting yourself') maybe the most direct and it does work, but it involves at least temporarily leaving personhood behind, which is a pretty big emotional hurdle (it's "death"!)

POST: Pain doesn't hurt anymore

Do you feeling more generally detached and less present in your body? Do you feel more 'localised' in your head area?

Not saying this is you, but - - -

One reaction people can have to emotional trauma is that they withdraw their 'presence' from their body; they become remote from both emotional and physical sensation. Any distraction from the 'avoided area' can come across as having ambiguous meaning, anything intense that breaks through can seem pleasurable - e.g. Being forcibly hugged really intensely, etc. Mostly, it is that for such a deadened person, any intense sensation can give a feeling of 'aliveness' again. In other words, if that is you, then this isn't a good thing. Spiritual learning allows you to feel things fully and accept them as sensations; it doesn't literally reduce the sensation itself or deaden the natural response. 'Letting go' and 'mindfulness' exercises might assist, although you might find them initially unpleasant and make you feel vulnerable, because you will be opening yourself up to sensations you've not been with for a while.

I am not detached from my body. Also not deadened or less present in general. I experience primarily through my heart and root chakra zones. I made this post out of surprise that an incidence of physical pain didn't carry that repulsive feeling usually associated with pain. I thought maybe the recent emotional pain could have some bearing but I hope people don't take this post as a cry for help, because I'm actually feeling great.

Ah, well that's all good then! :-)

POST: Everything is real, everything is unreal, or everything simply is?

It depends on the perspective. Everything is unreal in the sense that it is not what we assume - no solid objects extended in space, actually patterns in dissolved awareness. But they are real in terms of being patterns. So perhaps it's better to dodge the question and just say that everything is transparent and dreamlike?

From there it follows that as there is no solid substrate, everything is temporary and flexible, and because to experience something you must be it, all experiences and therefore the world are contained within you. "Real" and "unreal" means the world experience is being separated into two categories. But really, all experience is made from patterns of the same thing (awareness). The distinction between the two is, on examination, usually down to stability and persistence, and perhaps location - that transient thoughts are "not real" (and over here)whereas the room around you hangs around and is therefore "real" (and over there).

- If real = an independent physical material, then nothing is real.
- If real = awareness, then everything is real.

From a /r/Psychonaut post:

Nefelibata

Definition: A cloud walker; One who lives in the cloud of their own imagination or dreams, or one who does not abide by the precepts of society, literature, or art; An unconventional, unorthodox person.

Pronunciation: ne-fe-LE-ba-ta

POST: Understanding Beta, alpha, theta, and delta mind states in an oneirosophic context.

Could we think of the brainwaves as the 3rd-person subjective image of a 1st-person subjective experience? Is the difference between states then a different between attentional styles?

Two general styles:

- A diffuse, open attentional style is a detached one where you let the world experience come to you. You are settled into the broadest state. This is an acceptance of existing patterns though non-resistance.
- In contrast, a highly focussed, narrow attention style involves a "gripping" onto a pattern. If this is a pattern of existing experience, this this increases the intensity of the pattern within focus, but also preventing its change.

However, either style can be used to effect change:

- An open-detached style (non-clinging to existing pattern) can allow intentions to ripples into effect easily. You are not "holding onto" existing patterns, so they can reform without resistance.
- A narrow-focussed style, when focussed on the desired pattern rather than an existing pattern, can also be a mechanism for change.

Implicitly, both approaches can amount to releasing a hold on present patterns and transferring experience to a desired pattern. The open approach is far less stressful though, and you can have a focussed experience within an open state.

Q1: ok this isn't a bad way to reinterpret it. I tend to find the open detached style is better for cultivating a state of lucidity then the narrow focused style. Maybe this is because you become open to the whole experience, and to be truly lucid in a dream you have to be aware that all of the experience is a dream, not just one small section of it.

Right. I'd say the open detached style is definitely the one to go for, because you can (potentially) live every moment this way. By "letting the world come to you" you can remain completely relaxed. If you don't even interfere with the shifts of your own attention (which eventually settle anyway), you naturally become aware of the background space including the place where "you" are meant to be. The narrow-focussed bang has been used in magickal techniques as a quick way of forcing temporary detachment while holding an intention, to "release" it. But surely it's far better to be completely open and "ask and receive" instead - for everyday body movement and thinking, not just "special efforts". I guess it's about resisting the urge to want to push and feel yourself doing things. There have been some studies into the correspondence between brainwaves and "open focus" and there is value in that - see Les Fehmi's work - but for individual experiments, I think you can just go for what feels right.

...

that is a good point you make, however i know in my own personal experience i still have a lot of deconditioning to do. I only say this because i have become lucid and then have become trapped in materialism before and know how hard it is to get a way from convention.

Can you instead put aside those thoughts and then, rather than de-conditioning, leave them alone and choose to assert your preferred metaphysics and live from that?

POST: Sensory Reversal

[POST]

This evening I imagined, "If the physical world is an illusion, how can I come to access the world beyond illusion? Senses are all no-go's. What else do I have to work with?" And I thought, oddly enough, of senselessness.

So I closed my eyes very, very slowly. I watched as my vision, which seemed to take up the entire potential visible field, began to develop definite 'edges' The top and bottom of my visual field started to disappear into the lightlessness of closed eyes. And soon what remained of my vision was just a tiny, trembling flicker surrounded almost entirely by lightlessness until my eyes finally closed entirely. And I'd do this again and again, very slowly opening them back up, and very slowly re-closing them.

I started imagining an image of myself with two tiny, round TV screens floating in front of my eyeballs like the lenses of eyeglasses. And each of them was showing me a very slightly different perspective on the world in the same way that 3D glasses do to present a 3D movie.

And the interesting part really began when, as I slowly closed my eyes, I would imagine the screens compressing horizontally until they dissolved away, and as I slowly opened my eyes, the screens would emerge again and slowly expand. And I held this visual in my mind very strongly and probably spent no less than 15 minutes imagining that, as I felt my physical eyes close, the 3D screens were dissolving. I recommend you do this and pay special note to what you begin to 'see' when your eyes are closed. The sensation settled in that as I closed my eyes, I was effectively opening my actual visual field to the "genuine" world -- and naturally when I felt like I was opening my eyes, I was actually covering up the real universe with a virtual screen.

What are the implications of this approach?

Well, it implies that the emptiness you see when you close your eyes is kind of "more real" than what you see when your eyes are open. This means that total sensory deprivation, including thoughts, would be the effective extinguishing of the physical world -- and also, therefore, might share similarities with the state of mind of an enlightened being. This may be intuitive, **but what's (I think) profound to imagine is that what's left, the dark, scentless, tasteless, sensationless, thoughtless world you'd experience in total sensory deprivation, is precisely the state you return to in deep sleep, certain states of meditation, or death. When you close your eyes, you're looking at the "Real World" beyond illusion. The only illusion would be to imagine that you're seeing the backs of eyelids.**

I found this to be very powerful to experiment with.

It also confirms strangely well with the scientific approach to the world which should make this practice a fairly accessible one for even skeptic-minded folks. Everything we experience, according to physics, comes at us as wavelengths of some sort. All of matter, all of our sensory experiences, all of existence, boils down to wavelengths. It's therefore, potentially, fairly easy for even the uninitiated to imagine their whole perceived reality as merely the massively complex wavelengths projected by a hyper-advanced 3D screen. Of course, it's hardly intuitive to imagine pains, scents, and visions as being projections of wavelengths, but it's approachable and comprehensible, I think, to a broad audience.

Another very interesting thing that can be done with this practice is to, while sitting in a dim-to-dark environment, perceiving all of the dark spots in your field of vision (shadows, black objects, etc.) as 'holes' in the screen. The nature of the visual field suddenly becomes very thin, 2D, and almost transparent.

Thoughts?

[END OF POST]

That's a fun approach. Like realising you've been wearing VR goggles all along. |8|-)

The Imagination Room metaphor was an attempt at something similar: to give you a way of looking at things which you can take around with you, seeing the sensory world as a floating mirage in the undefined space of...

The better version would be a "holographic space", but having the projection come from the "floor" is something that can be used to keep you, ahem, grounded during daily life.

An H.S. is kinda what you're approaching here?

Everything we experience, according to physics, comes at us as wavelengths of some sort.

I'd say you can ditch the "wavelengths" part, because one of the steps everyone has to take eventually that scientific experiments are just part of the sensory dream, as it were. And in any case it appeals to a more scientific crowd. "Observing wavelengths" is a story we experience that is made up of sensations and perceptions, so -

Instead, you can simply point out that sensations (images are harder, but sounds, bodily sensations, thoughts, emotional feelings) are all "findable" floating in your own awareness. You can literally sit someone down and take them through this, directing their attention at the different parts of experience, and they'll "get it".

What are the implications of this approach?

Vision is always the trickiest though, because it seems so obvious that "spatial extension" is a real thing outside, when it isn't. Your idea of imagining it as 'TV screens' you can push away is a good way to have people "stand back in their heads" a bit at the very least, maybe even actually learn that the visual content can be directly manipulated...

But what I'm really implying is something that goes beyond screens into a full sensory hologram.

Right! I do think it's easier to introduce the simpler version first - the "floor" in my room, the "screen" in your description. Because:

When we switch to talking about a holographic space, we're saying something a bit more: that the whole of the world is dissolved (non-spatially, non-temporally) into the background awareness, and that your 3D sensory experience is just what you are currently "selecting" with your attention. And by "the world" here, we really mean the patterns that we've accumulated within ourselves, as that space.

"You can literally sit someone down and take them through this"... I like that.

I'm always on the lookout for ways to communicate this. Another fun thing to try with people - which has worked pretty well - is the little exercise described in the post Outside: The Dreaming Game. It draws people's attention to the background space that they are. A variation on that is the "where is your real hand?" exercise, where you get people to try to point to their "real hand" (having explained that, even under the standard description, what they are experiencing right now is at best a "mind representation" of the world). If they point to their head (to indicate their brain), you ask them where their "real head" is...

The best approach, I think, remains simply lying down and giving up completely and absolutely. Vitally, this includes releasing your attentional focus to let it move as it wants - this is the real key. Given some time without being stirred by intention, the "space" settles out and naturally reveals itself to be open and unbounded. Looking for this interrupts it by deforming the space via attention; thinking-about this obscures it with the shadow-senses that constitute thought. This is why the whole "seeking" thing has to be dropped in order to be "enlightened", I suggest.

reading this post I pictured my vision as a 3d bubble in a 4 dimensional void, powerful stuff. But I would be somewhat cautious to labeling said void as "the real reality".

That's how I envisage the Infinite Grid thing. My current sensory experience is my 3D attention scanning over a 4D environment. It's always the the 'real reality', right? Just taking on different forms. Even 'void' is an experience of some sort.

POST: Some more lucid dreaming epistemology

I was talking about this over at /r/luciddreaming, responding to a post about persisting the dream (via spinning, looking at your hands, concentrating on a sensation, etc). Here's my comment:

My feeling is that all of these techniques are indirect - but they all have something in common. This occurred to me a while back when trying to improve my posture, and I realised that all the bodywork techniques were really about... expanding your feeling-sense or presence into the space around you, and everything else falling into line spontaneously. In short: maintaining a relaxed, open awareness that is expanded into the perceptual space around you. What you actually seemed to "do" to bring this about - a body action or mental manipulation - was irrelevant: you could actually just skip straight to it. In lucid dreams, if you let your attention narrow down into the body area, it's a sure-fire way to end the dream. Warnings not to contemplate the dream are essentially warnings against this. Maintaining tactile sensations, spinning around, looking at your hands, is a cheat to keep your attention open. (Implication: it's perfectly okay to think in a dream, so long as you don't mistakenly assume this requires you focus your attention down to the thoughts, thereby withdrawing yourself from the dream environment.)

So, next time you are in a dream, try expanding your sense of presence - expand your "you" and feel out into the dream, to that you are in open focus rather than narrow focus. Note, it's more of a relaxing-out than a forcing-out. Open attention is actually the default once you've got used to it, so what you are doing is leading yourself to cease constraining your attention. You can also try this in everyday life, since the situation there is exactly the same (except for the sensory content). What you'll discover is, your true situation is that of an "open, aware, perceptual space" in which experience arises - whether that's a waking experience or a dream experience. (This realisation allows us to make sense of experiences such as these [Darkroom Vision & Chef Hats & Dreams].)

The summary: avoid narrowing your focus when you do anything. Leave your focus open. This is a mistake we do in real life too (we "concentrate" our attention when performing an activity, rather than simply intending it).
...

The waking dream is dreamed that way; you've dreamed that you-the-character are restricted; experiments reveal this not to be the case. You can choose to dream a persistent, permadeath realm as a lucid dream if you want, and it will be pretty much like this waking life.

POST: Trying to hash some stuff out for myself, would appreciate your thoughts.

How does the oneironaut remain committed to any view in particular?

You get to choose your metaphor deliberately, and having experiences accordingly. It you don't choose or if you botch together an incoherent worldview, you'll find yourself in an incoherent world.

I think I'm just not convinced that manipulating reality is worth the effort because if normal and mundane things aren't real, why bother with trying to change them?

Well, they are only "not real" in the sense that there is no secret, hidden, solid world behind the scenes beyond the "habitual regularities" of experience. It's perfectly real as an experience, in the same way that a thought is a real thought. You can just leave things alone if you want, let your current patterns roll on...

But still, it seems like I actually can't stop manipulating reality.

You can let it alone by not updating anything (the apparent world will just run along its current trajectory). Experience will just appear in alignment with the facts-of-the-world as you left them. But it's also important to realise that you can't experience yourself doing the changing. To will is to change your own shape; you only ever experience the results, although you "know" that you are willing.

Basically I feel like there is no ground for me to take a position on that would make me feel that one way of perceiving reality is ultimately better than another.

Just choose one. For fun. You don't need to believe anything (belief isn't causal, it is simply what one thinks is worth intending, or assumes is happening anyway). You are right that there's no ground. Even your current "you" perspective is arbitrary.

There are no answers, only choices [https://www.youtube.com/watch?v=aeC285uL6_w].

it's just that I have been taking "enlightenment" so freaking seriously

Let "enlightenment" take care of itself. Or: sit down and close your eyes and imagine that you are the empty space of the room, then expand it out. Don't think-about being that, instead actually imagine being it, adopting the shape of being it. Keep doing that until all you are is empty space. That's not quite it. :-)

But in waking life I seem to forget about this.

We let go of many things but often we forget to let go of attention. Check whether you do this: when you are doing something, such as looking at a computer screen, do you narrow your experience to it (focus your attention on it) or do you include it into your experience (leave your attention open)? Try the latter. Notice that you do not need to narrow your attention ("concentrate") in order to achieve things. It is intention that dictates what gets done, not attention. In fact, you'll maybe realise that the usual reason you narrow your attention - to block out distractions when trying to "focus" - is actually caused by narrowing attention. Distractions are actually a "here I am" signal to open out attention again, as are aches and pains, often.

Q1: This is interesting. I have noticed more and more that I feel like I am sometimes being sucked into the screen and I find myself straining or not paying attention to anything else. It's gotten to the point where when I'm done, I feel out of it. Like dissociated and separate from things. It's really uncomfortable. Do you have anything else to say about this?

I went through a similar thing. I suggest that, if you don't already do something similar, you adopt a daily exercise like the passive version of Overwriting Yourself. Basically, just lie down and let yourself - but in particular your attention - unwind without interference. If you narrow your attention down, what happens is that your whole body effectively tries to cram itself into that small space! You get very tense, and your body often ends up in what amounts to an emergency mode. Even people who know about "letting go" of their bodies and thoughts often don't realise that they are still controlling their attention, because attention isn't a "thing" or a "sensation", it's more of a filtering.

You shouldn't be controlling anything through effort. Your job is to "direct" and "let happen". So my general advice is:

- Before working, imagine yourself to be the background space in the room - actually "feel out" into that space.
- Rest the centre of your attention - "where you are looking out from" - somewhere along the centre line of your body. Perhaps halfway back in your head, or even in your lower body. Wherever feels good and like "home". (Probably at the moment you are "sitting" too far forward, right behind your eyes.)
- When you work at the computer, do not focus your attention onto it. Instead, leave your "space" open and allow your body to move at the pace it wants to.
- Do not not "effort" yourself. You are not meant to be physically wrestling with your work. If you leave your attention open, you'll probably find this subsides naturally. If you are in a calm state, you should feel that your body is "moving by itself".

I mention this all the time, but for daily body use I really recommend the Missy Vineyard book. Although it's ostensibly a book about the Alexander Technique (body use for actors, musicians, etc) it's actually a lot more insightful than that.

...

Hey, that's great - the attention thing is hard to describe, but once you've had the experience it all makes sense!

EDIT: You made a good point, which is that it's tempting to try and hold onto effortlessness or spaciousness by focusing on it, but of course that ruins it. You obviously can't "hold onto" wide-open attention by narrowing your attention.

POST: Dream is interesting

Have you checked out /r/luciddreaming? You might find that interesting if you haven't. Also I really recommend the book Lucid Dreaming: Gateway to the Inner Self by Robert Waggoner, it this area is new to you. It's probably the only non-beginners book on the subject that delves into the philosophy and status of the dream environment.

Yes, it's interesting to think that we might have given ourselves this role and forgot about it. Part of oneirosophy is recognising that you are "the dream" rather than the particular character you seem to be. If you've been practicing Buddhism and meditation, then I'm sure you've been thinking along these lines before: that what you truly are is a "consciousness" which is "taking on the shape" of a being-a-person-in-a-world experience.

i am the dream.. it also seems to mean that we are one with the world and the world is within us. if i understand you correctly.

Yes. Without getting in depth, I'd say that what we actually are is an unbounded "aware space" in which all possible experiential patterns are "dissolved". The moment you are experiencing now is just the combination of the various patterns that are active, the brightest of the patterns. You can think of this as similar to how the sun (the current moment) dominates the daytime sky, but actually all the stars are still there (all the other possible moments). This means that there is no world "out there". For instance, the room next door isn't "over there", it is dissolved into the background, here. Our ongoing experience is like a *strand of thought - it just happens to be a very bright, 3D-immersive stand of thought that seems to fill up our aware space. I've posted a long-winded version about this stuff before: The Patterning of Experience and A Line of Thought, maybe worth a look in a bored moment. The "imagination room" metaphor linked in the first post can be quite useful I think.

if the dreamer here could travel the same world we are currently residing? or the dreamer always travel in the dream realm outside the world we are residing?

I say there is no restriction. There is no difference between selecting an experience "somewhere else" or "here in this world" or even "another time in this world". It is all here, now, available. The trick is to ensure you are starting a "thought" which is seeded from this world, rather than a random creation.

POST: Anyone finding progress?

"Just deciding" is an assertion that something is fact. More specifically, it is like increasing the contribution to your experience of a pre-existing fact or pattern. (It is pre-existing, because it is thinkable; all patterns exist eternally.)

For all the reasons you identify, it is much easier for people to use misdirection for this, and use a mental or physical act and attach the meaning to it. In other words, we think a thought or perform a ritual which we have decided means-that a situation will occur, or that a fact is now true. (And we choose not to examine too closely that the thought or act itself came from nowhere.)

Elsewhere, I tried to encapsulate it with these snappy bullet points:

- Act + Intention + Detachment = Shift
- Assigning a meaning to an act is what gives it causal power.
- Assigning a meaning to any experience can give it causal power.

The problem you might be having is that this is all literally unthinkable conceptually, and you cannot experience yourself "doing" intention - you can only experience instances of it, of becoming it.

One possible illustration: if you were a shape-shifter, how would you describe the process of shape-shifting? You would just "become" the new shape; it's all you, so there's no one part causing the other part. Continuing with this: how would you work out you were a shape-shifter? The only way would be... to shift your shape. There would be no evidence of you being a shape-shifter between shiftings. Intention and deciding and all that, have similar problems. You are perhaps seeking to experience something that is "the thing 'before' experiencing".

POST: on accessing harmonic understandings in music without "learning" scales, chords, etc

Reminds me a little of this: Working With A Violinist [missing]

But that's just about allowing the physical movements to flow uninhibited and in the best way possible (without "making it happen"). That's an arbitrary limitation though, surely, borne of an assumption which limits intention. What's the difference, really, between intending to play a piece of sheet music and "letting it happen", and intending to create a new piece of music and letting that happen? It become about not obstructing what arises.

POST: Donald Hoffman: Do we see reality as it is?

I do like Hoffman. His paper on Conscious Realism is worth reading, and slightly more sophisticated talk on the Interface Theory of Perception is well worth checking out. Another Hoffman link to check out: Peeking Behind the Icons, from his older book Visual Intelligence. It's basically a sort of modern-language retelling of Immanuel Kant's phenomenal and noumenal. Of particular interest from the perspective of subjective idealism:

Are my teammates conscious?

The phenomenal teammates are, like the phenomenal volleyball, my constructions. If the phenomenal volleyball needn't be conscious, then why should my phenomenal teammates be conscious? What differentiates the two? For now, nothing of import- ance, so I can't conclude that my phenomenal teammates are conscious. My relational teammates, like the relational volleyball, are circuits and software. But these circuits and software receive radio signals from my "real" teammates who are conscious, so that ultimately I interact with them. Thus the relational teammates are conscious, although my phenomenal ones are not.

Potentially this is rather begging the question, because in reality we don't have access to a "pre-simulation" version of what's going on, as described in Hoffman's metaphor. Whatever it is that dictates the behaviour of my "relational teammates", whatever has set them in motion, can never be accessed. Unless it turns out that this is... me.

...

It's important to realize what Donald is talking about is not subjective idealism.

Yes. This is true, but he does skirt with it elsewhere, because he doesn't consider the world as spatially-extended, and starts to suggest that individual perspectives can be separate. I wouldn't be surprised if he does something on it eventually - but it's a step that pretty much no public figure can openly take at the moment, because it just can't be proved by "given" evidence and has no context. Anyway - I find his step-by-step discussing and imagery pretty helpful in providing a path out of materialism certainly, physicalism definitely. Especially initially, it can be difficult to make the step from "knowing" a subjective idealist perspective but being unable to "think it". Donald's pretty helpful for this. But of course: each to their own. As you've pointed out before, it's usually helpful if a link is accompanied with some discussion on how it's helped you to shift your perspective, etc, to provide context.

Q1: Subjective idealism can never be proven using evidence. In fact, subjective idealism finds fault with evidence itself. Meaning, we cannot accept appearances as evidential because of our metaphysical stance. Appearances present us only with possibilities and not with "how things are." There is no "is-ness" behind anything. So how can such appearances serve as evidence?

I find his step-by-step discussing and imagery pretty helpful in providing a path out of materialism certainly, physicalism definitely.

I don't agree. He just refines it, but doesn't do away with it. He uplifts physicalism to a realm beyond appearance, but still keeps all the bad features of it intact: objective common ground and in-time causality. This is something the scientists have always done. They've been refining their physicalism. They started with the billiard ball idea of

atoms, then refined it to "almost empty space" but notice, they never say 100% empty space, it's always "almost." Etc. So they refine it. Now they have a notion of virtual particles. Now they think particles and waves are not two distinct things. They keep refining it, but they'll never rid themselves of the constraints of objective common ground or in-time causality, because they base every endeavor of science on those assumptions.

I think Hoffman is further along than you think, but your points are valid. The extra bit: having recognised that there is no inherent meaning, no possibility of evidence, we become far clearer about the will. In fact I'd say it only makes sense following those other insights.

What amazes me these days is how I used to get worked over about will, but after I realized will is always-on, I can just relax and stop working myself over like a fool. I am always willing perfectly and naturally. I don't have to work myself over and will on top of will, so to speak. Taking relaxation into the scope of volition, and removing the start/middle/end times for intentions, that's done wonders for my state. Now I exert myself as if passive and I relax as if active. It's great. Activity and passivity are only deceptive appearances. I needn't be fooled by them.

Yes, you and I disagreed (it seemed) for ages about will being always-on, but it was primarily a language disagreement because of this exact thing - the hidden assumption we can make about "efforting". But of course, once there is a willing there's a pattern change which persists it, and is it. Passive = active.

Q2: In this talk he's specifically saying that reality is group-perception generated and then at the same time generated by one and then understood by many misinterpreters. Also, that misinterpreting doesn't matter for life. So it's quite contrary, but that latter idea is surely clear. I'd say that he's reserved in what he says IF he truly thinks more than what he says. I don't care if he does or doesn't, but it was definitely an interesting and well spoken piece. What's amazing me at this time in our lives is the convergence of this idea that thought and will make. It's becoming in young art that's being endorsed by corporations. That means it sells, but it also means that massive amounts of people respond to this type of idea.
I'm starting to get a little hope for humanity in that numbers of people aren't jumping on board with a school of thought, but are getting into a deep headspace of creativity and experience on their own terms. I don't know why we chose this idea to experience, but I imagine that it has to do with procreating consciousness in the from one many are begotten sense. I genuinely think that the smarter parts of the general population are starting to get it. The, "I am I" and the "Thou art" and the "We are". I expect to see a lot more people "coming out" in this regard in the next few years. It's time that everyone was told point blank and has to fess up to the responsibility that we're all truly that thing that people deem worthy of worship.
Check out this young man [<https://www.youtube.com/watch?v=bPt0LkdM8Bc>] but shit, this might all be lame in another few years.

There's a good conversation with Donald Hoffman somewhere (will try to find) where he's sat having a coffee with a colleague, and they talk about how there's no way he could have gone into all this "consciousness" stuff until he had tenure and was safe. As time goes on though, I think it's going to become acceptable again to explore this stuff without ridicule, as even neuroscientists like Christof Koch are publicly discussing panpsychism, etc, as a solution to the hard problem of consciousness.

POST: Insights from Music

A1: I think the illusion is, is that you're never not in flow. The whole of experience is one big flow. Every thought, every movement, every breath, just happens, naturally and without effort. Even the discomfort and disregard and pounding and your flailing wildly, just happen, without effort. Even the illusion of not being in flow, is a flowing experience. The way to be in flow all the time, is to become aware that you already are. And hopefully, you just have.

Great!

POST: I'd like to correct something I said in my last post

It's worthwhile, I think, to distinguish between passing thoughts (which we might say arise from the current state) and intentional thoughts (which we might say are amendments to a patterns's contribution). So, passing thoughts don't matter, but intentional thoughts do - and what matters is the contextual meaning of those thoughts beyond just the standard sensory aspect. For instance, you might conjure the image of an owl in front of you. Now, do this for "an owl" and do this for "an owl next month". The visual and auditory aspects might be identical in each case, however the felt-knowing of each will be different. Relevance to the topic? That you don't need to let go of the idea as such, but the details matter. If the context of your idea is "an owl will happen soon", then holding onto that idea persists it as never happening, since you are continually re-asserting the fact of a future experience. Also, when you do something you can "know that it is done", thus implying its persistence, and then not have to continually hold it in attention. If you have the idea that ideas are transitory and need maintained while doing your intention, then you are implicitly intending that too, potentially.

POST: Solidity is reinforced through continuity

My theory is that we tend to live in a primary default dream and occasionally dream secondary or tertirary dreams...

When I was playing with the idea of "strands of thought", that's how I was thinking of things. It leads to interesting questions as to the importance of the primary strand. It's not strictly necessary that there is one strand which is more stable, bright, 3D-immersive than others - I can see no need for stability in and of itself, prior to its formation, since stability is required in order to have the ability to reflect upon how nice it is to be stable. However, it's probably inevitable that one will arise eventually and become the effective default to which other strands collapse, until that primary strand itself collapses. Following the collapse of the current apparently primary strand, I suppose either another strand will be revealed, or another strand will simply unfold from the logical fragments of the collapsed strand. "Experiencing" will always continue, being as it is the "container" for all strands of experience. The question really is: at the moment the strand collapses, are you identified with part of the content of the strand which is dissolving, and therefore you continue in ignorance of your prior experience? Or have you become identified with the "container" or the nature of experiencing itself, and therefore can knowingly continue, since your stability is now (almost) independent of content?

(Obviously, "strands" and "dreams" are concepts we are using. We infer they exist for our little model, but I'd suggest that the actual experience is simply one of ongoing content with no true hierarchy. The structure of experience needn't necessarily support a time-and-continuity framework at all.)

...

The experience-of-something is a real experience, but the "something" is not real beyond the experience of it. In the sense that there is nothing "behind" the content of an experience. Sand horses aren't made from "horse" [<https://www.youtube.com/watch?v=SxtyM9mFMQQ>], typa deal.

I was just think about you today. Where is TG I was thinking? I mean I know you're "out there." As for your comment, of course I agree 100% with that one.

Yeah, I've been keeping an eye on things, but not had much to say that wouldn't be just interjecting for the sake of it. Not that this usually stops me, mind you! :-)

POST: You are constantly shifting dimensions already

Let's not become yet another sub where people just post "shit they found"! (I know you have the best intentions, so this isn't meant to be against you. It's a more general response.) I was originally going to set up an AutoModerator rule as has been done elsewhere, which bounces posts which are just links or which have no additional input or perspective from the poster. But we generally don't get a lot of it anyway (maybe due to the guidelines or because people feel that it's not appropriate).

Bashar is interesting, but links to his stuff appears on every "non-standard" subreddit, and there's not much value in it unless you say how exactly it ties in with the subreddit. It's just spam otherwise. See for instance: a previous time a Bashar link was posted. It doesn't necessarily take much more than that (although more would be encouraged now, I'd say). For instance, do you agree that we are "constantly shifting dimensions already"? Do you think it's a useful concept? If so, tell us why and start a discussion. Have you actually used this perspective and got results which have been beneficial or interesting? (Personally I think it really muddles up a couple of different ideas, and actually makes it harder to conceive of how to make a deliberate change in your experience.)

You get the idea.

Muddle up in what way? Could you expand?

It effectively designates each "sensory frame" of experience as a "dimension" - which isn't very helpful. It is better, I would say, to designate a "dimension" as being a particular distribution of facts - or state - which implies a particular set of experiential moments, as a deterministic path. That way can reserve the concept of "shifting dimensions" as being for an intentional change of the underlying facts or state, which effectively defines a new deterministic experiential path "as if" we were in a different dimension. (In actual fact, we never go anywhere, of course. We just have different content arise in our open awareness.)

Things like surrender, allowing, faith and intention all make more sense under this model - and it ties in nicely to the observable nature of our direct experience too, and how it relates to intending (which is the only thing which ever happens). With this, rather than being only a sort of abstract concept with "frequencies" as the bridge, "dimensions" become more clearly about the patterning of experience itself/ourself. In the end though, all of this stuff is metaphorical. We have experiences "as if" it were true, just as we tend to have experiences "as if" the world were a "spatially-extended place unfolding in time", rather than more of an "infinite gloop" with us the experiencing container. So we should all feel free to pick the descriptions that we find most attractive - just so long as we remember that this doesn't correspond to "how it is really, behind the scenes" (because there is no "behind the scenes"), and that sensory content has no causal power.

You're already constantly shifting dimensions = you're already constantly fiddling with your felt sense of the world via intent.

Although you shouldn't be, I suggest?

That's one of the aims to have, I'd say: to not be constantly thrashing your world around via reactive intention to the current sensory experience. Otherwise you are doomed to spend your life trying to "maintain a vibrational state", and so on. As for "dimensions", I feel that defining the term so broadly makes it essentially meaningless, since it means you are never "in" a dimension at all, again encouraging that "fiddling and forever maintenance" mindset.

But...

I'm of the "whatever works for you is good" view overall. The problem I have with Bashar (despite all the ET stuff which is fun but distracting) is that it doesn't really go anywhere in terms of leading to methods (or non-methods), or to realising the nature of your experience and so being able to build out from that. Now of course, the Bashar audience is not really the philosophical or metaphysical audience, nor is it the "post-magickal" or nondual audience, so it's a different perspective. For me, it kinda just adds another separate strand to the New Age / LOA realityshifting catalogue, rather than consolidating it into a useful worldview that connects to direct experience.

Every second you shift to a completely new and different objective dimension.

I'm not so sure where "objective" comes into this?

I feel the Bashar, although interesting in his thoughts, doesn't give any practices that might help people start thinking the way his teachings propagate. Correct me if I have missed any such practices.

He also doesn't tell you what a state is. Most importantly though, as far as I know he doesn't connect his concepts to your ongoing direct experience. Without that bridge, there's effectively no descriptive model (even one that recognises itself as metaphor), and so he can offer no practical approach other than vague notions of "frequencies" or "tuning in".

(When we say "practical", that doesn't necessarily mean actions - because actions are "before" experience in this case, since the root of it all is intention, and nobody can tell you how to intend. However, that itself is something that needs to be covered when talking about "dimensions" or whatever other scheme we're using.)

Q1: Maybe that is why most religions dissuade channelling? Because these other species can't fathom human limitations?
When Bashar talks, I feel like he's irritated at some of the "silly questions" that people ask, as if they should know such "basic things".
BTW, I have yet to understand what the importance or application of "metaphor" is in Oneirosophy.

I suppose that rather depends on what you think "other species" are, and what "you" are, and so on. But I think that organised religions (as distinct from the originators of the ideas that seeded them) dissuade channeling because it makes you your own authority. After messing about with such things, you are in danger of discovering that it is you who are, in effect, God - albeit a different sort of "God" than the one usually taught in church. On metaphors: It is my view that by deliberately adopting a metaphor (or a conceptual structure more generally) you can reformat or "pattern" your state such that your subsequent experiences arise "as if" it were true. Furthermore, there is no sold underlying substrate to our experience other than such patterns. (Of course, the idea of "patterning" is itself such a metaphor.)

Q1: So basically metaphors make it easy for us to believe or intend, right? So, that's what is contained in more religious and occult practices.
Furthermore, there is no sold underlying substrate to our experience other than such patterns.
Could you explain that in simpler language? LOL

Ha, sorry. So, the idea is that there is no fixed world from which your experience arises. Looking around the room you are in now, for example, you see walls and the screen you are reading this on, and hands interacting with the device (all assuming things are well). Generally, we assume there is a fixed and solid world "outside" that is feeding us this sensory experience. That would be the "solid substrate". However, we never experience such an outside world. We only ever experience... experiencing. And all of your experiences, although they might seem to be "about" objects and rooms and so on, they are made from this "experiencing", and everything arises in "mind". This is no solid world behind your experiences. What you have, in other words, are habitual patterns with nothing underneath them. The way to confirm this, of course, is to try to change that "patterning" and see if your experiences change accordingly - perhaps indirectly at first, such as repeatedly bringing about outcomes that you want, to the extent that it cannot be explained away by coincidence or confirmation bias.

Related: Three Dialogues by George Berkeley is one of the swiftest ways to get an overview of this idea. (He mentions 'God' later, but just replace that when reading with something like 'mind' or 'consciousness'.)

POST: Choosing not to exist

If consciousness became completely uniform there would be no "experience" but there would be "being". You probably can't say that this "exists" because there is no state or form, but it... is. Can you ever get to that stage? Not by intention I'd say, because intention is always formulated positively. You dispose of something by shifting to a different state - a replacement pattern or even a pattern of "empty space" - but that's just a change of the form of existence. But perhaps by detachment and allowing it to fade...

But that "zero potential" would not persist. It would be outside of time and so it would in a sense last "forever" but also "eventually" there would be the adoption of form and experience would begin again. The previous "mind" (by which I mean accumulated patterns) would be gone, and a new one would arise in its place. This has probably happened an infinite number of times already.

Short answer: temporarily and **no**.

Sorry, I've just been editing that response to make the hypothetical aspect clearer. I'm still not happy with it. The problem is that we can't describe in language something that is before time and space. Usually I leave this as "nothing can be said" since we can only talk in terms of "human formatting". And I think that is probably the basis of the answer: You can never conceive of non-existence and so you can never intend it; which means that you have always intended a continuance of experience, and so it will continue "forever". Maybe another approach is better: When we go to sleep at night and enter a dream, why do we return to this world? Is it simply because we have held onto the context of it? Could we enter a dream world and then decide to "let go" of this world, remaining in the dream?

Going forward from that, could we intend a contentless dream? These are fairly common, but there still persists a subtle "viewpoint" and by its very existence all logical possibilities are effectively persistent, dissolved into the background and possible to activate. The mere existence of that viewpoint implies all possible worlds.

TriumphantGeorge Compendium - Part 16

POST: Hindu Mythology Metaphor

[Reposting my reply from elsewhere, for completeness.]

Can a Mantra be a Metaphor?

Good question! Some thoughts: If we abstract these terms out into "patterns" then, effectively yes. To say a word is to trigger its associated patterns. Meanwhile, a metaphor is simply a named set of overlapping relationships (patterns), connected and associated with an unnamed set of overlapping relationships (patterns). To say the word "owl" is to trigger the associated patterns of "birds", "wings", "big eyes", "tree branches", "Blade Runner Voight-Kampff Test", "Rachael", "night-time", etc. To think-about an owl is to do the same.

On archetypes

Gods and Goddesses, owls and archetypes, they are all just triggers for pre-existing extended patterns which cannot be encapsulated in a word or an image, but can be triggered or intensified by them. All possible patterns are here, now, in your experience - it's just that some are more intensely activated than others. To feel better (simplistically speaking) you want to allow the "bad feeling" to fade and a "good feeling" to become more intense. How to do? "Detach" from your current experience and "allow" it to shift; trigger a pattern which implies the desired state. Literally, you are a wide-open perceptual space with some experiential patterns more intense than others. You don't "heal" so much as "allow experience to apparently shift". More accurately: you can't change anything, you can only let the present pattern dim and intensify an alternative pattern by "recalling" it.

...

Hmm, as you have uncovered more "knowledge", do you think your approach to living has shifted?

I guess I'm suggesting: is your attempt to deliberately apply metaphysics effortfully as a manipulative tool maybe presenting a barrier to your success with it, whereas before you were more flowing your life via intention from within it? I think where we go wrong is that we try to work things out, we get hung up on technique, but the truth is... there is no mechanism. Simply deciding is all that is required. To decide something is to have the pattern of "something" in mind plus the pattern of "it happening". That is sufficient, provided you do not then block it. Everything else is just... stirring the water, splashing about, obscuring things, fragmenting ourselves and therefore our experience. Actually, there is nothing to know, no structure behind things, no solid substrate supporting the world beyond imagination.

Forget mantras for that maybe, you need to take a different approach. Check out the top two posts in this subreddit. Basically, you want to lie down one day... and never get up. Switch to being the background space. Only experience "getting up happening". I really recommend this book by Missy Vineyard for this. Specifically the middle section where she experiments with waiting for movement to happen by itself. That is what you are shooting for.

Extra bit: Mantras are only needed because we don't understand willing and so need a "second cause" to allow ourselves to make a change. But all change is just will, changing the shape of ourselves by... changing the shape of ourselves.

POST: PSA: Be careful when thinking about "I"

Yes, it's a language trickiness. It's sort of awkward to constantly distinguish between "Is" and "selfs", but unless you flag up the difference it is easy for a reader to become confused, thinking you are talking about a person being "God". There is no ego-self other than the experiencing of various thoughts, perceptions, actions and the subsequent thinking-about them. And the experiencer is "the open aware space" - which you might call God - who takes on the shape of experiences. As always, when we start thinking-about things we are immediately wrong and operating in 3rd-person metaphor (although of course that can be very useful). The difference between "i" and "I" is direct 1st-person (no-"person") experiencing.

I didn't know that what I needed to do was not think and just let things be.

Yeah, that's a big hurdle. I used to use the phrase "stop generating" to describe it (Although at first I would just think it a lot or try to do "stopping", which rather missed the point of my insight, eh.)

Realising that your default should be "allowing" with only occasional pattern creation-amendment is an important step.

What do you do now if things start getting out of hand?

If you haven't read the Overwriting Yourself post, check it out. The 'passive' version of the exercise is a nice easy way of letting things settle. Following that, decide not to 'force' anything, including your bodily movements and thoughts. Try and let them "arise by themselves". This stops things building up; lets them subside naturally.

What do you mean by pattern creation-ammendment?

Just setting something going by decision and imagination. Once you've set things in motion, you should leave them be (e.g. you request success in an endeavour, the pattern is now set, so don't tinker with it). You're only dealing in updates as required, or a regular keeping-on-track.

Otherwise I'm horribly depressed.

Yeah. I do find that if I don't stay 'present' - allow my focus to remain expanded out into the space of experience - my attention gets narrowed and I feel depression. Having things 'on the go' does tend to keep you opened out more.

I like your Overwriting Yourself post. I've tried something similar to this where I just imagine that my body is empty space but haven't played with it much. Your post clarified quite a bit. How experiential has all of this become for you? Is it all incredibly obvious at this point?

It changes your perspective to being far simpler. The most important thing is that it clarifies the difference between direct-experiencing and thinking-about, and you can more obviously take the perspective of the space in which both occur.

...

The mistake in contemplation is that you can't contemplate the "I". It is the environment in which contemplation arises; it can't be conceptualised or even pointed to. The urge is so great to "grab ahold of it" somehow. It's probably something that never entirely goes away, because it's inevitable to want to think and talk about it - in subreddits just like this...

I think it would be useful at some point to do some coverage about direct-experiencing and the difference between that and thinking-about. Various metaphors imply it, but I don't think we've explored it explicitly in any post. Which is unfortunate, since detached-allowing and knowing the difference between the two types of experiencing (really the one type, improperly understood) is fundamental.

POST: The Mirror-like Nature of the Mind & Why I've come to the conclusion that Oneirosophy isn't a good strategy

The basic strategy of some on this sub seems to be "well if I believe in my own power enough, then my unconventional perceptions are true"

Hopefully not, but perhaps you are right. However that's like thinking you can simply will things to happen or by "doing" things. But it's not quite like that. And more like you say. Like I said in an earlier post, it's more like triggering patterns (or "letting experiences through") which then arise in and shape subsequent experience:

- Experiences leave traces which in-form subsequent experiences. (Leave shapes on your "experiential filter".)
- Thoughts also leave traces, as in-form-ation, affecting subsequent experiences. (You can use this deliberately.)
- Synchronicity is the name for the experiential patterns which result.

This is the reason you should treat the subjective environment (as it were) as being almost mechanical and unintelligent in nature. Only you are the intelligence. You are basically you experiencing the state of your own mind, via the senses. Yes, you might think of it a bit like a mirror - or better, that your mind is a perceptual filter. So, not much good for "messages" since you'll just be seeing what you've been thinking and experiencing, as residual indentations on your filter - except that you might get some insight into things you are thinking in the background that you're not aware of. If you spend 20 minutes today imagining owls, as vividly as you can, as if they were in the room with you... you'll spend the next week encountering lots of owls. It's as if you have created an "owl-shaped hole" in your perceptual filter, and the "infinite light of creation" (or whatever) now shines through it, giving you owl-shaped experiences.

If you believed in a deeper meaning to what you were experiencing, you might think you were getting Messages From The Eternal Owls, who were answering your questions and prayers now that you had gained power over them. If you spent time imagining being King Of The Monkeys instead, you might get experiences which you would interpret in line with that. This itself is incredibly useful - and you can live exciting storylines! - but you have to be careful not to believe the thoughts and experiences which appear in your awareness. They have no deeper meaning than being-experiences. Which is great, because you can now understand what happens when you get paranoid, and what happens when you get arrogant. You can put that aside, breathe, and let things settle out into a more authentic pattern.

Never believe what you are experiencing. They are just... experiences.

EDIT: Surely this is exactly what Oneirosophy leads to? It's the natural conclusion to living life as a subjective environment? It's what lucidity reveals to you. Subjective idealism means there is no you, just that environment, and it makes sense then that it operates and responds as a swirling, responsive dream-space.

It's not even "as if" you've created an owl-shaped hole.

I say "as if" because the metaphor of the filter and the hole is that, a metaphor. Saying "as if" doesn't mean the experience is less valid, it just indicates the description of it is arbitrary. You are not really making dents in a filter; that's just a way of looking at it for the purposes of formulating intentions.

There's no harm in learning to exercise this. In fact, it ought to be encouraged.

Are you responding to the wrong person here??

I guess I don't entirely understand OP's distinction between "being-experiences" and "believing in" them.

As I understand it - and this may be me overlaying my own interpretation - OP's underlying point is that if you are unaware of the reflection-like, "as if"-ness mechanism involved in subjective idealism, then you can fall under the impression that you have become something, created something, or are in some sort of state. However, it really is just an appearance. There is nothing "behind" your experiences, therefore nothing to believe you are and nothing to believe you have done. This is of course much more powerful than believing you are God or anything else. Believing you are something comes with restrictions; recognising it's an "as if" experience doesn't. Language, for sure, but forums throughout reddit are swamped with people wondering what they "are", claiming to be this and that, and generally taking sensory experience and history recall as causal fact.

You can't live exciting storylines without believing your perceptions. Otherwise it's just some superficial fantasy.

I'm not sure I quite agree on the latter sentence. I'd say that if you understand the process then you aren't having a superficial fantasy; you are simply enjoying experiences. But your point of identifying with a psychological narrative - be it "infinite power" or anything else - is well made. So, the Owl Generation Process is completely mechanical. "Ponder them and they will come." The exception is if you obstruct the process by disbelief. Which you might then be tempted to overcome with belief - and that's where things go wrong. You can get caught up the the believing process you (think) you used to generate the effect.

If you recognise the process for what it is though, you can enjoy the Owl Experiences and without any additional troublesome beliefs. It's up to you if you want to fully commit to "An Important Mission Personally Given To Your By The High Owl Commander". (Personally I wouldn't - he's a right grumpy bastard.)

You can't actually be angry and see the empty nature of your perception at the same time.

If you aren't "in" the story then you can't really be having the adventure. Although I think you can dip in and out, personally. All I'd argue for is that people understand the nature of the process, and thereby have the ability to make choices. You don't have to use belief as a tool (as in with many magickal approaches) and then get stuck in it, if you've observed the mechanical-like nature of the process and approach things from that perspective.

Personally, I dont try to stay fixed in one worldview, so I dont have a problem with these inconsistencies.

Hi, I make the point elsewhere that there are no true divisions, it's a matter of where you "stand". What you say is true.

An analogy I sometimes use is the superposition of patterns: combine 100 patterns together and you've still got... a pattern. Which can then be broken down into a completely different set of patterns. Depending on what you want to accomplish or which aspects you want to highlight, you might emphasise the perspective of one "component" or another. But really, there is no separation. For basic "daily navigation" and accounting for deliberate synchronicity, this formulation (filtering infinity) is quite convenient. But it is nothing more than an "active metaphor".

Implicit in all discussions here is "it's nondual", I'd say, but there's nothing else to say if we just sit there with that! It's like saying "all is consciousness". As you point out, there is no answer.

"There are no answers, only choices", as Gibarian says in Solaris.

POST: Controlling vs flowing

[POST]

I think one area I was getting hung up until very recently was taking the idea of control and trying to apply it to every instant. This was making life unnecessarily stressful as I tried to intend something out of every perceived event. It was like I tried to rewrite the story as soon as something that didn't seem to fit was going on. If you're currently doing this I suggest you take a breather. There's really no need to control every little aspect of life and honestly it's a drag. If you're always writing the story you can't properly enjoy it as well. Control works simply, you intend for an experience to occur and it does. That simple, no added effort necessary. Then after it's set all you have to do is be detached and let it all happen (the hardest part if you're still attached to the idea of the limited person). So ideally, one can control the types of forms one comes into contact with, and then let go indefinitely for it to play out. You can be as specific as you want, but if you don't let go, you'll never get to experience it. You simply keep rewriting things over and over and over. The better you get at letting go, the faster your manifestations.

[END OF POST]

Good stuff. Right. For sure!

So you only need to intervene now and again, which just amounts to "deciding and allowing". Mostly you should simply be relaxed and enjoying the experience unfolding. For sure, sometimes it's fun to have little tools or visualisations for things, perhaps to make it easier to specify what we want, or to "outsource" the causality and circumvent resistance - e.g. as you suggest, by imagining releasing negativity via the breath or whatever - but it's always just us "deciding". Focused "control" is when you obsessively interfere; detached "directing" is when you occasionally intervene when you want to have a different experience. The more you let go of control and stop holding back the flow, the less the apparent time between the decision and its appearance in the senses, because you are no longer restricting the potential routes by which experience can arise. Holding back is essentially you preventing yourself relaxing into your natural authentic pattern. You default state should be relaxed openness and "allowing". That's what meditation should be for - allowing releasing. (Any experiences you might have are just yet more experiences, best just to sit a while and let things settle out). Just sit for a while and re-identify as the background awareness as in the original "Just Decide" exercise.

In the ultimate version, you don't really need to interfere at all because you are completely authentic and experience is always in line with your desires, the right events at the time time.

Summary of how it works?

- Deciding what will happen means you are triggering a 1st person perspective memory-pattern of that happening.
- If you were completely detached, that pattern would immediately become your experience.
- Because you are not, the pattern will instead blend with other patterns you are attached to, showing itself as first as synchronicity and eventually as a result that seems to arrive via a path.

EDIT: This prompted me to post my bullet-point summary of the memory-pattern view.

POST: Opinions on the use of Psychedelics/Dissociatives

Your final quote is interesting, it reads a little like the metaphor I posted the other day. Although I don't agree that there are spirits, etc, that are independent of us. Nor do I agree we're on some sort of learning journey. Maybe we were having pretend-games life-fun, but somehow we've forgotten we are always using ultimate power to do anything. Our experience is awash with synchronicity as a result. They seem mystifying to us, or somehow "important", because we don't realise we are splashing around in the puddle of our own existence, then interpreting the ripples as coming from elsewhere. We therefore have to be careful about interpreting anything as being "intended for something" or having external meaning. Even lifting our arms is a result of prayer (sorta) which just activates an ingrained habit, a sort of extended spatio-temporal memory that plays forward into experience. Moving your arm and encountering a synchronicity are the same thing, with as much meaning as the seed intention lends it. I've never dabbled in the psychedelics though, so always interested in people's experiences - since it definitely appears to be another way to allow yourself to let normally-filtered experiences in. Dissolve the filter substantially (belief, expectation, knowledge) and the raw creative aspect gets to shine through more (mediated by intention, perhaps, if you persist it).

[Limitation and Freedom] Why isn't one of those great experiences enough to be free forever?

Because it's just an experience; it doesn't have any "causal effect" on its own, except what you lend to it. Experiences don't change us in and of themselves, they just suggest a world of possibility. If we don't start intending from that new sense of freedom, it'll make no difference. As far as Mind is concerned, there are no bad habits or good habits. Any intention you have will result in a result, but more importantly: all the associations implied by the thought will appear also. That's why if you, say, pretend to be "Hercules" for his power, you would also find you had mood swings and trouble with your parents. Loosely, if you act "as if" something, you get all the implied benefits and downsides from being that something. It's this associative quality that can get us lost. We've already got stacks and stacks of patterns that are triggered by touching the edge of any one of them. That's what limits the voluntariness or complete control (and rightly so). If you think or do something that implies the existence of spirits, then your experience will accommodate accordingly. That's why it's hard to pin all this down into one coherent view - e.g. explaining why "commanding" something can work. The answer there: Saying the words implies and is part of an associative pattern linked to the resulting experience, when done with intention and confidence. You aren't doing commanding, you are bringing part of a pattern into mind and - like a memory - it is auto-completing across time, with you experiencing the results subsequently.

[Freemason's Adventure] So that was kinda neat.

Yeah, I mean, it can be really good fun. It just makes it so obviously dream-like! It then becomes very important to realise what synchronicity is though - because you can't be tempted to believe that your experiences and thoughts are true in some fundamental way. If you are interested in conspiracies (for example), you start seeing them everywhere. And it's not just imagined: people will look over at you more, your mail will seem to have been opened. And if you start fighting the conspiracy, it will just get deeper!

So that view on synchronicity is a good reminder to keep clear on the things you'd like to experience, and to take the present sensory world with a pinch of salt.

POST: Front/back of the mind, absence vs presence, "something what it's like of itself."

These are good areas to explore. Particularly how we literalise expressions by locating our thoughts or experiences, or our sense of "where we are" relative to other parts of the ongoing experience. In my effort to come up with metaphors which encourage us to "be all of our moment", here's my most recent. Again we are confronted with the reluctance to release holding onto particular sensations and regions ("the body" area and its sensory content) and how difficult it can be to give up on that. I don't think there's any way around that except, well, "absolute allowing" one day.

The Imagination Room

There is a vast room. The floor is transparent, and through it an infinitely bright light shines, completely filling the room with unchanging, unbounded white light. Suddenly, patterns start to appear on the floor. These patterns filter the light. The patterns accumulate, layer upon layer intertwined, until instead of homogenous light filling the room, the light seems to be holographically redirected by the patterns into the shape of experiences, arranged in space, unfolding over time. Experiences which consist of sensations, perceptions and thoughts. At the centre of the room there are bodily sensations, which you recognise as... you, your body. You decide to centre yourself in the upper part of that region, as if you were "looking out from" there, "being" that bodily experience. At the moment you are simply experiencing, not doing anything. However you notice that every experience that arises slightly deepens the pattern corresponding to it, making it more stable, and more likely to appear again as the light is funnelled into that shape. Now, you notice something else. If you create a thought, then the image will appear floating in the room - as an experience. Again, the corresponding pattern is deepened. Only this time, you are creating the experience and in effect creating a new habit in your world!

Even saying a word or a phrase triggers the corresponding associations, so it is not just the simple thought that leaves a deeper pattern, but the whole context of that thought, its history and relationships. Now, as you walk around today, you will feel the ground beneath your feet - but you will know that under what appears to be the ground is actually the floor of the room, through which the light is shining, being shaped into the experience around you. And every thought or experience you have is shifting the pattern...

...

Then I consider my vision....

Something to investigate here is whether you are trying to see, which reinforces vision as: a) a sense and, b) related to the eyes. Maybe see what approaching the world as non-sense-based, but perception or object based does. Instead of subtly seeking out experience, "let the world come to you". Sit back a little in your head, or identify with the background space, and let the images arise by themselves. I played a lot with vision exercises back in the day (Bates Method and so on) but in the end I figured they were all about learning to not hold onto your body and senses, and often relocate your sense of self to be less narrowed. The exercises were just a way of teaching yourself that things can happen by themselves.

It's funny how your permission is needed before things can happen "by themselves." ;)

Ha - words! But it's true. :-)

I'm not sure I understand what you're saying here. I'm trying to see the difference between sense and perception. I'm giving permission, yet it does not arise

Sorry, it's hard to describe!

I'm saying that, we never really experience sensations on their own, we experience objects. For instance - when I see a ball, I don't see a circle filled with colour except for a darker crescent at once side, or even a sphere with colour - I see a ball. The more we "grasp" with our eyes, the more we narrow our experience down to attempted seeing, with the restriction of the concept of eyes. When we sit back, we let the "world-building" aspect of ourselves create our surroundings spontaneously. To get a feel (literally) for this, sit in front of a table and close your eyes. Stay open and relaxed. Now, touch the corner of the table. Now, touch an edge of the table. Now, touch the other corner of the table. You'll find that you have a full "feel-picture" of the table even though you are not touching the whole table simultaneously - and you did not consciously build or maintain that feel-picture. If you focus on the sensations one by one, you limit this process. Seeing works in the same way. Your eyes dart about the place, "touching" different parts of the visual experience, and a world is built and updated and given to you. You are not mean to pay attention to this, control your eyes directly, or even be aware of your eyes. To do so at all deforms perception. I'd say that any narrowing of attention limits the spontaneity of "world appearance". You end up concentrating on a particular sensation, while inhibiting the big picture object-based experience. Let's try another way to describe this. What you are really after is to get "eyes" out of the picture altogether. The more you adopt the seeing-with-eyes and making-seeing-happen concepts, the more they will deform your experience. (Just like when you try to experience or control yourself doing something as you do it; it kills the natural flow.)

The quick way to do this is to check where you are "looking out from" and whether you are trying to force your world-experience. Experiment with locating your centre in different positions. See Seeing from the Core for a kinda summary.

What has your experience been with this technique?

When you think about it, it has to be simple!

It starts with just the world feeling more "open and there" and then you suddenly notice every now and again that things are "in focus" and it builds from that. Still catch myself trying now and again, usually after working on something, but then I "sit back" and it gets better. Big aim is to bring that attitude to everything!

Strange thing is, I realised I don't really navigate the world all that much by vision really; it's about "spatial feel". Don't know if that's the same for everyone else.

EDIT: The "let the world come to you" phrase is the one that I use to remind me of all this.

POST: Absolute Power

***cosmicprankster420:** oneirosophy is all about achieving lucidity, that's it, the rest is up to you in terms of what you want to do with your dream. There are lots of different methods to achieve it as well, but once you get it you cant deny it. While i too don't want to be a tyrant in my dream, their is an importance to having a willpower strong enough that you don't get overwhelmed by your own creation. But its also important to understand that figuring this is a dream is only the beginning. Beyond the surface level, there are many habits and beliefs in which we don't look at through lucid eyes. When i first created this sub i didn't realize some of the directions the other members would take it, but its been interesting none the less and i like hearing other peoples perspectives on this process even if i don't always agree with them. But some aspect of authority is important because this is YOUR dream, not mine, not anyone else's, but yours. While you don't have to be a tyrant, you want to be powerful enough so that your dream characters don't become tyrannical over your dream and have them call the shots to the point that you feel weak and helpless.*

As /u/cosmicprankster420 says, it's about knowingly being what you already are. Any tweaks or exploration you do after that is completely optional. And: You don't need to waste time being frightened of things.

I am detached, but thoroughly enjoying where this story takes me.

Which is a privilege of the lucid, don't you think? How you explore the dream afterwards, that's a "personal" decision. You are of course constantly using your God-like powers, via creation by implication. By knowing this, you save yourself polluting your dream with unpleasant, unintended nonsense. I think that's the main benefit of the Oneirosophic approach.

POST: God is male; The Universe is female; The Self is the meeting of the two

I found a simpler way of saying what I was saying. A Universe without a God doesn't exist; but a God without a Universe doesn't exist either.

Or: God cannot experience his existence without a universe, by shaping himself as a universe.

Sure, that works too. But the male female dynamic seems to be necessary on some level. The goal seems to be to unify the two, but they need to each have their own sentence.

I guess: the world-as-metaphor - the whole of experience seems to be a play on opposites and reunification.

POST: But where did it all come from?

Patterns upon patterns upon patterns, dissolved into awareness? Raw potentiality/creativity, filtered/shaped through accumulated patterns, resulting in (equating to) sensory experience. All experience is therefore conceptual, archetypal. Also:

- Experiences leave traces which in-form subsequent experiences.
- Thinking is an experience which leaves traces similarly...

Where did these structures come from? Something akin to the way hypnagogic imagery turns into dream environments. There was an infinite amount of time for this to happen, of course. All you need is randomness plus slight inertia.

TL;DR: **We are dreaming.**

As there is no solid substrate behind the scenes, we can dream anything - including being confused, or experiencing an 'illusion', or dissolving into non-dual awareness, or uncovering the Super-Real Truth Behind It All, which includes maybe even identifying a solid substrate behind the scenes...

But all of those are just more experiences; there is no real truth to be discovered, except to realise the arbitrariness of it. That is why seekers keep on seeking: because they have chosen to be seekers, by self-imagining or by it being implied in their actions. Freedom fighters have to fight for their freedom, by definition. The dream always arises "as if" your approach or assumptions are true, and any metaphors you adopt will reformat the world according to your new "understanding". If you instead simply rest a while, stop pushing and prodding, the dream settles somewhat, and things become clearer, the apparent environment's responsiveness more obvious. **You can't not-dream** - so it's a case of **choosing to have sweet dreams**.

POST: How do you solve a problem like feedback loops?

All that would lead me to believe that it's in my best interests to find ways to 'collapse' the feedback loops around me - but I wonder if there's not a more direct way? Is it possible to instead reduce our dependence on feedback loops?

Hmm. Yes, I'd say. Because the feedback loop is a sign of you resisting learning by trying to control the process. When you learned your first language as a child, did you use a feedback loop? Was it "pretty tough"? I don't think there was a force of will involved there. Learning and problem-solving are just what the mind does, naturally, as part of its "structure" - unless you are holding onto your pre-existing patterns and preventing them modifying (or only letting them be modified in a controlled, limited manner - deliberately and consciously by "you"). The urge to manage and 'be aware' of things happening is a restriction that prevents progress in any endeavour. Perhaps all that is required to become, say, a musical prodigy is to give yourself a metaphorical bang on the head.

In any case, we're getting away from the point, which is not language learning!

No, but it's a good example of limited change in adults compared with spontaneous, effortless development in children. And one of the reasons adults have such a hard time is because they start thinking in terms of concepts like "impetus", "model" and "feedback loops" and approach things as if their ideas of how something works is how it really works underneath. Which is at the root of many problems people have with manifestation generally...

If I could 'contort my tactile sense field' in such a way to get instantaneous feedback, finding which contortions work and which do not would be drastically faster.

Why do you need the feedback? Can't you just ask for the end result and have it? Feedback is just an experience. If you are getting the experience of feedback, that's part of what you have intended...

But more often than not, my intentions do not manifest immediately - so maybe what I'm asking is this: how to better connect intention and manifestation?

I'd say that intention and manifestation are identical and that you are getting exactly what you are asking for. Manifestation is always instantaneous!

If I intend something to happen next month, it is true right now that it happens next month. The manifestation occurs immediately from the perspective of the timeless landscape of the world. Following the intention, your ongoing present moment then has the experiences as they are laid out. So if you intend something and you go through a cycle of feedback before you get the final result, maybe that's because you intended that whole process - by implication, through your expectation about how the world works. The structure of your mind dictated the pattern that your manifestation would take. To get more "direct" then, perhaps one must dispense with any notions of "the mechanism".

TL;DR: **You need to intend to "skip to the end!"**

POST: We talk a lot about getting away from the consensus on this sub, lets talk about methods of escape.

AI: mostly from no longer believing that what goes on in my imagination is fake and whats out there as being real
This type of observation is key. In order to undermine convention really thoroughly I need to become aware of my most subtle trends and the tacit, silent, unspoken reasons that underpin those trends. Another one from this series is the idea that there are objects that can bump into each other and displace each other, that compete with each other for space, etc. Another subtle idea is that whatever appears visually is more indicative of an outer world, and whatever appears to touch (body sense) is more indicative of an inner world. Example: I am itching (tactile sense disturbed), but I see no bug and no red area on the skin (visual sense is not in line with the tactile). I think, "ah, it's just in my mind." Then! I see a bug and a red spot (visual sense is disturbed), but I am not at all itching (tactile sense is peaceful). Then I think "Oh, I really got bitten just now, even though I don't feel the itch." So when the sense fields fall out of harmony, it's obvious that they don't all take on the same import in the mind as to what they may signify. The fact that I am aware of this is incredibly useful in breaking down convention. I am seeing how ridiculous it is to use one sense to mean that and another sense to mean this (this and that, that and this). It's totally arbitrary. Nothing is forcing me to think this way. And so on. There are more ideas/insights like this. They are very very subtle and they're generally very hard to notice, but noticing them detonates the convention much more than any kind of repetitive exercise. I don't think we can exercise our way to a sense of absurdity, and it's exactly this sense of absurdity that undermines convention. Still, exercise is incredibly useful as it often (if not always) serves as a fertile ground for contemplation which can then generate an appropriate sense of absurdity. So I am not really poo-pooing exercise as much as I am trying to put things in a perspective that I myself find very powerful in my own life. Of course what happens next is exactly as you describe, because once you for example stop thinking that imagination is fake and non-imagination (whatever the heck it is) is real, it alters how you live your life. So when you do find your manner of living grossly or subtly altered, that's a good sign that you've probably hit upon an authentic change of mind.

Good point. The whole identification of certain senses with your "spatial perimeter", combined with the assumption that events occurring within a certain timeframe after an intention defines your "temporal perimeter", is a powerful illusion. From elsewhere: It's great talking about the illusion of space and being connected, but unless I can look around and see it to be true then what's the use?

So I think we always need to start with our actual experience, and there are two aspects of it which are probably key:

- How do I come to mark out one area of my present moment experience as "me" and the rest of it as "not-me"?
- How do I actually create movements and thoughts - if indeed I can detect myself doing so?

And my answers are: That it seems pretty arbitrary how I divide up the world (I think of it as being divided but it isn't really when I look), and that I seem to just "want it" and a bit later the experience happens (so I just assume my limitations are based on sensation and distance and time). So I don't know about connected, but things definitely don't seem to be divided.

but the first "step" is instant

Yes. This is where our common mistake comes from. Our intention is a reshaping of the universe. Just because we don't encounter the experience until later, we think either we didn't cause it, or that our 'prayers were answered' by some more circuitous route. Similar to our conversation a while ago about inserting facts into the future. It is true now that I will find the bookstore "later".

We maintain a narrative that describes a causal domain. A narrative as I mean it is more than just verbiage.

Yes. It's basically part of the assumed belief- or habit-structure of our world that dictates the form of our experience.

Also from elsewhere:

(Random bits of comments I keep meaning to gather together. Excuse the spatial/level metaphors, obviously they are not actual.)

The room around you is just a floating image. Its true source is deep down, enfolded. We confuse our sensory experience for being "the entire reality" but in fact all the good stuff happens elsewhere. Perhaps we might envisage it as: All intentions, even if apparently directed at the immediate surroundings, actually insert themselves at the lowest level of reality, undivided, and then bubble up everywhere. Even if you just decide to reach out and pick up your cup of coffee, that decision actually goes "the long way round". The intention creates a ripple at the very fundamental level, which then shifts the universe, which is then experienced "locally" as an image and sensation of your arm moving and a cup being held. And because every intention inserts itself at the seed of the whole universe, you lifting a cup actually affects the whole of reality to a slight degree. If instead you had furiously smashed the cup on the ground, that violent intention might have shifted the whole universe slightly towards aggression: a painting in a gallery in Dusseldorf falls from the wall; a disagreement between two men in a bar in Iceland escalates into a punching match; a clear sky in Australia darkens and a storm begins.

It's deeper in the mind, more toward the sub- and un-conscious regions of our own mind right here. Of course I do realize that you know it.

Yeah. There really is no way to escape from spatial metaphors, eh! The "elsewhere" is enfolded into the "apparent here", it's all here - etc. One of the things I've been doing lately is deliberately 'being the space' and having present moment experience obviously floating within it, while maintaining the felt-sense of everything being in that space.

Donald Hoffman

Ah yes, I liked that talk. I came across his paper on Conscious Realism and Interface Theory a while back and found it quite capturing. There's also a really nice short video with him chatting to a former colleague about switching to this stuff once he'd secured tenure, attitudes toward this sort of thinking, etc, but I've not been able to track it down again (it was vimeo or whatever rather than youtube maybe).

What we change is relationship

Right, I like that.

The only time what you're saying is potentially true is if you've already taken up much of the known universe into your own being on a conscious level.

Yes, I agree. Actually, the image in my mind was of watching television news and seeing reports of things around the world happening. It is truer to say that smashing the cup with an "attitude" can affect the rest of your experience (the apparent world), not just the cup.

one really needs to maintain a special kind of relationship

This is the interesting bit. Shall we talk about that?

Is it simply a case of settling into that background sense, to connect with it? In other words, letting go of our hold on the present moment sensory experience to access the subtle layer?

Like the sun hides the stars due to its proximity and intensity, so the texture of sensory momentary experience obscures the background dimensionless felt-sense of the world. When I switch my perspective to background awareness, I am no longer identified with my body sensations or the concept of my body, and my intentions manifest swiftly. Recently someone mentioned how they "imagined their body was an empty shell" and would just command it to, say, find a lost object or jump a distance - and then let their body do it for them. (EDIT: I quoted it here [POST: [Proposal] Investigate How to Reprogram, Build a Wiki].)

Is this the sense in which we command change in the universe, insert a new fact and then let it bubble into experience?

Or maybe it's the only way? It's hard to say for me right now.

I'm thinking that it's the only way - that all ways are basically that way at their core. I use words like "background" and "dimensionless" just to convey it's not an object or a thing.

Is this 'switch' something vivid? Is it like a pop or a click?

No, you don't experience it like that, it's really a change of perspective rather than a click - like the feeling when you change which side of a figure-ground image you perceive. But there is a difference, because in figure-ground you lose the other perception completely. In this switch, it persists but differently due to context:

So, say there is a room full of furniture. Your attention "latches on" to those objects all at once. Then you switch perspective to be aware of the space of the room. You are now perceiving the space of the room, the objects, and the space in which those objects appear/that they occupy. Really, it's just a releasing of attentional filtering. If you're in-between perspectives at the moment, you may be experiencing something more like 'figure-ground' than 'figure-ground-and-space'. Additional thought: Because we are all of experience, we can simply do this by 'just deciding'. (That's why people like Greg Goode can say - look, forget thinking it through and convincing yourself, just take a stand as awareness and see what happens. If it works, you know this stuff is right.)

When I want to insert a fact, I just train myself to expect it. This is probably not as efficient as what you're doing.

It's much the same in the end. It just might take a bit longer because you are wearing down the opposition to it, rather than letting go of the opposition?

"It just might take a bit longer because you are wearing down the opposition to it, rather than letting go of the opposition?"; This is probably true. I know I am not nearly as unhinged as I could in principle be. So my changes tend to be slow, especially if they are something I consider significant.

Yes, that's something interesting: the more significant, the more it's a "thing", the longer to push past.

If you have a point A where you currently are (at all levels of your reality), and all you want to do is leave that point

That's a good image. Freedom *from* vs freedom *to*. The purpose of dissolving limiting structures is surely to make more routes - and more efficient routes - available for the change from "here" to "there" to arise. (Simple belief that a target will become your experience can itself do a lot of "softening" of restrictions, mind you.)

Complete freedom from all structure and restriction is - empty space? Or - things exactly as they are now. Depending.

EDIT: It's not an error that New Thought approaches were all about "ignore where you are, ignore the evidence, concentrate on the facts you want to be true".

...

I'm trying to do a short version of that overwriting exercise whenever I come across something where I am avoidant or fearful (in an out-of-my-comfort-zone way). This frees me up to make a proper choice about whether to do something or not, rather than just out of habit or because I'm just vaguely worried about it - and see things as sensory experiences rather than my assumptions about it. Hopefully the idea is to be more aware of the conventions I am following, less bound to them.

POST: Truthfulness as a quality of experience.

[POST]

Convention will tell us that truth is some kind of objective thing out there that cannot be denied. But the more i think about it, when some new information or event validates how you perceive the world their is a feeling of truthfulness to it. In other words things can feel truthful in the same way things can feel sad, happy, or frightening. 1+1=2 elucidates a feeling of truth where as 1+1=3 elucidates a feeling of falsehood. If our experience is fully subjective and their is no objectivity, this idea seems to make sense, we define what is true and what is false, but without any form of lucidity we do it in a blind way rather than being conscious of it

[END OF POST]

I've been playing with the idea of two truths:

- **Direct Truth** - Something that is true by direct experience, knowing and being. This is the truth of the facts of experience. The solidity of a table, the softness of a pillow - directly, experientially true - and so are world facts.
- **Conceptual Truth** - A story or conceptual framework which is self-consistent. This is when a pattern of thought "feels right"; it has narrative coherence. A system of thought can have conceptual truth even if it doesn't correspond well to direct experience.

There is a feeling associated with both. The first is what dictates the form of your experience. However, fully adopting the second can over time affect the first, as the patterns you fully absorb can deform the structure of your mind/perception. Fully absorbed conceptual truths become direct truths.

Now, do you want direct bullshit or conceptual bullshit? Cause it's all bullshit. And separating bullshit into two piles of bullshit is also bullshit.

I think you've over-called it here. It's the difference between thinking-about something and it being directly-sensed. Like talking about "enlightenment" and "awareness" and "everything is one" as ideas, versus directly being it. Recalling our earlier conversations about the felt-sense, etc.

Call it "direct experience" and "thinking about ideas" if you like. The reason I use the word "truth" is because that's how people describe this in general, and also the idea of "truth" in philosophy and logic (self-consistent). Call it "patterns as they really are currently" and "patterns you are thinking about". Of course it's all "made from" the same non-stuff, ultimately, but it's not very useful to reduce everything to that level constantly. It is the source of possibilities, but the fact is that people's ongoing moment does consist of patterns.

At this point you realize you don't have to regard anything as more or less fundamental.

Neither is fundamental, as such. It's actually a matter of location (here and there). That isn't the problem, the problem is the habit of confusing one with the other - of seeing one in terms of the other - that people confuse that a self-consistent conceptual framework with an accurate description of their experience. This blocks development, particularly by limiting investigation by studying the "qualia" experience. The use of the word "direct" is to indicate that there is no representation involved.

They're inseparable. You can't neatly slice experience into conceptuality and qualia. Your conceptual schemes influence how qualia appear and vice versa. If you want a point of power, if you like magic, it's actually more powerful to regard conceptuality as the more fundamental aspect. That's how and why incantations work. Incantations wouldn't work if conceptuality wasn't skeletal. Moving the bone moves the muscle and skin attached to that bone

Of course, at the base level, we agree with on this - it's how magick, and indeed everyday life, works - and we've covered it in earlier discussions. Hence it must be a matter of wording and getting the thoughts right. So, the problem seems to be with the word "direct". Now, with other audiences this word makes sense, because it brings peoples attention to what is (apparently) happening in the sensory world now rather than being off in ungrounded thoughts. The point I am conveying is that we must not confuse nice systems of thought with: a) the true reality, obviously, but also: b) the current state of the apparent reality, the ingrained patterns of the world. In other words, a good story doesn't mean that's how things are. We have any number of "good stories" in our minds which we take for granted, which are without basis. We can often see those "good stories" instead of what I'm calling "direct experience" of the patterns of the present moment and felt-sense. Of course, the fact that persistently thinking about something is equivalent to experiencing it, which eventually creates ingrained habits-in-the-world, is the icing on the cake.

All phenomena are not themselves. There is no direct experience.

Isn't it better to say something like: phenomena are themselves, as experienced, and that is all they are? For instance, a "tree" literally is that image over there + all the ideas you have about "trees". But there is no underlying, "secret causal tree" at the source of that.

To say that some experience is "direct" is to imply it is non-hallucinatory, genuine, authentic, and right. Now. Do you really want to suggest something like that?

Your points are valid but I don't think they apply to what I mean here. The core is the distinction between representational (one step removed) thinking which forms a self-consistent structure that is basically a castle in the sky - i.e. not bound to experience at all. "Direct" is just a handy (for most) word to indicate the difference. People intuitively understand a "directness" to sensation rather than thinking, when it's pointed out. Of course, at the next level of understanding, the word is less useful. I'm not sure what a replacement term would be for the different context, but "direct" is okay for that level. This is a general difficulty: That descriptions applicable to one stage of understanding have to be revealed to be "not quite the correct story" at a later stage.

phenomena are themselves Of course not. I hope you're joking.

What do you suggest "phenomena" are?

You're saying you can cleave experience neatly into representational and non-. I am saying you can't do that.

No, that's not really what I'm saying. This is actually a subtle topic, mind you. However, thoughts-about things are not the things themselves. Self-consistent theories about awareness are not awareness, and so on.

You can insist on a difference ...

This is where context comes in. At one "level" there is an apparent difference which seems obviously the case. Then...

Anything you want them to be, except themselves.

It depends what you mean by "themselves".

When I do this, the thing-itself is gone after I remove thoughts-about-it.

Right, the experience of something is the full thing (the image and all meanings). Bringing a thought up about it, we summon the meanings without the "external" image. So yes, for a "tree" or whatever, they are the same thing, it's just a matter of location.

So - when I speak of Conceptual Truth I am talking about were structures, associations or stories. So, a theory about something ("how it works" and "what it is really underneath") which feels true because it fits together like a puzzle, but in fact doesn't really point to anything.

The word here to use is perhaps "relationships". The framework is a set of fictional relationships between the thoughts. Again, though, we have the problem of levels of understanding - because if you truly accept a set of relationships, the world can start to seem as if it behaves according to them. That's feedback for ya.

I don't know if you realize this or not...

Right. That's what the felt-sense thing is about. The meaning of a tree is felt, known, because you are or become that. You experience that tree and all trees. The felt-sense is the facts-of-the-world.

Maybe I could only hear, because I didn't have the conceptual framework for evoking a sense of sight using volition.

This is a good one. Or even just the first time you saw a tree, you wouldn't see a "tree". You'd see... green blobby bit on top of brown uppy-down bit. Which is a good question....

How can it be possible for us to experience a tree for the first time?

I agree. But what you're saying is that you can somehow bracket the relationships and examine things outside relationships and still find the same things, just without the relationships. And I am saying, that's impossible.

They are entangled, it's true. It depends on the extent to which the story is accepted, absorbed, experienced. Maybe it's better illustrated by example. Say I have the story off: marble rolls along floor, hits marble, second marble rolls - this is cause and effect, this is momentum, this is energy transference. So in my mind I have a "conceptual truth" about it. With the senses, I just see two spheres rolling. But I felt-sense it as "marbles" and if I know about physics I felt-sense the event as a cause-effect, energy-transference. If I believed that marbles contained "motive spirits" then I would felt-sense the event as an interaction of spirit personalities, entering an agreement to exchange motion.

Aside: Today's random truths along with poor soundtrack [<https://www.youtube.com/watch?v=ZgiwVYZM5A8>].

When he experience this new way of forming sens-impressions, he really was confused and was asking questions about it to try to conventionalize his experience.

Interesting. We also have an extra trick here: that we experience experiences, knowing. When we go checking whether we "see" or "hear", then sure enough we do, but that's because we went seeking for that experience. When I "see" a door over there, normally I don't see it at all, I have a total door experience which isn't separated out into individual senses necessarily. The channels are learned to be separate. That arbitrary separation limits the nature of the experiences we have. For instance, it leaves no name

for the felt-sense so people don't notice it; it leaves no name for the ability to feel-aware out into the space around you and into other objects and people (which we might call "presence"). In fact, apparently-personal experience really is about that feel-aware thing. Try withdrawing that sphere back into yourself, and you'll quickly discover you "go blind". You might still kinda see stuff, but it's like peripheral vision, and you don't have the sense of meaning.

You see shaded circles, and they're not rolling, they're just moving. :) But if you keep stripping it down, then the circles will need to go.

Yes, this is of course right. So here we go, we're getting to a better description for the oneironaught vs the everyday guy:

The difference between (what I called) Direct and Conceptual truth is simply the extent to which a pattern has become ingrained, stabilised, become a fact-of-the-world. This is of course a continuum; the two terms indicate the extreme cases.

So for example, I realize the cup is to the left because I can imagine it being in all sorts of other locations. I don't actually have to imagine it, just the fact that I can, if I want to, means I have tacit imaginary context that I am using to give meaning to the cup's location.

Yes, you instantly are aware of all the possibilities of "cup-ness", because that's what "cup-ness" is.

There is no experience that corresponds to the Direct extreme. I hope you realize this.

Sure, neither extremes exist, although the idea of the extreme is useful for gaining understanding at a certain level. If you are having any experience at all then you are experiencing a concept, albeit of an extremely subtle, low-amplitude form. I mean, even the concept of a "concept"... arrgg, there is no escape! Ah, but yes - take a step back, switch context.

I think it's dangerous.

Well, I think you and I have an ongoing disagreement about how to describe things. You seem to prefer a jump-to-the-end approach, whereas I see a staged approach as better. Depends on the audience, really

You're right that getting stuck at any conception is a risk.

Illusion

Always a tricky word. I like the "playdough of experience" metaphor though. :-)

...

From last week's episode of Constantine (spoilers):

Lily wakes up to rejoin the living world, but John and Ritchie remain in the construct. Ritchie wants to stay behind in his own reality, basically as a God, so who can blame him?
Constantine can. He warns his friend that he’s eventually going to go as crazy as Shaw, and that his decision isn’t about creating his own world, it’s about running away from the real one. Having regained consciousness, John pleads with Ritchie, still in his altered state, to come back to him ... which he does after a few moments of hesitation. Having found new purpose, Ritchie puts more effort into his teaching position, lecturing about humanity’s certainty of suffering, giving into cravings, and the possibility of inner peace.
-- Constantine Season 1 Episode 11 Recap

Maybe you should quit all this reality-messing, playing God, and just get a nice teaching job.

Do you really believe this?

No, but I do enjoy the show and it sometimes gives me a bit of food for thought. (And it's interesting when the topic of a TV show synchronistically relevant. Although in my reality I wouldn't be hacking the hands off innocent kids. Promise.)

I like being encouraged to question myself occasionally - particularly in "these matters". Because it's easy to go off-path.

You might prefer another quote:

Ritchie: “All this time you’ve been here, you coulda been building worlds. You coulda been redefining life and how we live it. Instead you gave into your weakness, and when you did, that’s the day you became obsolete.”

Q: I figured you were just testing me. It's a waste of time. I am well beyond all doubt.

But... aren't you tempted? Don't you think this might be a fascinating distraction? Given that the world you are experiencing right now is your creation anyway?

If I wanted a distraction that was really fascinating, I'd rather be distracted by massive displays of massive personal power.

But you already have (had) that power. And you chose this. It's difficult to tell how much of this we might have chosen previously. Have we burdened ourselves with an adventure which is nothing but challenge?

Perhaps the purpose of this is to teach yourself acceptance. That you will realise that you are struggling against yourself, that the power you seek is illusory, you have already made a decision against it, and it's simply a matter of you eventually giving up and accepting.

Or not. Who knows. ;-)

For the old decision to have force you have to ongoingly consent to it continually.

My "concern" would be that a person can be unaware of the old decision. This is an opportunity: I still don't like the "ongoing decisioning" language. So how about this:

- Our intention is the temporal landscape of our world, which we experience moment-to-moment, laid out timelessly. It is equivalent to the fact-of-the-world. To say "we have an intention" is just to say "my landscape is this shape", to say that what I am is this shape.
- To intend is to change that landscape. We intend by simply changing our shape, since the landscape is us. We become the result, even though the facts we have inserted might only unfold as sensory experience at some point in the apparent future.

So (being dualistic for a moment), your intention is the blueprint and to intend is to change the blueprint.

We can be aware of a result, which is now.

This is true. And I don't believe in irretrievable decisions. You might choose at one point a nasty outcome (unwittingly), but once you understand the nature of things, you can recognise this is a bad unfolding, and correct it. I was definitely a full-time idiot in the past. Now I'm just part-time. :-)

I love it though.

I know you do! I am resisting though. :-)

My main bone is that you think decisions are like some kind of brief bursts that can be dated on a timeline, like you can pin some decision to 6am Monday morning, for example.

There are a few things going on. Some certain intentions could indeed be tied to a particular time, where we say "I change this part of the landscape". Meanwhile, because the world reflects your nature, as you evolve by accepting and developing your ideas and yourself, there is a continual evolution of the contours of the landscape. Finally, in any case intending doesn't just insert a particular event. It inserts facts, which mutate the landscape as a whole. All of these are the same things, really, just particular cases. Appearances constantly change because: The landscape itself is evolving due to intending; We are "traversing" the intention landscape by unfolding and refolding "moments" from it. Again, these are basically the same thing.

As for changing the blueprints, you can have a blueprint for how to change blueprints. And then you can change that meta-blueprint as well. Etc.

Hey, I placed no restriction on the number of dimensions those blueprints have! ;-)

This is what I call decisioning. :)

Okay, we'll let you call it "decisioning" for now then, I suppose. ;-)

This is the level where most people would say I was going crazy, or, if many people experienced it with me, they'd say it was a coincidence and I have no moral right to claim what happened for myself as my own volition's doing.

Right. This is where the notion that our decisions happen "the long way round" is useful. You don't move the arm that you can see, what you do is insert a fact into the landscape such that you will experience "arm movement" in a second or two.

We had this conversation before, but it's worth us restating: That we place arbitrary boundaries on "us" and "world" based on apparent distance and body-sensation, and the self-created tension of "doing". This leads us to arbitrarily see some experiences as results of ourselves, and others as happening to us. In actual fact, all intending affects the global intention/landscape, as extended time-and-space patterns (or more subtly). You might not deliberately intend the sunny day today, but at the very least you implicitly "decisioned" a weather system such that sunny days are possible. All kings, no subjects.

"You don't move the arm that you can see, what you do is insert a fact into the landscape such that you will experience "arm movement" in a second or two."; This isn't immediately obvious to me. I find the idea interesting. But how exactly is it useful? What can you do with this approach that you can't by thinking you're just moving your arm about?

It's vital, I think! We adjust the felt-sense not this current "arm experience". For practical everyday circumstances it doesn't make much difference, but seeing it this way removes the difference between creating humdrum physical motion and changing the weather.

Yeah, you're saying it's a good thing. But my question was, what can you do with this style of thinking that you cannot with the more conventional one?

Accepting it removes the attempt to experience "doing". It leads to effortlessness, wu wei. And leads to a direct knowing that the movement of your arm and the movement of the clouds are the same. So the benefit of it (on-theme with our earlier chat) is that accepting this will "decision" your experience into a better, clearer, more powerful one. More enjoyable.

Ah, finally. This is interesting indeed. Well worth the long trudge through however many posts we exchanged. I'll have to think about this more.

The trudge was the result. Have a play with it, be interested to see how you find it.

So do you live this way? I mean, you no longer think you're moving your arms about or whatnot, when your body is moving?

It's identical to that thing I was saying about "switching perspective" to the background (with the usual language caveats).

I do get caught up in "doing" now and again, but that is a reminder to switch. Before this, I was a major do-er of things. Everything was about applying deliberate tension.

Did the switch to fact-insertion thinking happen gradually?

Once I got to the "timeless landscape" thing then it seemed to follow, from the metaphor of the mirage and the desert and all that. But it took a while to connect it to the wu wei thing I'd been looking into years before and the whole thing about trying to detect when/where exactly I "do" things like deliberate arm movement.

LOL, you're still doing things. You're just more subtle and crafty about it, and more relaxed.

Ha, no there is a difference. I've done the sneaky-crafty thing too! It's the difference between the whole world moving together, all from/of/as that same place. The more I talk about it, the more I pollute it by implying something else. Always the way with me! :-) Refer to my original words and ignore the rest.

Even if the whole world moves together, you're still engaged in doing because you're guiding the world to just one destination among infinite possible ones. As effortless as you appear, you're still using volition. Inserting facts is using volition. Still doing. Just a subtle kind of it. Doing is that for which you take responsibility.

That definition of doing sounds a lot like decisioning! ;-)

I understand the concept, but to actually live like this is entirely different. This is the kind of thing that happens gradually over decades or lifetimes, but is expressible in a single sentence or two.

(Loosely speaking) you could see it as living from the landscape of the felt-sense, letting unfolded experience take care of itself. Just try adopting the idea by simple decision; see how it plays. "Imagine it is so" and see what happens.

But I can't conceive of experience as "itself." There is no "it" to me.

I know. Excuse the language thing!

I already do this when I do magical transformations. :) But when I move my arms and legs I still think the old / conventional way.

Right, it's the same. It's just about bringing it to the mundane.

POST: What is time?

[POST]

What is time?

Take a minute to repeat that question to yourself a few times. Slowly, ideally, so you can take a step beyond contemplating it intellectually and actually start investigating the reality you're experiencing presently.

What is time? How long is the present moment?

Stop reading, turn your head away from the screen, and actually spent a minute or two on that. I'll wait.

So it's a fairly unconventional thing to think about, and this is made obvious by how difficult it is to really contemplating the question using word-thoughts.

For me, the most basic way that I tend to think of time is as the perceived non-simultaneous, non-instantaneous quality of experience. Everything doesn't appear to be happening all at once in a single moment. Things seem "spaced". Well, that leads us to some questions: in what sense are all things not simultaneous and instantaneous?

What do I mean that everything isn't happening all at once?

Well, it seems that I can remember things that have happened that are not currently happening, and I can imagine things that could be happening which aren't. But neither the past nor the hypothetical present or future have any genuine existence in what I'm actually presently experiencing, and so there would seem to be a sense in which I cannot really say that anything has already been or could be happening which is not presently happening. This is a fairly familiar concept to most, I assume. The past and

future "borrow" their reality from the present.

So, since describing time as the quality of experience by which things aren't all happening at once, we're left without a satisfactory explanation for what time really is. Is time an illusion entirely? Well it certainly seems that things have happened "before" now -- it doesn't feel as though each moment, reality is essentially recreated as near-identical to before. But even thinking in this way presupposes the existence of time. It is difficult to think in ways which exclude a temporal aspect entirely.

If time is "real", we can ask ourselves how it came about. It doesn't make much sense to think of time as having had a beginning, because a beginning implies temporal causality (i.e. one thing provoking another by virtue of having happened before it so as to bring about a change). We could imagine a Self, or Brahman, or God, entirely outside of time, or experiencing a very "different kind" of time, in which causality is no longer a relevant factor. This is a bit like if humans experiences a film frame by frame, they might perceive one frame as -causing- the next, but from the vantage point of the True Self or God, all of the frames would be laid out and perceived "at once". But then, why should we perceive time in the causal way that we do?

What's perhaps interesting to contemplate, here, is that the linear, causal way of thinking about time is a relatively new one. Judeo-Christian ways of thinking, in particular, made the linear and causal way of thinking about time the cultural default, as you can learn about in detail elsewhere, because it is a way of approaching time that makes Original Sin and the Death of Christ genuinely applicable. Judaism and Christianity have uniquely emphasized the historical and conventional facts and their causal relationship with practitioners. Punishment and accountability only work in linear, causal time. Before this influence, however, the most common way of thinking about time was as cyclical.

Cyclical time is often thought of in the sense of Mayan calendar cycles, but this would be like thinking of linear time as the Gregorian calendar. Focus instead of the subtle quality of experience that cyclical time lends itself to, like the quality of experience that linear time lends itself to (i.e. strict causality, a determined and unchangable past and an unknowable future which cannot influence the present).

The quality of cyclical time is far more interesting than the linear, causal, conventional way. In cyclical time, causality is very different. Where on a number line 1 leads to 2, which leads to 3, on a circle, 1 can be said to lead to 3, but 3 can just as equally be said to have laid to 1. Thinking about this inverse in causality for a while is worthwhile. Whereas in linear time, the future is some empty, unknowable, non-existent void, in cyclical time it is granted a relationship with the present that is on par with that of the past. Events in your memory have "caused" the reality you're experiencing presently, but in a very real way, things that you conceive of as having "not yet occurred" have just as much influence on where you exist right now (though if you've got a mental image of the circle, the distance is obviously much greater between 3 and back to 1 again, ergo the less obvious connection in conventional ways of thinking). In cyclical time, the present moment is the re-actualization of something which has happened "before" and will happen "again" -- only the past, present, and future have all had an equal influence on one another because the concept of before-then-after causality doesn't apply here. I find this a hugely interesting thing to think about. Maybe a few of you will read this and, seeing it fresher than I can, it will inspire further thoughts on the subject that I'm able to conjure. I'd love to hear them.

[END OF POST]

Good stuff. Something that fascinates me is the way we represent time in our minds metaphorically, and how that influences our approach to it. We literally experience time as represented in our perceptual/thinking space!

This is different across different cultures too:

- Western people tend to imagine time as running left to right on a "timeline", literally in front of them. Past is to the left, present is directly in front, future is off to the right. All time is visible and the causal nature of past=>present=>future is implied.
- Some other cultures have time running back-to-front (so to speak). The past is behind your head, out of sight. The present is directly in front of you. The future continues onwards into the distance. Here, the past cannot be seen and the future is obscured by the present moment. Causality isn't clear - only the notion that you must get past the present in order to access the next moment in the "future".
- EDIT: Just reminded that my Dad used to imagine time as a sort of simmering bubble floating off to one side. All events were sort of "dissolved" into this. It was an ongoing present containing all moments in time.

Think of how dramatically our approach to living can be altered by which visualisation we adopt.

...

"But neither the past nor the hypothetical present or future have any genuine existence in what I'm actually presently experiencing". I definitely disagree with this. What you're saying privileges the apparent over the latent in a way that isn't warranted upon closer examination. In fact to cognize a cup's location on the table I must have some sense of where else it could have been but isn't.

In fact, one of the basic errors people make - once they think beyond just things being "objects" - is to assume that a cup is just that visual image plus touch sensations. Actually, what we experience is an entire cup-ness which is entangled with its context.

Yea, but if you say it like this, it becomes hard to understand to anyone who isn't living in your own mind. That's why it's necessary to unpack this more if you really intend to be easily understood by other people.

Hmm. What I mean: So, cup-ness would be all previous experiences with cups, everything you have heard about cups, combined with everything you know about the current place where the cup is - all folded into a single knowledge-feeling.

...

Yes, I'm not too keen on the delivery myself - I'm not a fan of that whole 'channeling' thing - but the principles definitely and many other views are fairly in tune with 'this stuff'. It's put more straightforwardly than Seth and ACIM, for instance.

1. You exist.
2. The One is All and the All are One .
3. What you put out is what you get back.
4. Change is the only constant...

Except for the first three laws, which never change.

POST: Have any of you made it to the mental plane?

You'll need to expand a bit on what you mean by that.

in some occultism there is a hierarchy of the physical>astral>mental and spiritual plane. The mental plane is the one beyond the astral i think in this context

Ah. Isn't that where you go pretty much every night? By which I mean, the unstructured void space in which environments are created.

...

%darkblue%A1:%darkblue% Have you made it to a non-mental plane?

POST: Synesthesia and the deeper nature of qualitative experience.

[POST]

One of the common misconceptions that people make is that one needs a physical brain and physical senses in order to have experience. AKA You cant experience color without eyes, music without ears, smell without a nose etc. As someone who has multiple types of synesthesia i have realized this is not true at all. My main types of synesthesia are associating numbers and letters with colors, associating sound with color, associating color with sound, associating sound with taste, associating color with taste. The more interesting of the two for me is both associating sound with color and associating color with sound because it creates a really weird sensorial feed back loop. In other words in an internal sense, the distinction between color and sound are blurred and may both be the same type of experience filtered through different sensory experiential refractors from my point of view.

Whats really strange though is when i hear a sound which causes an experience of color, i dont see the color with my physical eyes, i feel the color within my sense of being. Same thing when i see a color and associate it with a sound. When i enter an orange room, i will experience the sensation of the note C flat, but i wont physically hear it, i will instead feel the quality of C flatness within my being.

What i've realized is that the idea of color only being a phenomenon associated with seeing and light or music only being a phenomenon associated with hearing and sound waves is yet another aspect of human convention. Orangeness and purpleness are merely qualities of mind beyond the category of seeing and light, because orangeness and purpleness can exist within sound as well as taste, smell, and touch. The five senses merely divide experience into separate categories in the same way a prism turns a white light into the 7 colors of the rainbow.

Here is where it gets really weird thought. Some of these synesthetic experiences i have posses no analogue to this particular phenomenological world. When i taste some sounds, sometimes they cannot be related to any tastes of food in this world, at best i can make vague approximations of sweetness or fruitiness, but there is nothing else like it. Or sometimes color schemes will invoke feelings of notes, chords, and instruments that have no basis in this dimension. I've been thinking today that my synesthesia may be opening up my mind to aspects of experience outside of this world, things thought to be impossible and incomprehensible. perhaps the reason we cant see into these deeper outer experiences is because we cling to the conceptual island called an ego or the idea of being a brain, which in its self creates the limited perception. But my synesthesia seems to be a doorway to some other mode of experience, in that i have these experiences in my mind and being but my five senses have no way to categorize them or fit them within their prism, like trying to fit a triangle through a square peg. I as awareness experience the triangle in my hand but my sense of sight is like the square peg in which it cant be filtered through to create a refracted experience.

What if when we are unconscious in deep sleep, we actually do have experiences, but because we are so rooted in our egos five sense interface, we have nothing to bring back from it. like fitting a triangle through a square peg. But through cultivating a certain type of awareness, maybe even non synesthetes can recognize the qualities of experiences light and color and sound and music as one pure experience. It is in a sense recognizing that one can have these types of experiences outside of sensory experience refractors, and perhaps defining the five senses as a kind of experience limiter, one may access deeper types of dreams and understand a level of being and a type of experience outside of the dimension of material conventionality.

[END OF POST]

[QUOTE]

Synesthesia

Synesthesia (American English) or synaesthesia (British English) is a perceptual phenomenon in which stimulation of one sensory or cognitive pathway leads to involuntary experiences in a second sensory or cognitive pathway. People with synesthesia may experience colors when listening to music, see shapes when smelling certain scents, or perceive tastes when looking at words. People who report a lifelong history of such experiences are known as synesthetes.

A person experiencing synesthesia may associate certain letters and numbers with certain colors. Most synesthetes see characters just as others do (in whichever color actually displayed) but they may simultaneously perceive colors as associated with or evoked by each one.

[END OF QUOTE]

So, the "five senses" could simply be a category scheme that we've become attached to, and filter through. This limits what experiences we have, but those limitations aren't inherent to experience at all. We are effectively choosing this channel-streaming. An article over at Aeon magazine talks about synesthesia being the natural state at birth. Does it get pruned back because we adopt or submit to the notion and experience of separate senses, when of course in "mind" there is no such distinction?

I've experimented with my senses quite a bit, and if I let go of seeing and hearing, it returns to a blended experience of "meaning". As soon as I try to see with my "eyes" though, for instance, my experience turns "eye-shaped" and vision seems "partitioned". If you go checking for sense separation, I think you imply its presence, and get what you are looking for. I don't have obvious synesthesia, but movements and patterns definitely have "sounds" associated with them, for example, and colours do have a mild texture to them. So, do you become more synesthesia-ish when tired or relaxed generally?

Q2: i honestly feel more synesthesiaish both when im relaxed, and in a more positive mindstate. Like if im worrying about some inner anxiety, im not noticing the external world as much and hence less associations.

actually the things you described might be a form of synesthesia, as it manifests in many different ways. The thing is, a lot of people who have it don't realize they have it, they just assume everyone else experiences the world the same way they do.

It is I think, but pretty mild. I hear sound effects accompany real life projectiles or for animated gifs, for instance, and the animation on this page about clustering illusions has white-noise/electronic-noise that evolves as the clusters form. Basically, it's like I do my own real-time Foley work (sound effects) for the ongoing movie of my life. Next up I need to master ADR (overwriting dialogue) for when I don't like what people are saying to me!

I've thought that those two ideas are potentially powerful for a bit of reality-twisting if applied in the correct frame of mind. It's a bit like a New Thought technique.

...

Supposedly, the word "capacitie" was originally used by the poet Thomas Traherne to describe an aware ego-less space in which experience arose (see here), then Douglas Harding took that and used "capacity" in his books:

Pointing Home

... looking inwards, turning the direction of your attention round 180° from the objects out there to you the Subject, to the place you are looking out of. Do you see your face? Do you see anything at all there - any colour or shape, any movement?

Looking in to the place where others see my face, I find no colour or shape here. I find boundless capacity or awareness this side of my pointing finger. This capacity is empty, clear, transparent. It is self-evidently awake, aware.

At the same time this capacity is full of everything happening in it: my finger, my view of the scene beyond, sounds, feelings...

I am now seeing Who I really am – seeing the boundless One at the very heart of myself, the One in whom the world is happening.

What do you find? Are you also looking out of this wide-open, crystal clear, awareness?

-- Experiments, headless.org

It's a really nice way of capturing it. It dodges the "potential for/of" problem. You are simply capacity, without qualification.

EDIT: My Spirit by Thomas Traherne here, excerpt:

*I felt no dross nor matter in my soul,
No brims nor borders, such as in a bowl.
We see. My essence was capacity,
That felt all things;
The thought that springs
Therefrom's itself.*

...

*Q1: I think I pretty well explained my objections to defining mind as a capacity in my response to Utthana, but I'll touch on them again here.

1. Potentiality only makes sense in terms of actuality, and vice versa. Like light and darkness. To define mind as potential is incorrect in the same way it is incorrect to define mind as light.
2. A capacity is unchanging for eternity. You change and develop, but your capacity does not. Therefore, you can't be a capacity.*

I'd say that's why it's phrased as "boundless capacity". It's not capacity for a particular things, but open capacity for all experience - it refuses nothing, it has no restrictions. That way in which Traherne uses the term makes clear it is not an opposite: he does not mean capacity is structured or an object; it has no opposite because it is neither one side nor the other. Still, it was just another attempt for an author to use a novel word to imply something unlimited and without duality. These work for a while, then someone suggests the opposite and that it is limiting whilst the true nature of it all is without limitation. There exists no word that can't be shot down for having an opposite.

POST: Free Will and Predestination: Your Tyranny as Freedom for Others

Really been enjoying your post and comments. Your descriptions of the 'ultimate truth' of things is very clear, and that your world is a combination of your intentions-so-far. But also wondering, practically speaking...

You can choose to shift into the reality where that is already happening in their intent and in the process of unfolding. . . By implication, you can force it to be the case that someone falls in love with you freely, or becomes lucid freely, or commits suicide freely.

How does one choose or force, in your understanding? Is it enough to simply make the choice, is it a case of 'allowing' it because it is already your intention, or is there something more specific to do?

For example, how would you force someone to become lucid?

How do you raise your right hand into the air? If you give the (I think, not quite correct) answer that you tighten and loosen certain muscles, then how do you tighten and loosen those muscles?

I think those who move their arms by "tightening and loosening" are like those who think step-by-step to solve a problem. They are intending through graduation rather than intending the result and allowing.

I think that sometimes we have to give ourselves permission (or allow ourselves) to exercise certain intentions, but I think the intention to act is separate from the permission to intend to act.

Hmm. I've previously been unsure about this "choosing your reality all the time" view, but I think in the end it was just a matter of perspective.

- Where there is greater resistance to a direction, one must more deliberately intend.
- Where there is minimal resistance to a direction, simply deciding is sufficient.
- When there is no resistance to a direction, it is effortless and we are unaware of our creation, because we are simply experiencing our beliefs, manifesting spontaneously.

Because the final one involves no conscious act, as it were, I've shied away from calling it creation, but really it's just terminology. Essentially, all manifestation is a matter of adopting beliefs ("inserting and accepting facts" as I have phrased it) and your experiences will subsequently line up. Deciding and intending are just the experience of overcoming some belief push-back or doubt associated with a goal. The actual appearance of creations, the manifestation itself, is always effortless.

Would you agree?

I think the intention to act is separate from the permission to intend to act.

I guess it could have levels. There can be resistance to performing the act at all (resistance to using your power to achieve an outcome) and then the experience of the intention (resistance to the possibility of the desired outcome).

(Making someone lucid) ...ut to decide that, you need to be aware of what beliefs you are manifesting presently and what options you have instead and what they would feel like...

Yes, this makes sense. Forcing someone to become lucid is actually a matter of allowing yourself to experience then becoming lucid. I guess this doesn't need to be a two-step process necessarily. If you asset a new fact ("my fist will be clenched") you will get immediate feedback if there is a problem ("already clenched!"), just by doing the assertion and while pushing through it. Resistance might be factual ("already done!") or belief-based ("that's not possible!"), but either way if there is a barrier to dissolve or move through, it is revealed.

Yes. As a matter of preference, I would shift the emphasis from: "Where there is greater resistance to a direction, one must more deliberately intend." to Where there is greater resistance to a direction, one must more deliberately intend.

Agreed on the change of emphasis, since it better implies the resistance aspect.

It can turn out, quite suddenly, that someone you never suspected was in love with you or was a serial killer or is a master of divination.

Or, plot twist: all three.

We could view ourselves as "extended persons", expanded across a grid of all possibilities. There is an aspect of you corresponding to every possible situation or configuration. Which configuration you end up looking through as your "viewport" is a matter of intention. (Something like this [POST: Meta-switching realities].)

Sure, that's a valid perspective. I think the ideas of individuals and realities and minds start getting uprooted if we talk like that and I was wanting to write something that was relatively palatable and useful within the context of individuals, realities, and minds.

And it is just a way of thinking about it - in the same way there is no such thing as a timeline, but it's a handy diagrammatic convenience. Intersubjectivity is the biggest stumbling block to acceptance of the dream-world view - are other people real? are actions which involve them ethical? If I am the active entity, is everyone else "hollow"?

Having some way of visualising an arrangement which allows for multiple perspectives where everyone can still get what they want can be helpful I think? Although none can ever be completely satisfactory.

...

If you 'get out of the way' then things will simply continue in accordance with your intentions-so-far, as encoded in your beliefs, habits and expectations. This is not a special state of affairs, therefore. Except that without interference your less firm intentions might fade and stop influencing events. Attribution of different intentions to different 'levels' is just an arbitrary division in thought. There is only one mind, one structure, one experience.

You can't get out of the way of yourself at the level of mind. You're not in the way to begin with. You are just you doing what you are doing.

Actually, I was using that phrase because the poster above used it. Not interfering to me means... well, see below.

What you're talking about is relaxing, which is not you getting out of the way. It is you doing something different. Effort and relaxation are just modes of manifestation that you do.

I disagree here. Given that we are not talking about the physical here! You can 'cease creating' or 'cease adjusting your creation'. Since what you created was created with persistence - momentum and inertia - it doesn't just disappear. However, doing this leaves you with whatever patterns you've created within yourself so far, perhaps unintentionally (as in, unwittingly). So it's not a return to some special state. Although it may allow you to see where you are more clearly. Effort and relaxation are experiences within mind - they are content. So that's not what I'm talking about. It's more akin to taking a break from splashing the water.

At every moment, you are maintaining the appearance of 'stable' things...

All content is manifested (more generally, all experience is manifested), for sure. And I get where you are coming from now. Along the line of, for instance, I can manifest the property of stability of experience, without being specific as to the content - just as I can manifest time going fast or slow, without adjusting the speed of individual apparent events.

The problem is that ordinarily we think that water has an actual natural way of behaving when we don't interfere... What I'm suggesting is that you see those rules as tentative commitments like external rules of reality.

Actually, water was a bad analogy because it's dynamic, it was that or the 'blanket metaphor'. But there's no thorough analogy really I suppose - - -

So yes, at the ultimate level I agree with you. At the ultimate level (excuse the use of the metaphor) there is no structure or non-structural - it's the "non-material material". It has no natural trajectory, because it is not a thing, and there is no context. I was still talking within our commenter's terms, I suppose. When I was referring to 'not interfering with yourself', I was not so bound up with mental and physical aspects and 'relaxation', but you are right that I was starting from something structural beyond simple 'open awareness' - I was beginning with the existence of the properties of persistence and momentum, although unattached to a particular object, and the notion of a 'held perspective'. Our original commenter was talking about dropping direct manipulation, but was really only dropping down a 'level' - basically identifying with the 'space' in which content appears while not interfering with (i.e. actually continuing to identify with and accept) any patterns that were already in motion. Treating them as special. Then, letting-go further drops you out of those patterns also. A further letting go might rid you of persistence. (Obviously, 'letting go' is a metaphor for a certain intended effect.)

What's interesting is that we can have aspects of creation that are apparently completely invisible to ourselves. Basically, 'facts in the world' that have an influence, but become so accepted that you just don't see them. Simple continuity being one of them?

...

It's never going to be easy. As soon as you start talking about anything other than 'formless awareness', you are talking about manifestation. And each person lives in a manifested world which matches their beliefs, which seem self-evidently true. Whatever you say will seem incorrect in their world, unless they are entertaining doubts. So you try and refer back to some more basic level - ideally just awareness, but then how to communicate that to someone who has thought and experienced only in terms of form, and particular building blocks at that?

So really we do just communicate with ourselves, to improve our own understanding (as ourselves and as other people). In the end, it's just talk, and if people aren't willing to go the distance with direct experimentation or full commitment, they'll just have 'Conceptual Truth' (a coherent thought system) but no corresponding 'Direct Truth'.

Awareness is only a reflective or beholding property of mind. I believe you're simplifying things too far by going for awareness as the common base. The simplest basis that still works adequately is mind, not awareness.

Which just highlights the difficulty with words. Depending on who I'm talking to, the words "consciousness", "awareness", "mind", "larger mind", "higher self" become appropriate - even if not appropriate to me. And the way you used "awareness" just now would be replaced with "attention" or "attending" or "self-awareness/consciousness", again depending. The problem with "mind" is that everyday folk often use that word for "their thoughts and feelings".

TL;DR: There is no universal word for the "common base", and all words imply an object or division when there is none. Although maybe we can just call it... The Common Base. Other traditions call it The Ground of Being, etc.

Yes, ordinary people have an incorrect view of what mind really is. But intuitively calling their attention to their own mind is bull's eye anyway

Yes, this is why in-person dialogue works best. You can detect how they are interpreting, and also refer directly to actual experiences than talking in the abstract.

Awareness is not overtly associated with memory the way mind is. Awareness is not associated with making decisions, volitional activity, the way mind is.

I often end up starting with "awareness" because it has no connotations, relatively speaking, except with "being aware". You can then add in all the other structured goodies. Begin with something like the passive process story of random experience leaving memory in turn affecting experience, and then build up to the "active", shape-changing stuff. Depending on the discussion.

On some abstract level there is ineliminable division. For example, when you assert lack of division, you're separating it from the possibility of division. So you're employing discriminatory, segmenting awareness here.

Well, exactly - I even went too far by using further words. "Not division, not unity" would be more accurate. And even then, that implies it cannot be, which is not correct...

All words have wiggle-room unfortunately. Take "belief". It is common now for people to take "beliefs" to be whatever story they say to themselves and others to make themselves feel better. Hence, "positive thinking" and The Secret. But that's not believing - that's hoping, and self-deception.

Yea, it has a connotation of passivity

Which is perfect, as a starting point.

belief is still a great term that should be used.

Not suggesting it shouldn't be used; just suggesting it needs to be redefined. As you say, understanding the true nature of belief is vital. Both of which highlight something important: communication of truth can rarely happen all at once; we often need to go via a series of half-truth stepping stones to build the bridge from people's initial (mis)understanding.

"Which is perfect, as a starting point"; I don't agree.

That's your lack of imagination. ;-)

Passive experience is the perfect starting point because that's where most people begin: experience leaving traces informing experience, while being unaware of it, assuming their world is "external". You can observe this and gain an understanding of the mechanism. From there, you can understand what reforming the world means: reforming yourself. Of course, that takes a but if courage. Belief is then redefined from "thoughts I have about stuff" to the actual structures which are affecting my experience /

defining my world. In short, the memories or "facts" I allow. It's then clear what it means to change your world and how to accomplish this - and why some of the commonly promoted techniques usually do not work.

I agree, but I hope this isn't an excuse to give some seriously substandard ideas to newbies. It's wrong. Some newbies are actually highly seasoned practitioners from past lives and deserve better.

Which is why there is no single approach, and dialogues work best. There's no single best path because that implies a single starting point. As you imply, even getting someone at birth does not mean you can use a general approach!

It's got to be collaborative. And if people won't actually try to assert modifications to their world, if they only want to talk about it - fun though that can be, there's going to be little progress, beyond the benefit of passive absorption of new conceptual frameworks tweaking experience a bit.

What you're doing is assuming everyone is a moron and first start them with a flawed idea. Bad! You're following a model of school education where knowledge is given linearly from simple to more complex, building up and up. That's ineffective and slow.

You're totally wrong. ;-) It's not about people being morons, it's about being clear in your communication and building up from the broad picture - so you don't have to stop halfway and redefine what was meant by words like "belief" and "awareness". It's not slow, it's actually quicker than backtracking. If you're on the same pare, progress is fast because you get straight to the meat of the matter. Spira, meanwhile, doesn't have a model, he simply has a process which points out that you are not the "small self". It seems to work well. He doesn't seem interested in modifying the world after that, so those interested in making further changes must look elsewhere. But he's not selling "powers" or a metaphysics, and is pretty clear he is not personally interested in having a theory or a method. He's good at what he does; he's no good at what he doesn't do. Fair enough. So, give me "the most sublime conception", in your best words.

There are amazing people out there and you give them 1 to start?

I think I was pretty clear that in a **dialogue** you find your common ground quickly and progress from there? That's the approach of mutual respect. You keep suggesting that I'm suggesting a ground level, one-way broadcast type of thing when I'm not. You're arguing against a point of view that I am not actually advocating.

EDIT: Ah. See, they're not stages I'm describing.

As far as I'm concerned, the quicker we get to the good stuff the better - I'm not interested in being a teacher, I want to acquire additional tools - but we can always learn better ways to communicate the other stuff. I do however like your quote.

[QUOTE]

Here's what Vimalakirti Nirdesa says about this:
Purna replied, "Lord, I am indeed reluctant to go to this good man to inquire about his illness. Why? Lord, I remember one day, when I was teaching the Dharma to some young monks in the great forest, the Licchavi Vimalakirti came there and said to me, 'Reverend Purna, first concentrate yourself, regard the minds of these young bhikshus, and then teach them the Dharma! Do not put rotten food into a jeweled bowl! First understand the inclinations of these monks, and do not confuse priceless sapphires with glass beads!'"
"Reverend Purna, without examining the spiritual faculties of living beings, do not presume upon the one-sidedness of their faculties; do not wound those who are without wounds; do not impose a narrow path upon those who aspire to a great path; do not try to pour the great ocean into the hoof-print of an ox; do not try to put Mount Sumeru into a grain of mustard; do not confuse the brilliance of the sun with the light of a glowworm; and do not expose those who admire the roar of a lion to the howl of a jackal!"
"Reverend Purna, all these monks were formerly engaged in the Mahayana but have forgotten the spirit of enlightenment. So do not instruct them in the disciple-vehicle. The disciple-vehicle is not ultimately valid, and you disciples are like men blind from birth, in regard to recognition of the degrees of the spiritual faculties of living beings."

[END OF QUOTE]

(It does seem to me that you break this rule though - we often seem to reset to talking about The Common Ground as if one of us doesn't get it.)

I have it. In your language what you call "Common Ground" is just a stuck thought.

We are not seriously going to start discussing the phrase "Common Ground" when that phrase came from a discussion about there not being any suitable phrases so might as well just pick one like "Common Ground", are we?

It's not a "stuck thought" for me, although that is a good way to describe it when someone actually has a conception of the 'truth' that they attend to as fact, rather than a pointer to fact.

Is what you're pointing to a phenomenon (an experience)?

No. When experiences are dissolved, it is that-which-isn't-coloured-by-experience-anymore (it's not even "left", strictly speaking).

Potential is that which you know but don't experience... You've been saying "describe experience" like once or twice recently

I should be clear that by "experience" I mean it in its broadest sense. Not sights, sounds, and so on. "Knowing" is included too.

My problem with the "infinite potential" thing is that you can't know infinite potential as such. I can know potential from here, but not infinite potential. As with the "background" thing, to speak is to say too much: it is openness, a lack of limitation.

Non-production means whatever is manifest it manifests only 99.999% and never 100%. And non-destruction means whatever vanishes, it doesn't vanish to 0%, but vanishes to 0.0001%.

Whatever is "destroyed" (or dissolved) never truly vanishes, I agree. Memory, in its broadest sense, always persists. There is always a trace of existence. I disagree with the other, though. Unless you can answer me: What is 0.001% of infinity? Better to say: 100% of what manifests (as knowledge or experience) is manifest. What is not manifest (as knowledge or experience) simply cannot be spoken of.

Oh, I can do it in so many ways.

All good phrasings! Although maybe "God in whole and in part". Excellent.

So, given that intellectual understanding, how does you describe how to absorb it as a belief, and utilise it to change one's world?

My Spin

All is awareness. Awareness is neither form nor formless, it is simply aware. This is what you truly are.

Experiences are patterns arising in awareness. Experiences leave traces (via inertia / memory effect) in awareness. Those traces in-form subsequent experiences, and so on. This process is passive (although the creation of inertia was not necessarily). This is equivalent to the formation of habit and stability; this is equivalent to belief and expectation. These constitute the "facts of your world". To change your experiences, therefore, you must adjust or insert facts. This is equivalent to adopting new beliefs. It is not sufficient to generate thoughts-about these facts, you must viscerally know them to be absolutely true. This is done by "Active Assertion" of those facts; by becoming a world in which they are true. The whole structure of the universe is present right now, enfolded into awareness and directly accessible in the form of your "felt-sense" of the world. This process is greatly assisted by ceasing to identify with the content of experience, adopting a state of complete allowing. Identifying with an aspect of experience is equivalent to "holding on" to that pattern. At a minimum, this will result in resistance to change; at worst it will re-assert the existing pattern and entrench it further.

(Obviously skipping over some steps and detail here.)

Your Spin

Pretty similar, although probably differ in the approach details.

I tend to skip the contemplation and try to go directly for the target by assertion. Hence, say, that Overwriting Yourself exercise. The visceral aspect is important in my approach, because that is aligning your direct-knowing rather than just your thinking-about.

Couple of questions:

- How do you tell when beliefs have shifted? By experiences seeming more in line with your contemplations?
- After that, how do you approach making more direct, manifestation-like changes?

Great, here we go:

If all is awareness, what about the unconscious content that's below the level of awareness?

This is why we need to be careful. Awareness's only property is being aware. However, that doesn't mean everything is perceived as an image, sound, feeling all the time. So called "unconscious content" is with you right now, enfolded as the felt-sense.

If all is awareness, and you describe awareness as a mostly passive process, why do you suddenly talk about fact insertion? What is the non-passive element that allows for something as creative and imaginative as fact insertion? You jump to fact insertion without introducing that element explicitly.

I presented the connection between experience-memory-experience first, because it establishes how habits of experience are formed. Then I move on to inserting facts. In a longer description, I'd have talked more about "intention" and then linked that to modifying the felt-sense or particular components of it. That would be the step between the two. Also explore the difference between creating one-off experiences (single event fact) and creating habits (more general facts), and how even thinking repeatedly about something does establish an element of habit. Of course, the "passive" mode is actually the result of a previous creation, but it can be easier to say "here is the simplest rule of the world" and then "here is how we use that". Because realistically, most people don't want to remove the memory effect, they want to leverage it.

How can facts be inserted? Are facts mental fabrications to begin with? In this case they can be inserted, but also, in this same case facts aren't actually factual because they'd be subjective...

"Fact insertion" is basically the name for fully becoming a particular fact, taking an idea and making it true. It's the difference between thinking-about and directly-being. Of course, we're operating on the assumption that everything (all there is) is subjective. In this sense, fact insertion is really a change of location, from over here (apparent internal) to over there (apparent external) in the long run. Practically speaking, it's the transformation from an idea into the felt-sense, which will subsequently manifest 'over there' depending on the factual details.

If the universe is only a manifest set of coherent facts, this leaves out latent potential (a set of all possible alternative facts) which would then have to be outside the universe? Seems clumsy.

The latent isn't existent until it is conceived of, in this description. Possibilities are infinite, but they're not just sat there in a big list waiting to be read. It can be visualised that way, but there is not a pre-made grid of all possible configurations - unless you go looking for such a thing, perhaps. By "universe" - actually, it's better just to say "world". And world is the set of active facts and also memories. The felt-sense is the world in its entirety - non-local and non-temporal.

If I were to say something similar, I'd say the manifest (which you call 'the universe') and the latent potential are directly present in your own mind. This second half would be important to mention.

I'd go with that, so long as the 'latent potential' isn't seen as pre-made (we could argue this point I guess). I see it more like a creative ability, generative rather than prescriptive. That's how it seems anyway.

To me it sounds like you don't understand the nature of contemplation if you think you can skip it.

In the context of my original comment, I was trying to get at the idea that you don't have to individually uncover and dissolve your beliefs necessarily, if you find you can instead assert a new fact and have it become accepted truth. (If that doesn't work of course, then you have to feel out why.)

Obviously, contemplation is what leads us to be able to say the above in the first place! It's just not necessarily a required component for individual manifestations/whatever.

This in my way of thinking is the second leg of the two legged system: contemplation and meditation. Meditation is precisely adjusting of the facts in my view. Because what I describe as "meditation" is an active, magickal process and not just sitting around like a dead vegetable.

Right. Really I'm just implicitly saying that I'm talking about the second leg, and the first leg was completed 'some time ago' (or you've accepted someone else's conclusions on faith). But with some first leg mixed in - because if there is some dissolving going on while you assert, because if there is resistance and it then fades, you have basically been doing a meditation/dissolving on a limited belief without necessarily deciding to in advance.

Yes, but also by intuition, which you call "felt-sense" which is a very nice term in my view.

Yes. It's basically "knowing".

I contemplate the qualities of will. After a long time of this, I realize that will is always ever-successful in all its ultimate aims....

Right, that was really good. And your notion of "obstacles" is the resistance the felt-sense gives as resistance - contrary facts. Which may or may not be addressed.

In fact contemplation of the nature of the will can be said to dissolve the obstacle of the felt-sense that will is limited in scope and can only legitimately intend a certain narrow class of transformations instead of all conceivable ones.

Yes. One can insert a meta-fact (actually this must happen to some degree) of the notion that "this is a dream-like world and my Will always operates successfully" or somesuch.

Assertion: "It is a fact that facts of the world can be altered simply by assertion!"

Well, I'm so pleased my existence is approved! ;-) Well, the point of this is to have a discussion, to improve all our efforts.

Yes, belief is what dictates what you experience as the world - which includes the thoughts and actions you experience "doing", plus the forms and events which arise in the "environment".

It would be you redefining for others what was meant by the word "belief", right? The thing-in-itself is left untouched of course. They seem to be the same thing, but I like your phrasing. Pointing out a misconception, which changes the idea, or understanding, that the word points to. "Redefining" could be misconstrued as changing the definition without re-pointing to a particular aspect of reality.

I don't want to discard my reasoning ability. I want to leverage it. This is why contemplation is important. Contemplation synchronizes reasoning with experience,

That's fine, nothing against that. I'm all for the intellectual approach. It provides ideas, new avenues, which can all be applied or used as targets. And, y'know, it's all about personal preference too.

"Really I'm just implicitly saying that I'm talking about the second leg, and the first leg was completed 'some time ago' (or you've accepted someone else's conclusions on faith)."

Again this tendency surfaces. It's your tendency to think linearly in a step-by-step fashion...

Here you're off base. In that paragraph, I'm talking about 'making the change'. How you've come to decide to make a certain change, well that's a matter of preference or past contemplation - whatever. Also, assertion highlights any counter-view you might have against your target, so it can be dissolved at that moment, rather than before. It's a matter of preference really.

A lot of these processes run in parallel. Your contemplation may lead or your magickal transformation may be outpacing your contemplation, but these various processes of transformation of mentality run concurrently and non-linearly.

Sure. But it's easier to talk about things one at a time. It's like flying a helicopter: you've got multiple controls, and changing any one setting affects the others, so you're constantly shifting between approaches.

Yes! But I like how you say "felt-sense" because "knowing" is slightly washed out

Yeah, "knowing" has become fairly meaningless. And by "felt-sense" I mean something very specific.

Now, some time ago you were saying potential doesn't actually exist. It's time to remember what you said about the subtle aspect of awareness.

Potential as a 'pre-made path', yes. As a structure it isn't already there. Of course, awareness itself is infinite potential, infinite creativity. So anything could happen, is possible.

Nothing can ever be missing from latent potential such that it'd need to be added later on.

Right. Because awareness could take on absolutely any pattern at any time. I enjoyed your 99.9% computer screen imagery!

... you think decision is an event in time...

The decision is experienced as an event in time; the result or 'inserted fact' is true forever in all directions. "Decision" is just a name I'm giving to adjusting a fact of reality in this case. In effect, it becomes timeless itself because the decision does not persist, only the deciding.

Sure, but you don't have to give an impression, repeatedly, that they actually happen one at a time.

I wouldn't have thought you would have ended up with such an impression.

However, pre-made paths do exist to some small extent as potential. I call those "destinies."

Hmm. Okay, so your idea of "destiny" would in my approach be the inserting of a fact dated for the future ("Next Thursday I will discover a yacht") or just a general ongoing fact of the world ("I am a discoverer of yachts"). In both cases the fact is true now, because it is timeless, even though the corresponding experiences may apparently lie in the future.

"As a structure it isn't already there."

All possible structures exist as all-potential. Potential refers to all cognizables that are cognizable in principle. Since structure is something that we can cognize, yes, it's part of potential.

I still disagree with this. Perhaps I am misunderstanding, but it conjures up for me an image of a whole set of possibilities - options, from which a choice is made. I do not think those options exist prior to us asking for them; they arise 'creatively' and cannot be predicted. That is from experience (apparent). There is no pre-made map of the territory. Am I misunderstanding you?

(Practically speaking, I don't think it makes a difference, so long as their is no apparent limit to the possibilities in effect.)

So they are potential, but also pre-made in a sense, since they are preferentially elevated from other possible experiences that also lie in potential.

Neville Goddard would describe this as setting up a new deterministic path - but one that you could reshape, redetermine, at any point. Deterministic, but not fatalistic.

Oh, yea, they do exist prior to us asking for them.

In what sense do you think they exist prior to asking? (I am not thinking of a coherent and cohesive space.)

It works because all possible assumptions exist in seed form. When you water them with your resolve and attention, they spout.

Clumsy. How did all these "seeds" come to be? It is not required. By starting to act as if something is true, you have implied a fact, created a belief, and that is the seed, the pattern, which shapes ongoing experience. The more interesting question is: How did you get the idea for that particular "something"? Where did that idea come from?

Your final answer is the answer for "potential" too:

Potential is the potential for anything, not specific things. Potential isn't a thing, it's the absence of a thing: the absence of perimeters and limitations.

Potential isn't a set of things as you imagine. It isn't a set of pots, rather, it's a set of all types of curves, shines, volumes, etc. And it's infinite. It isn't things, but all things exist in it as well. But if you just see things in it, that's wrong. Potential that has only things and nothing else is incomplete.

Doesn't sound like a very useful description. In what sense is any of that actually experienced?

Q: For example, you see a cup on the table, but the cup could be somewhere else too, but isn't. And yet this sense that it could be somewhere else but isn't is integral to your perception of the cup relative to everything else. This is near potential, which is very easy to talk about, but most people don't think about it. Far potential is harder. Look at your experience now. You have a sense of tomorrow even though it hasn't happened yet. But there is a felt-sense that tomorrow is "out there", definitely coming. That too is potential. Near potential. Consider what it means for cognition to change. First what is cognition? If you start with something small, like a cup, what is it? What's implied in it? Spacial parameters, colors, sound, taste if you should be crazy enough to bite off its ceramic, a sense of resistance when touched, a history of how it came about, like if it's a ceramic cup, then this implies clay, and clay implies Earth, and so on. These contexts sprawl infinitely. If you follow them up first you navigate all the conventional and easy to understand stuff, but eventually you get into weirdness. For example, because all cognition is optional, we can conclude that the orderly sense we get from time can be replaced by a disorderly one. That's weird. And yet we know what is orderly because we know what is disorderly. Even if you don't experience any disorder for 3 long aeons, you need that knowledge to cognize order. It's like you know what light is because you know what dark is, and vice versa. So if you were in a perfectly dark room for 3 long aeons, you'd be able to cognize it as dark, dark, dark, for 3 long aeons, without the tiniest ray of light anywhere. This is possible because you know about the potential of light. So without light actually being present, just your knowledge of potential shapes the cognition you have. Cognitions are infinite, limitless. They include familiar things and unfamiliar. Orderly and disorderly. Contemplate what infinity means. For one thing, it means if you can conceive of it, it's there, included. And it also means your ability to conceive of things will never match infinity, because you conceive only via near potential, never far. You can see just a little bit beyond the horizon of what's familiar. That's all still near potential. Far potential is unknown, and even that unknown is needed to cognize and give shape to the known.

Edit: I forgot to explain change. Basically cognition is hard to separate into parts, but one arbitrary way we could think of it is as a moment in time. One cognition one moment. So each cognition is a snapshot of the known universe. How can it change? In fact, if it doesn't change, how can this be cognized? If something appears not to change, it means you have to know it can change, and yet it doesn't. This knowing what could be but isn't, is knowledge of potential, which is needed to experience change or constancy.

Interesting description.

Isn't this a subtle form of "belief"? In the sense that, what you have described isn't infinite possibility, so much as possibility implied by current and previous experience".

Cognition and parts: I guess there are no "parts" really, as there are no "moments" or "relationships", fundamentally - but one step up from that, there are relative parts and therefore relative positions, relationships. Without the (apparent) division, there can be no conception of difference, of change.

Going further: without the knowledge of unity, we wouldn't cognize division, but without the knowledge of division we wouldn't cognize unity.

Is unity really the opposite of division? Perhaps. But "unity" still implies an object, with edges. If all division ceases, what remains is not unity. Not-unity.

EDIT: And meant to say, you have described the experience of enfolded possibility, but not indicated how or if you can experience infinite possibility. You are just saying it is so, without evidence.

I think unity implies an opposite and I think it is still a subtle object. How could delineations ever be soften to the extent that objects disappear? It's a bit Zeno.

You can't experience it, but you still know it at all times. It's not obvious because it's the background against which apparent things acquire their meanings.

Right. Infinite possibility just means there is no underlying constraining structure. It is not a set of possibilities, infinite or otherwise - it is an absence of impossibilities, which is different. I don't think divisions turn into unity; they just dissolve as divisions, leaving the background. g'Night!

"Infinite possibility just means there is no underlying constraining structure." That's part of it. It also means infinite capability. Infinite potential has a positive meaning, and not just negative.

But it does matter that we define it in one direction and not an other. We might just say "absolute freedom" and dodge the whole issue. But if we understand "infinite potential" as being creation-to, rather than selection-from, then all is well.

When divisions dissolve background is not something that's left over, and I think you know why not. I hope. I know this point experientially and intellectually.

Haha, I knew when I typed that word that you'd pick up on it. Sloppy terminology from me! The Common Ground. But not "unity". Maybe we need a symbol. Like what Prince did.

You can't create-to something that isn't available for that purpose.

We should keep the levels right here. Actually, I think we wrapped this up previously and I just mis-phrased? My bad. Selection-from the opportunities implied by present experience and creation-to them. I've lost the thread, but I think my original point was that there's not some vast list out there of possible futures that we choose from; however the moment implies possibilities and overall they are not numerical constrained, so our views join up in the end.

The ground is in some sense the mind itself, however the mind isn't like Earth...

Yeah, "The Common Ground" doesn't mean "ground" in the way of "platform" or "earth". As I think we already discussed, it simply fulfils the need to have a phrase that basically doesn't say anything about that-which-cannot-have-anything-said-about-it. Not unity, not division, not this, not that, and yet all this and all that, etc, etc. So long as we understand what each other (doesn't) mean, all is well.

You don't understand what infinity means.

I do. And, effectively, it means the same as being undefined in this case. Infinite degrees of freedom is just freedom.

Nothing is missing or absent from "just freedom."

Quite so. It has no degrees, for degrees are limitation. The word becomes meaningless. (This is fun, but we both know what we mean I think.)

It has all possible degrees and all possible limitations. If it had no limitations -- that would be a limitation. In fact, limitlessness isn't absence of limitations, but your ability to choose your own limitations. And we're choosing them from an infinite pool.

How many sectors in a circle?

Infinity.

How much space in a circle?

As much or as little as you like.

How so?

Well, how big is your chair? If it's tiny, you can put lots of them in that circle. If it's huge, then not even one. If pay most of your attention to what's outside the circle, the circle is not even a dot, it's invisible. If you narrow your attention to what's inside the circle, you may not even be aware of its perimeter, thus again, the circle vanishes.

But that's using "chair" as a unit of measurement, surely.
Space is "uncountable".

If you say space is uncountable, it's like space is prohibiting counting. Space accommodates counting, but it's not restricted to any specific set of counting methods.

Space isn't doing anything (and by this I'm meaning the example of the space within the circle). You can count other things across a distance, but you can't count space itself. I can count the number of wooden metre sticks which bridge the gap between one side of the circle and another - but that's me counting metre sticks, not space. Actually, you can't count the extent of any object. You can only count the number of other objects adjacent to it.

Counting is pretty arbitrary. Since there is no strict requirement for it, you can do it whenever and whatever.

Man, you're one of those free-counters, aren't you! The counting equivalent of those Yosemite boys. We've drifted off topic really; my fault. I think the original point was going to be something along the lines of discussing the process of bringing things into "objectdom", but I've lost the thread now.

Healing:

I'd be interested to hear your take on that. Some people - here - seem to be all about trying to actually interact with "cells" and so on. Others just do a broader intention for the result, rather than trying to engage with the problem in detail. Traditions like Ho’oponopono treat the outer world as reflections of our inner selves. So if you want to heal a hospital full of mental patients, you sit back in your office and contemplate what aspects of yourself they represent - heal thyself!. Which is a bit more like subjective idealism.

State of Zero

After Simeona’s passing in 1992, her former student and administrator Ihaleakala Hew Len, co-authored a book with Joe Vitale called Zero Limits referring to Simeona's ho’oponopono teachings. Len makes no claim to be a kahuna. In contrast to Simeona's teachings, the book brings the new idea that the main objective of ho’oponopono is getting to "the state of Zero, where we would have zero limits. No memories. No identity."
To reach this state, which Len called 'Self-I-Dentity', one has to repeat constantly, according to Joe Vitale's interpretation, the mantra, "I love you. I'm sorry. Please forgive me. Thank you." It is based on Len's idea of 100% responsibility,taking responsibility for everyone's actions (once again according to Joe Vitale's interpretation), not only for one's own. If one would take complete responsibility for one's life, then everything one sees, hears, tastes, touches, or in any way experiences would be one's responsibility because it is in one's life. The problem would not be with our external reality, it would be with ourselves.
To change our reality, we would have to change ourselves. Total Responsibility, according to Hew Len, advocates that everything exists as a projection from inside the human being. As such, it is similar to the philosophy of solipsism, but differs in that it does not deny the reality of the consciousness of others. Instead, it views all consciousness as part of the whole, so using parts of the idea of holism: any error that a person clears in their own consciousness should be cleared for everyone.
-- Wikipedia. Related book: Zero Limits, Joe Vitale

I've got a couple of things to write up - Problems Solve Themselves and Magick is Memory - but just not had much time to think them through and type 'em out.

Meanwhile I re-read a Philip K Dick short story the other day (I know you love him) and it has a nice metaphor for reality editing (posted it here).

In the story, the main character discovers a punched paper tape loop inside him. Experimenting with adjusting it, he finds that changing the pattern changes his external reality. The punched paper holes are akin to the memory structures of our minds. Tape over the hole (memory of belief) associated with chairs, then they'd not only be uncountable, they would be un-anything.

It's quite a good story for introduction people to the idea: what if editing ourselves edits the world?

...

[QUOTE]

The Buddha said, "Noble sons, a buddha-field of bodhisattvas is a field of living beings. Why so? A bodhisattva embraces a buddha-field to the same extent that he causes the development of living beings. He embraces a buddha-field to the same extent that living beings become disciplined. He embraces a buddha-field to the same extent that, through entrance into a buddha-field, living beings are introduced to the buddha-gnosis. He embraces a buddha-field to the same extent that, through entrance into that buddha-field, living beings increase their holy spiritual faculties. Why so? Noble son, a buddha-field of bodhisattvas springs from the aims of living beings. "For example, Ratnakara, should one wish to build in empty space, one might go ahead in spite of the fact that it is not possible to build or to adorn anything in empty space. In just the same way, should a bodhisattva, who knows full well that all things are like empty space, wish to build a buddha-field in order to develop living beings, he might go ahead, in spite of the fact that it is not possible to build or to adorn a buddha-field in empty space.

[END OF QUOTE]

Well, it was worth our tail-end discussion after all, then. Yeah, I'm getting bored of agreement. Need to stirs things up again soon. Gonna find me some outrageous beliefs for next time which are completely unsupportable - and yet I shall. All politicians must be Tibetan monks in disguise then. They seem to be able to justify anything - and then justify the opposite a month later. We can be quite good at coming up with justification for what we want to do, for instance, even if the argument for doing it is itself nonsense. Choose an end point, find a path to it. That's basically what politicians do as a job.

Additional thoughts from earlier:

Is the final state of the mage the non-mage, or "magelessness"?

To be completely flexible, we have to let go of all patterns, all content. No structure, no memory (in the sense of habits), no beliefs. Those correspond to resistance. Only when there is no resistance encountered at all to intention or decision or desire will we have reached the ideal state. (We've touched a little on this before earlier in the thread of course.)

However, when we reach that state, of complete effortlessness, there would be no gap between wanting and getting. There would just be having. So does the idea of manifesting or manipulating the world - having power - even mean anything anymore at that stage? It would be a world completely aligned with your desires. There would be no 'magick' to be done. You would simply be receiving, with no asking required.

Being insistent on consistently letting go is not flexibility. That's renunciatory purism. Flexibility is when you let go or not, depending on what's wise. Just my 2c.

I don't mean it in hard-line way. We are free to adopt or dismiss patterns as we wish! I mean it more as the most reduced state, structurally and habitually, the apparent world could become. After a while, the first thing you'd do is re-introduce some structure again.

Thinking that mages manipulate things to get stuff is so materialistic. How about dancing.

Getting stuff is materialistic, having experiences with stuff less so. If we are about the experiences, then we are "dancing with yachts" rather than owning them. And I agree with your "art" comment. Magick should be "play" as well as "purpose".

Well, to the extent we're mired in conventionality our magick will not always be art. For example, if I have a disease I want to heal, that's not art. That's very utilitarian. There is no shame in that because I am not yet resolved to live as a perfect being.

Yes, that's why I said "as well as purpose". Because while there can always be an art aspect, sometimes there's just stuff that needs sorting.

Yes. Sometimes when I agree, I don't say I agree, but I just write a blurb that almost restates the same thing you said in my own words. It just means I agree.

Agreed.

...

Q: Sure, I accept everything you say as being true. But I also happen to believe that our minds and 'forcing' things have little to do with it. An experience is happening. It was happening just fine when we were small and our minds were just starting to develop. Our minds then were not shaping the experience but a result of the experience. Decisions certainly were being made, but not at the level of the mind. I see that as mostly being true even now. I don't see the manifestation you describe as something we can "do". Rather I see it as getting the mind "out of the way" so that it does not "interfere" with our "greater intent". That is "alignment". Anyway, when you talk motivations and manifestations, it is important to keep in mind what purpose and context they serve. That will define the boundaries and limitations.

Are you referring to "God's Will" here?

What is the nature of our "greater intent"? Is it some pre-birth intention by which we set ourselves in motion, but do not recall?

In that case, any direct interference we indulge in now would mean pushing against our own chosen purpose, our original desire. Instead of "asking" mode, we should rest in "receive" mode.

Q: I believe we grow in two phases. the first is to expand our imagination (everything is imagination) and the second phase is to turn that expansion into a stable reality experience. This cycle repeats forever, or as long as the desire for "experience" remains. We have intent, everything we are a part of has intent, existence has intent. The question is which intent are we trying to fulfill? Are we being who we are, or who our environment wants us to be? Both are valid types of experiences.

And, on intent, are we free to intend absolutely anything - both aligned with our selves or not - and those intentions have equal power?

In the context of "all realities exist" power would be the ability to to bring about a specific reality experience - reality selection.

Yes. So the question would be, is there something special about our original state/path, or are we free to change ourselves (beliefs) as we like, and adopt any path. Do we have a "destiny" at all, other than the intentions or end-points we set for ourselves?

what we "claim" are beliefs are also thought patterns that arise

Well, I agree with this - the word "belief" gets somewhat misused, perhaps. I see beliefs as the way you mind is structured at that moment. Thoughts that arise and events that occur will tend to be in alignment with those "beliefs" (structurings of mind). I see these structures as a feedback loop. Experiences arise (events and thoughts) which leave traces which in turn seed experiences, on forever and stabilising. Unless we use intention to change this, either indirectly (choosing experiences or creating thoughts which leave traces, changing your world gradually) or directly (amending the traces themselves, changing your world dramatically as a one-off event or a new general rule).

Often people talk of one's "True Nature" as a special thing. Are we born with a base structure that gets polluted over time? Or is there really no such base structure? The idea that we can adjust our beliefs suggests we can do anything. Although... we do have a base structure of "being a human, from these parents and in this environment".

The things we want to "learn" are desires we have that conflict directly with this resistance. The learning process is not about the achievement of a goal but in overcoming resistance.

That's a nice way to think of it. I am fond of the idea that desires are just parts of our nature that we have a resistance against, and so are not yet manifest in our experience. (Nobody ever had a desire for something they were already experiencing...)

...

Don't confuse manifestations as existing separately.

Hmm, I don't. I say "in whole and in part" because, like it or not, we might be the whole, but we also simultaneously experience (the illusion of) being a part of the whole. That's why constantly telling people "they are God" doesn't help them very much. "Great! I accept it! But how come I'm still little me?"

Yes, all there is is mind, and all appears within it, with no fundamental division or separation. And you can directly experience this. But most people don't, and wouldn't see how to, because in experience it seems obvious we are separate, until we investigate it in a certain way or make the change deliberately.

To be honest, I don't think we have much to reveal to each other in terms of "the basic understanding", only wording - how we phrase things among ourselves, and how we explain it to others. But it's pretty apparent that this leads us to the "two truths", where using one view in a discussion based on the other is like saying something that is true but sounds false, or vice versa. I kinda hoped to uncover a way to join the two.

EDIT: The context of that discussion was about the wording, rather than the understanding, in other words.

Lots to explore in terms of what that means for life, in meaning and practice though. Hence "practical" exercises are something I'm keen on. I'm coming to think that the "right wording" is often the phrasing that leaves something out or doesn't quite line up - thereby revealing a gap through which the plummet into the abyss is revealed. So to speak!

Logical structures are castles in the sky, perhaps: they consist of organised pathways we can wander round, seeking to understand the basis of reality, but you actually have to jump off the track to experience the true underlying. To lead someone to understanding, you might have to give them a nudge, or place them on a path that goes nowhere, terminating in mid-air...

A good example is the whole "objects are transparent" insight - that sights and sounds float in awareness, but also are awareness, which means they aren't really any-thing. In words, each description misleads and excludes the other - only by leading to the gap between descriptions, to the experience it points to, can the meaning be truly grasped. (i.e. The meaning must be experienced, known directly, rather than thought-about.)

You're not wrong, and I suspect this has been known for a very long time. It seems to be the basic principle behind the koan, or the finger-and-the-moon, and there's even the likes of this as far back as the Vedas.

Agreed. That's the origin of the "two truths", etc, I think. I

It's only when you try to work around the language yourself that it becomes clear how potentially insurmountable it is. You can "feel-know" it and its complete simplicity, but you can't tell anyone who doesn't already know... because it won't make logical sense and they'll just think about it.

...

I like the idea of a package word. I view it ("you") as problematic in that it implies a 'perimeter' which does not actually exist - but all words do this, whether spatially (nouns) or temporally (verbs).

POST: Thinking again about the concept of "Lucidity".

[POST]

I think i have come to a point where i am no longer interested in philosophical and logical debates between idealism versus materialism. This is mainly because i don't think this debate will ever end, and me pontificating upon it is nothing more than a samsaric oroboric cycle. The capacity for the imagination is infinite, and i realized the idea of trying to achieve lucidity by disproving materialism by argument is a waste of time. This is because no matter how good or solid an argument i cant make, the materialist can always dive into his imagination and counter it, and i can counter whatever the materialist throws at me, because of the depths of imagination. I dont mean to sound egotistical here, but besides all the philosophical back and forths, i think what really makes me a subjective idealist or makes me feel lucid is just seeing existence from a different vantage point. In other words lucidity is a certain awareness of awareness that i don't think everybody has yet or ever will. I mean say i was in a non lucid dream arguing with a dream character about whether or not this was or was not a dream. We could argue endlessly about it, and i could convince the dream character he is wrong, but i have realized having a solid philosophical framework for subjective idealism is not enough to achieve lucidity. Lucidity is a direct intuitive knowing of the dreamlike nature of things, an actual sense of perception and not just a convincing theory. I'm certain now that the reason you cant convince most materialists is not just because they have a bias reinforced by eloquent mental gymnastics, they simply lack this type of perception. Trying to describe the non material nature of consciousness to a materialist is like trying to describe the nature of orangeness to a colorblind person. They just cant see it or feel it. And this is not simply wishful thinking in the sense that it feels good to think of the universe as a dream or a kind of faith, its just being a fish who has seen dry land and trying to explain it to other fish that haven't been above the surface. Language isn't adequate, experience is the key, just like you cant know what its like to trip on a hallucinogen by reading about it, you have to actually do it. Its getting over that seduction of the drug "being right and the other person being wrong" that western civilization tantalizes with us. I've also come to realize subjective idealism creates a very different kind of epistemology. Rather than materialist living in an idealistic universe delusional thinking materialism is true, instead materialists live in a materialist dream within a deeper dreamlike universe, and there is technically nothing wrong about that in that it is just one part of the geography of the ideaverse, we have just become lucid and are trying to escape it, creating our own dream worlds rather than being stuck in someone else s.

[END OF POST]

Your point on the infinite depth of imagination and its connection to this is great. If our thoughts and our world are one and the same, and our world works according to something like this:

Make a decision that something is true, go looking for evidence that it is true, and you will discover that it is true (for you)
-- *TriumphantGeorge*

Well, then there is nothing to be done. Until a materialist decides and commits to becoming - or exploring being - an idealist, to having an idealist experience, then he will remain a materialist. His world will back him up with the corresponding materialist experiences and thoughts and logical reasoning. It is not really possible to describe the nature of idealist reality in anything but quite imprecise metaphors, and those metaphors are only meaningful if you have had the direct experience. Unfortunately, having the direct experience requires a prior commitment to it, a commitment that logic alone cannot induce - so it's circular. Hence the idea of providing exercises and thought experiments that are experiential rather than logical - just-deciding, switching off your senses, overwriting yourself, and so on. It's a way to short circuit all that thinking-about.

POST: Mechanics of Manifestation from the No-Self Perspective

But if you just say "whatever happens is what you want" then you'll be left following appearances and never being able to challenge what you see.

Can I pick up on a couple of things?

What do we mean by "want"? Our man obviously never really wanted to be paralysed in an "ego" sense. Ask him, he'd say "no thanks, operational legs are cool!"

So, what is the nature of this wanting? Do we not just mean the direction of the flow of life, if it were unobstructed? Obstructing a path leads to "alternative methods". For instance, perhaps he didn't want to be a performer anymore, however he resisted the opportunities that presented themselves, and so it came to extremes. He didn't want to be paralysed as such; he wanted the eventual outcome and temporary paralysis was the path that resulted.

Meanwhile, on will and possibility. Why do you find it difficult to accept, say, putting your hand through a wall? Have you had any progress in getting yourself to expand out your presence, overwrite your boundary yet - or do you still find that exposure/fear response getting in the way?

EDIT: Hey, wait a minute... what's this?

because the manifest appearance is in some sense a shadow of the past wants

I'd go with this. There's always traces. The "past" is a tricky word though, because of the presence of all time as contributor, but we can ignore that mostly.

There are times when being content is the wrong attitude.

I don't read it as "being content", as in wanting to stay in your current state forever. It's sort of the opposite. That were you to remove all obstructions then what you want would come to pass. Because you obstruct, then you end up with things you don't really want, temporarily, as a means of forcing you towards what you want. I guess it ties into your idea of "being ready to pay the penalty". You are always on the way to getting what you desire (I think), but if you obstruct the path to that, you'll get nasty side-effects as your world tries to force its way to that configuration, by working around your "held patterns".

Nah, it's not that shallow.

Yeah, just a plausible description to illustrate my point, you get the idea though. That he might have accidentally created his paralysis situation, because he wasn't consciously managing himself / his world.

I know why but I don't want to talk about it now.

Nah, not about the why - was just wondering if you'd made progress, since I was writing up something on it (overwriting yourself, deleting boundaries) and if you'd had something to report, it might have been interesting to me.

LOL, progress in my life is something that's measured in decades. It's not an hour by hour thing.

What? How do you find so much to post about then? ;-)

I have a very active contemplation life. My experience changes slowly. I can experience this or that peak experience, but that's not what I regard as change. Those peak experiences are like temporary blips. Change is slow, gradual and lasting.

A good point about peak experiences. People go seeking for these, but I think that - apart from perhaps knocking someone out of their complacency and showing there's something more going on - they can be a distraction from real change.

Please don't confuse me for someone who poo-poops or warns people against peak experiences. I am not like that at all. In fact I've given out many instructions on how to enter into a peak experience.

I think they are a distraction if they become a pursuit. Interesting about the Buddhist perspective you describe.

It's critical, whether you avoid meditative absorptions or not, to not have fear and revulsion toward them.

I think they can be enjoyed for what they are. To meditate in order to seek enlightenment, say, is folly. To do it because it's enjoyable, or to gain an experience, that's fine, or a flash of insight, whatever.

Peak experiences, by their nature, are "peak" and so you don't learn how to rest in that state in general, if that is your aim. So people who dedicate themselves entirely to peak-seeking can be missing out, setting themselves up for 20 years of retrospective disappointment, when they could be more direct and start having it now.

What do you think a 3 year dark retreat is, for example?

I think it's a process of relaxation.

Maybe the problem here is the word "peak". By definition, peak experiences are transitory, but can offer temporary insight. This is what some people get from meditation (mantra until thoughts cease and they can see the background; one-pointed until exhaustion and attention opens out). For the general state, perhaps we can say "optimum" or "highest" or "expansive" or "relaxed as awareness" - or whatever. Something that doesn't seem to involve force.

Transitory experiences leave lasting marks. Also consciously induced transitory experience should be distinguished from those which arise unconsciously. A consciously induced transitory experience potentially establishes or firms up a commitment, potentially a new one, and that's important.

Obviously I don't mean relaxation as in chilling out - it's in the proper sense, of releasing into a more optimum, sustainable state. Of course, consciously pursuing a state can establish new patterns. Or more importantly: delete them!

The word "temporary" is probably clearer, then. But we know what we mean.

The word "temporary" is probably clearer, then. But we know what we mean.

"Peak" is a relative term.

Yeah, I just think that "relaxing into the valley" is more what it feels like, in terms of effort. But equally if you approach it energetically to write the plateau, you'll find the valley and the plateau are in fact the same place. Either/or. What's important is that the final state doesn't require maintenance or energy - it is stable and effortless.

This is why it's best not to poo-poo peak experience, or at minimum, be extra extra careful in how and what exactly you poo-poo so as not to confuse anyone.

People have wasted their whole lives meditating intensely to recapture that "calm, oneness" moment they had years ago, confusing the experience with enlightenment. But enlightenment isn't an experience, it's a state. You can't maintain an experience. And a forced experience can't be turned into a state. That doesn't poo-poo peak experiences - they can be a source of great insight and wisdom. But so can Reddit sometimes. You don't want to try to spend your whole life there though, in the hope of eventually reaching some experience of non-stop insight. ;-)

Clarifying then: Insight is an event, enlightenment (or being awake, or whatever) is a state. One might inspire you to the other, but should not be confused with the other.

EDIT: Sorry, the method by which you gain one (insight, an experience) should not be assumed to be a method by which you can gain the other (a stable state).

Of course relaxing only 5 minutes at a time is an excruciatingly slow way to lower your base level of tension. That's true. And if your relaxation times are also attended by bad conceptual schemes, then your relaxation can even have a counter effect of making you more tense at a base level.

And if what you do between-times is counter, then you are a see-saw. So, the state (this particular one) is something you eventually want to have during daily life. A method that peaks can lead you there, perhaps gradually shift you - but what's important is that the effect persists in some way, when you are not doing the method.

It's about changing your patterns. Your default state (relaxed state?) is what you want to modify and retain. That is the measure of your progress, yes?

Sure. A "distraction" doesn't mean "detrimental" of course - the warning is not that one is to avoid an experience, but to beware of confusing it for something else, for the goal and the method. Enjoy 'em, and be encouraged by them, and get 'em when you like - but remember they aren't necessarily "progress". You make a good point about being wary can cause problems; it can lead to a type of resistance which can really block change. Like trying to do things "right" can be a massive barrier to change.

Are peak experiences really objectively, unquestionably distractions?

Yeah, incomplete sentence/thought: not detrimental to one's path per se. It just doesn't progress if you keep chasing those experiences instead of continuing on the path. It's about taking the experience, but staying on target. Because if an experience is content, then obsessing over it moves you away from the background - the opposite direction from expansiveness. Chasing a pattern is like opening a door in a dream: there's usually a landscape for you to investigate beyond it. Look at a pattern and it'll become more and more detailed, just-in-time to give you more to explore. Forever. But you are not in fact making progress; you are creating, not realising.

And never trying to do the right things is also a massive barrier. :) Isn't that funny?

Haha, good :-)

So either you chase those experiences or you continue on the path? That's the dichotomy?

Oh, you are being picky. The sentence doesn't even say that. I said if you keep chasing those experiences instead of continuing on the path. In the sense that, once you discover that alcohol doesn't make you better at passing your exams, doesn't mean you have to quit drinking. You just don't drink as a study-aid.

What's wrong with adding a little qualification to what you said, you know, the thing in bold?

Uh-huh, it was obvious. As my bolding above demonstrates! You feeling hungover or something? Seem more irritable than usual today. ;-)

(Happy New Year, by the way, hope 2015 is a good one for you.)

What if you just realized you can create?

You are never not creating, so I let's replace "can create" with "are creating". It's the "highest siddhi" as they say. Once you realise, you should probably stop for a bit, take a breath. And then, instead of accidentally creating by implication, scatter gun style - i.e. constantly looking at patterns and, gosh, there's even more detail there - decide to do it consciously, with your new-found understanding. Or not even. :-)

You know what I mean: The method by which (most) peak experiences are achieved is not the method by which ongoing realisation can be maintained.

"Stopping" is no different from anything else. Stopping is still a temporal mental fabrication. Still creating.

That's not what I mean. It's something more like "ceasing interfering". You let what you have created keep rolling on its own momentum (this is of course your own creation, but you are no longer tweaking it). As in, you stop adjusting the patterns.

We're talking about realization. You know, when the person wakes up to the fact that their nature is creative and always has been thus?

So, exactly what I said.

That's something I agree with. I just don't share your attitude toward peak experiences. Which is funny, because I don't even experience that many of them lately, and yet I know should I develop your style of aversion/dismissiveness toward them, I'll just hamstring myself later on.

I think you're reading into what I'm saying incorrectly. It's not an aversion to peak experiences, it's the confusing of peak experiences with achievement on your path. Have 'em, enjoy 'em, if you get insights then use 'em - but don't go looking for them (except for fun).

I don't agree that there is such a sharp dichotomy.

I think we are talking past each other, because these terms encapsulate a lot of different things, and we're not giving examples.

It's something more like "ceasing interfering". That's delusion. That statement objectifies experience. It makes you a stranger to your own experience.

That's just wording. It comes down to a difference we have: You see (as I recall) that creation and experience and intending and deciding are constant ongoing things - constantly active. Whereas I see it as patterns and momentum, unfolding deterministically (if not predictably) until redirected by intention (i.e. patterns and path are reshaped). In your view, there could be no "letting go" or relaxation.

I definitely cannot accept your view, at least not literally.

Perhaps we can take a different tac. Do you beat your heart, or does it beat itself as an ongoing unfolding pattern that has arisen and will fall? In what sense do you "do" your heart-beating? It doesn't seem that you have to maintain it moment by moment; it just happens. However, at any point we could choose to act in a way that stopped that heart. (Although I'd miss ya.)

Is it perhaps you think that, if things are not actively maintained, they will relax immediately into non-existence? This isn't how things work though, from investigation. The more complex the pattern, the more self-supporting it is, the more persistent and the greater the inertia. That's why "letting go" doesn't immediately return you to open space.

There is no relaxation or tension because both relaxation and tensions turn out to be mental fabrications.

Could you talk a bit more about what you mean by "mental fabrications"? I'm not sure what you mean. Where would these fabrications be? Or do you just means that they are structures just like every other structure or pattern in consciousness?

We're muddling things here.

Ultimately, there is no-thing and that is you. That is understood. Any patterns which appear within that, are just what they are: patterns in/of awareness. To call them "fabrications" is redundant, they are patterns of experience, that's that - although within the context of other patterns they also have additional relative meaning. To return to volition, there is no causality between one pattern and another, so there is no need for maintenance. Your "consent" is neither here nor there, because you don't have the power to consent as a person. If you "train yourself" to alter your heart rate, you're really just asserting against the pattern. You are not "doing" anything. It is a fact that patterns given momentum - within the context of the pattern of time and space - will continue until interrupted or compromised. (A sand castle pattern will stand indefinitely, except for the overlapping of patterns called "wind" and "tide".)

You are still talking about "someone's mind" and "my heart", I note. I assume you are talking from the personal perspective there, rather than standing as the background.

"Overlaid": There actually is a bit more to it. There are granularities of structure, but overall there is no solid underlying substrate because there are no permanent things at all, quite right.

I am not muddling anything.

I mean, you and I are muddling, talking at slightly different angles.

Subjective idealism can lean toward realism or anti-realism.

I don't see how, if it is subjective idealism. The book with the whirlpools isn't subjective idealism; it's idealism. Hence it can posit an extended world made of awareness of which "little you" are one folded, spatial section (in the metaphor, anyway), of a "mind at large". Everything is in mind, of mind. Subjective idealism says it's your mind. Of course, the two blend into one after investigation, depending on perspective and dis-identification.

There is no background. If you think there is a background, then again, you're objectifying an aspect of your being.

The background is you and is completely non-object-based - but simultaneously it is of course the foreground. Formlessness/form, all that.

On Angles, Minds, Backgrounds

If you talked at a precisely the same angle as me, you'd be me, right?

I was really using the word "angle" casually, but this is nice. We are all at different angles to the world, and to each other. If two such perspective were to have an identical angle, their experience would be identical in all respects.

Kant believed that even though all we can know is the mind, nonetheless the mind was orchestrated somehow or influenced by things beyond it. So Kant's idealism admits a whiff of objectivity into it.

A whiff of objectivity, from the perspective of the "small mind", in that it suggests that not everything is contained within your experience, right now. I believe everything is included in this room, right now, as it were. Colloquially speaking of course; the room itself is not an actual environment.

But when we say it's your mind, we don't mean it's George's mind. We mean it in a very abstract sense. Just enough to affirm responsibility and to avoid objectifying experience, but no more than that.

Is there a better way we can phrase this? To me, there's no such thing as "George's mind" - there is an idea that occasionally appears called "George" which is quite heavily structured; other ideas and thoughts, even actions, occasionally arise which are consistent with the limits of that "George" idea. But there's no way in which I am "George", except that those ideas and thoughts are appearing in and of me.

Then it can't be called "background" since it isn't to the back of you, or in fact, to the back of anything. It's like remember how you chided me for talking about levels, saying there are no levels?

Yes, it's not "background" in the sense of levels. It's not like having a canvas and then putting paint on it. It's more like a canvas where you form the canvas itself into bumps in the middle. The "foreground" is the bumpy shapes, because they stand out in your attention. The "background" is the un-bumped areas surrounding it, which you tend to ignore.

The word "background" has a connotation of passivity. Are you saying that your ultimate nature is one of passivity?

Hopefully my refreshed imagery counters that. If you "are the canvas" then the so-called "background" is just the infinite expanse which does not currently have a pattern. As the "canvas", you can form into any shape you like. Of course, there will always be more "background" than not, because the canvas goes on forever. Also, missing from this metaphor, is the fact that most of this "canvas" is unstructured - as in, 3-dimensional space itself is a pattern.

I'd say we're at different angles to each other. The way you put it makes it seem like there is an objective world that's neutral to all of us.

Not as intended: Literally, my experience is that I am 'positioned' in the world in one sense - and in a more configurational sense I am 'angled' to other perspectives.

I doubt that my mind can really be called "small." The error in Kant's view is that he reserves an area of mind which belongs to nobody, as it were (or maybe it belongs to God in his view). Thus he objectifies subtly an aspect of his experience.

Berkeley and others do this too. It's because they implicitly use a spatial metaphor. There is no notion, say, of space and time also being structures, patterns in awareness either - so they are left trying to make connections across a fictional gap.

See, I too believe that not everything is consciously obvious in my present experience.

Yes. It's all there. And we seem to agree that the metaphors of levels, hierarchies, dimension, sizes, distances - they are convenient terms to use when getting a particular point across, but they are in no sense 'objectively true'; that is not how things are actually organised. Language is spatial and temporal, so it is understood that temporary compromises have to be made for the purposes of communication.

At the same time, even though you may be different from me, you aren't George, and I am not Nefandi. We may become one and the same perspective in one and the same being. And we may remain as though separate. However, there is no way to establish anything objectively...

Experientially, we can observe that the "place we are looking out from" - if we direct our attentions in the opposite direction - is unstructured, unified. We are looking out from the same place. So in that sense, we are the same.

Can you flip this around? What if we take the bumps to be the background and the unbumped surface to be the foreground? If you can do this instantly, you've preserved your mental flexibility.

Well, I actually do think of this as a bit of a figure/ground image. It reminds me of this, in fact. You can do a similar thing in the room right now: just bring the space between objects into the foreground, making the space the "object" and the objects the "space". (It takes a little practice, that, or it did for me.)

Space is a subtle concept, but really to say that I am a space is too limiting.

Actually, I was trying to be clear there that we are not space - that "space" is another subtle structure that is experienced (and therefore not us). As is "narrative". We can't actually experience what we are, we just are it. Which is why it is, well, of infinite capacity and potential.

I can be said to be outside all things, or even unrelated to things at all, having no definite relationship to things.

Outside of all things, *and yet also all things*.
No relationship to things, *but all relationships between things*.

That's the problem with being God: it's so darned hard to find the words to describe One-self, eh? :-)

It's possible to read something like what you wrote, and come away with the attitude of "well, since nothing we say is exactly correct . . . I like the attitude that comes out this way "well, nothing we say will be exactly correct, still . . .

Right. Now, this isn't a problem for 'informed discussion' - we both know that there is a moon we are "pointing to", as it were. However, without that knowledge it can seem that we're really saying that it's totally arbitrary! It should be striving for the best way to communicate during a particular discussion - picking the best metaphors for the particular point. Which is why dialogue like this is important. Going back and forward, trying different images, until one or a combination of them works (sometimes a combination that is in logical conflict, but overall captures the properties).

"Place we are looking out from"
I don't think I understand this one fully. What are some of the more interesting implications of this?

It's that we can each directly experience that we must all be looking out from the same, um, experience. That "being" thing. Basically: point your finger at your face, follow where it's pointing with your attention to "where you are looking out from", notice the complete structurelessness of it. Everyone has that same "source" in their experience. It's also a quick way of switching to the "background" rather than the "foreground". (Caveats apply to those terms, as discussed.)

We shouldn't try to describe God in terms of a static picture. God cannot be photographed or painted. Instead we should describe God's tendencies, such a tendency toward limitlessness and freedom, a tendency toward playfulness, etc.

Hmm. Never static, and yet always the same. I like the description you used there. Playfulness has always seemed like a great word to use.

On Realism and Not

Okay, that makes things clearer. For me, 'philosophical realism' would be the idea that there is an aspect of reality that exists independent of your perceptions and thoughts about reality. A more 'general realism' would go further and say that what you perceive has a direct correspondence with reality (the version you mean). So it's maybe actually better to go for the negative term you suggest, 'anti-realism', which is unambiguous in saying 'there's no objective reality outside this'. Whether that leads to solipsism or just an admission of non-provability is icing on the cake. Anyway, I've gone meandering there...

For the subjective idealist, what he experiences is reality. There is no behind-the-scenes. There may be regularities in his experience, but they are not "caused" by some external structure - they are their own cause, they are habits. There are no limits, potentially, to what might be true, or how reality might apparently "work", or how things might be structured internally. The subjective idealist recognises the room around him as a floating image, transparent and without solidity - without origin, even, except from himself.

Now, I am a subjective idealist, and to me nothing I experience is reality because it doesn't satisfy 1 or 2 above 50%.

Perhaps it is better to avoid the terms 'real' and 'reality' because they are difficult to use in a formal sense. For this discussion, yes experience is 'unreal' because there is no external backing to it. (Hence dismissing both philosophical realism and general realism.)

For the general reader, they tend to think in terms of 'my reality', say. In this sense, for the subjective idealist all of experience is reality - there is no secret substrate behind the scenes. One might say "mind" or "awareness" is the true reality, I suppose. But this doesn't work in the same way as we say "matter" is the reality in materialism, because experiences are 'made from' mind in idealism, whereas experiences are not 'made from' matter in materialism. But anyway, we can happily agree that subjective idealism is - of course - not realist.

"The subjective idealist recognises the room around him as a floating image, transparent and without solidity - without origin, even, except from himself." This I think is a skillful image you paint, however, this isn't what "reality" is, is it?

Seems to be, to me? ;-) You know what I mean though, from the paragraph above.

I agree that there is no substrate, but there is a secret "behind" the senses (although not literally behind).

Right. I've tried to convey that in the past using metaphors (of course) of things being "enfolded" and so on. To communicate that 'everything is here right now' even if it is not presently in the form of sensations.

That's why the Daoist sages say, visions blind the eye, sounds deafen the ear.

As the sun hides the stars.

Well, my preferred species of it isn't at least [not realist]. Maybe you prefer the realist flavor? I currently lean toward anti-realism.

And meanwhile, these terms are so unfortunate - mixed in as they are with 'being an idealist/realist' in the sense of pragmatism. Bah. Notions of realism/anti-realism can seem almost constrained to a materialist-type framework (or rather, a dual view). I probably don't tend to think in those terms at all, until it comes up in conversation. I've always taken things to be "real at what they are", even before getting into Berkeley and then moving on. Not through deliberate choice, probably through ignorance initially, in fact.

Thoughts were "real thoughts", chairs were "real chairs", experiences are "real experiences". I was very quickly into the idea, because of playing with memory and stuff being my first interest, that any notion of a "real world behind the scenes" as itself just a thought within my mind, in the same "place" as the world in my mind.

I think so. ;) I am convinced that I know what you mean.

I'm convinced that you think you know too. ;-)

...

He never even once abandons the formula to just say "there is no self." In one Sutta the Buddha is asked point blank if self exists, and he remains silent. Surely that was a great opportunity to say "self doesn't exist." But the Buddha passes up on that opportunity and doesn't go there.

This is true. That is because the true self is not a "thing" and is not of "things"; it can neither exist nor not-exist. Only objects can exist or not-exist, and there is no object involved here.

Where it is tricky is that we talk of this through the "puppet" of this personality, an adopted shape for expression. The desires and actions and views of the puppet are arbitrary. There is, in a sense, nothing there. There is no objective self therefore.

The puppet doesn't come bundled with its own will.

I agree. That's why I said "through" the puppet personality. The puppet has no causal power, it is merely a pattern through which experience can be funnelled. Since it has limitation - because it has form - if you accidentally identify with the puppet, you will limit your abilities.

Or, worse (and more accurately), you will associate some parts of experience with yourself and your intention, and the rest will seem to happen to you, even though it sometimes mysteriously reflects your feelings, for the good or the bad.

That's something I agree with. Also, if you identify with the puppet you'll start thinking you've been born and will be subject to dying, because that's what puppets do: they're born and they die.

This leads to: What aspects of your experience are due to your misidentification with the puppet, and what aspects are due to your true self?

How do you distinguish, say, between puppet desires (wants that arise from the structure and world-as-perceived-by the puppet) and true desires, those that arise from being the universe and knowing everything.

After all, identifying with a puppet happens at a pre-puppet level, so it is an aspect of my true self.

Well, it happens within awareness, just as any identification with other world (pattern/object) aspects. You are still just looking at the puppet-pattern, but confusing it is "you" because it's all you see, seeing the thoughts seeded from the pattern as "yours" in a more global sense than they are. Important: There are no levels. Where would levels be? There are no hierarchies either. Those are conceptual, organisational frameworks: thoughts. Everything is at the same level, even different granularities.

I don't. And I don't recommend anyone try that. Instead one should evaluate desires not in terms of true/false but in terms of skillfulness, in terms of the outcomes they lead to, etc.

Those evaluations will themselves come via your identification or focus. The thoughts that appear will arise consistent with the puppet-structure if you're still attached to it. In other words, the desires associated with the puppet, that arise through the filter of its patterns are deformed and not what the larger you desires (necessarily). It's what you think you would want if you were just the person the puppet thinks it is. This isn't just about yachts. Even the desire to live forever or have infinite power could be a desire sourced/filtered via the puppet-pattern. Until you release a hold on that pattern, then you won't feel the actual flow of your true self, or at least it will be eclipsed by the persistence of the puppet image.

So, how do we tell what we, as our true self, truly desires?

As I said, you're confusing the issue when you ask your question in this way. Your question sharply segments desires into true/false, and that will impede your reflection if you go any further under that assumption.

Well, in a sense the puppet-pattern is responsible for the thoughts that emanate from it, but only in the sense that the a whirlpool is responsible for its shape. Causally, of course, it's doing nothing. It may well be that the only way to notice that you are not the puppet is for the puppet-pattern (or world-pattern as unfolding via the puppet-pattern) to result in such a thought. Fundamental awareness has no desires, of course. It is already complete.

You need to stop saying that the puppet is responsible for something.

Perhaps let's say "associated with" thoughts that appear related to the pattern. The pattern, the puppet and the world, actually appear within you. You are not a person, you are aware of a person and a world through a person. And yet, all that those things are, are you. So you have ultimate responsibility.

Fundamental awareness has no desires, of course. That's not true.

How can structureless openness have desires? There is nowhere it wants to be, nowhere it wants to go, nothing it wants to become. Only patterns within awareness can change, have a direction, have a desire (= an unfulfilled tendency) and move towards it. So, the puppet-pattern can have desires, the world-pattern can have desires. You as awareness can facilitate or obstruct those desires manifesting by holding into forms, patterns and preventing them changing - or instead allowing movement, or even more directly updating the patterns to accelerate change (however this comes with penalties re:balance and stability).

This thread is the more interesting one...
...it's the "the territory is/becomes the map" thread.

[QUOTE]

Topology
Topology (from the Greek words τόπος, 'place, location', and λόγος, 'study') is the branch of mathematics concerned with the properties of a geometric object that are preserved under continuous deformations, such as stretching, twisting, crumpling, and bending; that is, without closing holes, opening holes, tearing, gluing, or passing through itself.

[END OF QUOTE]

POST: Feedback model of experience

[POST]

==I've been interested in feedback loops as a model for a lot of different things and I tried to communicate a consciousness feedback loop, but I was too vague before. I would like your help in expanding on this concept.
I declare two systems we'll call belief and perception. They are in a feedback loop that we'll call experience. Perceptions seem external and beliefs seem internal. Perception influences belief by manifestation. Belief influences perception by intent and willpower (maybe? Haven't hashed this out very well).
In the materialist experience perceptions absolutely must influence beliefs. To phrase it in terms of a feedback loop, perception amplifies the existing beliefs through manifestation (the signal). To a materialist, if beliefs influence perceptions, they're probably misleading until verified with more perceptions (experimentation as extremely compelling confirmation bias). Anomalous perceptions, while possible due to beliefs usually taken for granted, are discarded as faulty equipment (believe none of what you hear and half of what you see).
Wizards tend to lean towards beliefs influencing perceptions strongly such that each and every perception is possible based on our beliefs and they're prone to what would usually be considered anomalous experiences. The signal going from belief to perception is the intent combined with willpower (the willingness and sincere desire to override perception).
However for me, it's easy to fall back into materialism because my will to change my beliefs is overpowered by my habitual perceptions. Or, my intent+will signal is overpowered by my manifestation signal.
[<http://en.wikipedia.org/wiki/Feedback>]
To consider a chicken and egg argument is fruitless because they monistically exist simultaneously with experience. [<http://www.thefreedictionary.com/monistically>]
Thanks for your perspectives.
Addendum: I realized the source of some of my confusion.
I will replace perception and manifestation. So belief influences manifestation through perception rather. The strength of that pathway is based on repeatability. It's a mostly passive pathway, yin, etc.. The belief system receives perceptions from the manifestation system.
Willpower is the strength of the belief=>manifestation pathway and intent describes the information to manifest.
So to re-word my wizard and materialist stereotypes the materialist is extremely passive and the wizard is extremely active (in regards to influencing manifestation and belief). I'm onto something...
Here's a blurry picture of a graph for you to peep, complete with the remnants of my dinner:

[END OF POST]

This is along the same lines of my own thinking, however I approach it a little more simply in terms of structure. Belief and perception (experience) are of the same thing - they can be seen as the same thing at different stages of solidification. In fact, my next multi-part post was going to be called Magick is Memory (along with one on Overwriting Yourself) and be on this very topic. But, here goes with a quick summary version; see how it fits in with your ideas:

Passive Memory

Every experience that arises leaves a trace in awareness, an after-image. That trace influences subsequent experiences, which are filtered through it. Which in turn strengthens the trace. In short, there is a memory effect. Over time, certain patterns become more entrenched - habits, beliefs - just as the flow of water deepens channels in a landscape via erosion. This is the passive mode and this is how the landscape of our worlds are formed at the start. There is a randomness of activation (random rainfall) which due to the clumsiness of randomness seeds patterns (eroded areas), which eventually turn into stable habits (deepening erosion into channels and pathways). Experience shapes beliefs shapes experiences. Beliefs are the same as habits of the world. Beliefs are not things you think, they are the structure of your world. It is not just apparently "external" experiences that participate in this effect though: simply thinking a pattern will also contribute to this effect, although to a lesser extent.

Active Shaping

The magician realises that this is the situation, and seeks to benefit from it in an active mode, using a couple of extra insights:

- The resistance of patterns to change is related to his gripping of those patterns, his identification with those patterns.
- He can stand back and identify as the background awareness, which is unaffected by pattern and memory.
- If he does so, then the effect of his consciously directed thoughts (summoning a 1st-person imaginary experience corresponding to his desire = intention) is greatly amplified, even instant - because he can completely sidestep trying to push it and hence resistance.
- In the extreme case, simply deciding will be sufficient.
- It is generally easier to have manifestations that are consistent with the deepest habits, so that the occurrence can still be dismissed as "plausible". For instance, those lost keys don't directly materialise in mid-air, they appear in the drawer you already looked in (but perhaps you hadn't looked properly?), and so on.

Effectively, the magician makes his world more vulnerable to the 'memorisation' effect, leading to a more rapid circumvention, alternation or dissolution of existing habits - for a one-off manifestation or for a change in how the world works. In either case, the magician is "inserting new facts" into the world; he is updating its memories to correspond to the world he desires.

The overall situation is somewhat sketchily illustrated in this diagram.

Additional Comments

Was looking at the initial version of your post, just saw the update - your little picture is basically the "process diagram" for my own! Nice. I do believe we don't need the extra step of separating them into "systems" though in the end. That's fine for illustrating a process, but there is no separation between filter and flow, between belief, perception, experience, manifestation - it's the same patterns being activated.

There is only awareness - with raw creativity (randomness) and memory (persistence) on the passive side; the active side is simply awareness deliberately shaping itself, changing or circumventing memory at the root level.

This gets away from the chicken-egg metaphor problem. I originally started along this line of thinking to describe how people always think they are right in their world-view - could it possibly be because they literally experience their beliefs as reality? Beliefs are the laws or habits by which your world unfolds? How to intervene in this? And so on. This became a disussion in materialism vs idealism vs nondualism over at a philosophy forum. Recently reread Edward de Bono's The Mechanism of Mind, which is very strong on memory and pattern metaphors. It's out of print but I've posted my PDF copy at the link. You might find it interesting.

However for me, it's easy to fall back into materialism because my will to change my beliefs is overpowered by my habitual perceptions. Or, my intent+will signal is overpowered by my manifestation signal.

This willingness to ignore the evidence (what you are seeing and how you are feeling) and push on regardless is one of the most difficult things.

In my reply to Nefandi I suggest an alternative strategy. Complete skepticism of results on the passive path but overwhelming willpower on the active path (yet you may not believe the results are even significant until it gets crazy).

Hmm, interesting. The identification with the background rather than content is maybe a version of doing this, actually: It disengages you from taking the passive arisings "seriously", reducing the fear factor of disruption them, which then makes active assertions less troublesome. You mention something else which is worth pursuing:

But Ananda becomes surprised when Tathagata points out that what he's using to "investigate it" (i understand it as, consideration/contemplation) isn't his mind, which disturbs him.

The word "mind" is really problematic. It gets used for "thinking" and for "the space my thoughts and sensation arise in" and also for "the object-less non-material material that is the substrate for experience, and is my true nature". I see what we "are" as the background ("awareness"), any object or pattern content or traces - beliefs, experiences, etc - are all of the first two types. Magick is about modifying the patterns. Insight or enlightenment is about recognising yourself as the background rather than any pattern. Of course, the two go hand in hand, since patterns are "of" the background. But really it needs defined every time it's mentioned, it seems. The origin of the world then, which required pattern and persistence, is not itself a property of awareness. An finite number of random 'flickers of pattern' can have occurred before the first one that lingered as an after-image, a memory, then even longer before two occurred, which then allowed a stable and interrelated, self-supporting set of patterns to emerge.

(The word "consciousness" is also problematic because people think of it as localised self-consciousness.)

Either way I got some serious stuff to chew on. Look forward to your post.
I don't assert my model as reality, it's a map, it's a model. I don't want to confuse the model and the reality. But if it's a useful model, I'll keep it around, you know?

Usefulness is the way to judge things, definitely! And models are a great way to explore your assumptions and a soften the edges, give you something to work with. (Because it's hard to start with "everything is possible" and then truly adopt that. Even trained pilots, who know they can fly because of the machine they're sat in, still take off from ground level...)

Although, contrary to the old saying, actually the territory does become the map after a while, to a greater or lesser extent. Of course it has to, otherwise we couldn't have magick (= assertion of truth and subsequent consistent effects). The more flexible and ambiguous the situation, the more easily the effect becomes "memorised" by the world. For instance, simply and truly deciding - and feeling the certainty of the fact - that you will have a lucid dream will give you lucid dreams (as recent poster here has rediscovered, although a few have said this in the past).

...

That Jacob Lieberman book is interesting. It think his central experience was accidental though, but he almost got there. Great point that the assumption of an external world (or, assumptions about vision) inhibit progress:

People don't see with their eyes unless they centre their attention there, thus limiting their vision drastically - what's meant to happen is that vision comes to them in their minds. If they'll let it! Simply changing "where you sit" in your body-space, and letting your awareness open out instead of concentrating, can have a dramatic effect. Hence "seeing from the core" and similar approaches.

This technique explores the central line of the body. It relates to the spine and spinal cord, as well as to the chakras, the flow of chi and other energetic paradigms. The center or mid-line is especially important in vision because our two eyes need to coordinate around this line in order to work well together. Once the student has learned to find this central, energetic line, she/he finds the place on it that is the most comfortable, and rests there. Most people have a place inside themselves that is familiar and feels like home. For instance, one person may have done a great deal of martial arts, and centering in the belly is easiest. For another, centering in the chest is more natural. We each have our preferences and styles. In addition, vision is not always the primary sense we are using at any given moment. We cannot attend equally to what we are hearing, seeing and sensing. One sense must be the most important, or “the figure”, while the others are less important, or “the ground.”
-- Seeing From The Core, Rosemary Gaddam Gordon

But if people won't give up control, of holding onto their old way, they're screwed.

Good test to do with yourself: Sit back and be in the room. Do you feel that the room around you is in focus, just "there"? Or do you feel that you are scanning around, and that the world is blurred in parts, like in a movie scene? If you are relaxed and letting vision "happen", the whole room should be just "there". Because it's not actually possible for your eyes to be seeing the whole room anyway; you are dreaming it.

The same lessons apply to perception and action more generally.

Seeing from the core is a deliberate choice. It's an aspect of control, not the giving up of it. Maybe you mean, people need to learn to exercise control in a more skillful manner?

Yes, the wording depends on the perspective. They are giving up trying to control seeing by effort, but of course in ceasing to do that they gain influence over their experience more fully. Their previous attempt at control has obscured the nature of the situation, and the nature of the control they should be exercising.

Enjoy your walk.

It's not just that they gain more influence. The act of the giving up of this "control" is a deliberate choice. It is a type of self-control (or self-influencing).

At first, they are are influencing the wrong thing - creating the wrong thing: generating the experience of feeling their eyes, rather than of open vision.

TriumphantGeorge Compendium - Part 17

POST: Lust of result

To me, magickally speaking, "lust for results" has a couple of interpretations:

- In order for change to occur, the current pattern of experience needs to unfold and flow to the desired state. Continually checking or focusing on progress is equivalent to "holding on" to the current pattern; it implies the current state rather than the future state and keeps you there.
- Lust for results implies doubt - you end up creating the experience of doubting, than of having.

Say manifestation works by you adopting a pattern or desire as being "already true" - either already true right now, or that it is already true that it will happen at some point in the future. The truth being accepted or known at the implicit level, it is inevitable that the everyday apparent world will correspond to it. Then anything that implies your desire is not already true right now in "configuration space"*, will cause a problem. Lust implies lack. Satisfaction implies abundance? Which is why the proper version of positive thinking - maintaining a constant "feeling" of certain fortune, optimism and happiness and following the intuitions that arise from that - is a powerful general practice. By which I mean the imaginary underlying timeline space where all possible moments are arranged. Inserting a fact into any point in the timeline means it is true now and forever at all moments. Inserting an event into February 2015, for instance, means that it will be true that "this event occurs in February 2015", now and always.

POST: "I think therefore I am" vs "I experience therefore I am"

[POST]

Lately i have been thinking about arguments against materialism, but i've realized that this debate is so confusing because both sides are arguing from a different premise as to what consciousness actually is.

This lead me to Rene Descartes famous quote "I think therefore I am". Now Descartes was not a materialist but a dualist, but his mechanistic view of the universe certainly got physical-ism going in a big way. But if you really think about the quote "I think therefore I am" these five words are really the foundation of physicalist thinking. We take this quote for granted because we assume saying "I think therefore i am" that we are talking about experience, but if you think about it, the modern equivalent of it is more along the lines "I am a data processor". In other words instead of identifying with that which experiences thoughts and feelings, it is identifying with the thoughts and experiences themselves.

The way i see it, intelligence and consciousness are not one in the same thing, intelligence is not consciousness itself but a byproduct of it. According to Bernardo Kastrup the way materialists are avoiding the hard problem of consciousness is by using what is called pan psychism the idea that matter has conscious. I realized that i had pan psychist outlook mixed with an idealist one, but i didnt realize that pan psychism was still very materialistic because it still implied matter is fundamental and mind is secondary.

Matter itself can contain informtion the same way a computer can, but that doesn't necessarily mean it is conscious. Rather than being conscious it processes information in a self reflective way, but it does not experience itself, but the thing is materialists think that these self reflective information processes are consciousness.

This is the reason why materialists have such a hard time with the p zombie concept because they think that thoughts and experiences are the exact same thing. A p zombie has thoughts but it doesn't experience its thoughts, we as conscious entity's do experience our thoughts but according to buddhism and eastern philosophy we ourselves aren't our thoughts, but merely a kind of formless observer that watches them.

If you think about the scientistic materialist type, they tend to attribute a large part of their identity to their intellect and scientific knowledge, and rather than realizing they are experiencing an intellect they think they themselves are the intellect (they say, we are our are brains, a data processor) which makes sense why they believe they can upload their consciousness to a robot a la Ray Kurzweil.

So in summation to say "I think therefore I am" implies you are your thoughts and to say "I experience therefore I am" is to identify with the thing that experiences the thoughts and not the thoughts themselves. And don't get me started on the not even being that which observes the thoughts, i don't know how i feel about the whole anatman concept yet. I mean this phrase "I think therefore I am" is one of the most famous statements in western philosophy and is the foundation of the western concept of the self. I'd bring this up to materialists, but i feel like i might as well be arguing with creationists, they say they are open to evidence but i dont believe that anymore.

[END OF POST]

Nice post. Yes, I reckon "I think therefore I am" is better viewed from an idealism perspective: that there is mind, means I am?

Like The Dreaming Game exercise suggests, you are the "wide open unstructured space" in which all experiences arise, including the "feeling-awareness" of being an observer. We are actually awareness, and thought and sensations and images and objects, they appear within awareness and are patterns of awareness. That describes our 1st person view. Meanwhile, the 3rd person view - that of seeing other people's brains, all that - appear within the 1st person view. But really, the whole world is within you (awareness), including "you" (thoughts and body sensations). The great thing is, this means that materialism is within idealism, so you get the benefits of consciousness-experiences, but also the benefits of science's codification of observed regularities. Over at Bernardo Kastrup's website and forums some people have been trying to bash out a modern way to phrase this; his books are worth a look. It's not an easy task to describe this, even thought the experience itself - realising the nature of your reality - is easy and direct. Basically: awareness/consciousness is fundamental. And it is obviously true.

EDIT: This: [<https://groups.google.com/forum/m/#!topic/metaphysical-speculations/sZzukBdzC5s>]

POST: Loudness versus Realness

[POST]

You probably have all encountered a person, politician, entertainer, who was particularly loud and obnoxious, and while they may not be more truthful or entertaining than others, they seem to get all of the attention because they are so loud. People will think one comedian is funnier then another comedian because he/she is very boisterous and loud, even if what he/she is saying isnt funny at all.

This is what its like when it comes to defining the inner dream world and the outer one. Its not so much that the outer world is more real then the inner dream world, they both have similar levels of realness, the outer world just tends to be louder and the inner world is quieter. But the problem is that many people confuse "realness" with "loudness" in that if something is loud then it is real and if it is quiet it is unreal/imaginary. It may just be so that the loudness of this world is merely drowning out the presence of other worlds

But what im pondering is, is the loudness of this world natural or is it something we create do to our own intention/attention?

[END OF POST]

Great observation. It's been said elsewhere (in idealism books) that the reason we don't experience, say, other people's thoughts and perceive locations elsewhere, is that our local experience is just "brighter" - similar to how we can't see the stars on a sunny day. They're still there and they are within our awareness; it's just that the "sun" of local experience is so much more intense. Psi research and so on would indicate that we can tune in to this though; filter out the strong patterns and ripples, focus on the subtle background ones.

POST: Twice perfect.

Aw, very nice. The calm of open space, with the power to tinker in a relaxed manner.

Can I get a how-to guide?

Start simply, before getting too extreme. Do the basics:

- Do a regular relaxation/release exercise - just lie down on the floor each day for 10 minutes and let go completely to gravity, give up totally; it doesn't need to be a formal meditation.
- Get yourself a lucid dream experience or an OBE experience. That will loosen you up.
- Read about idealism, such as Bernardo Kastrup's Why Materialism is Baloney. And read up on non-dualism with practical exercises: I recommend Rupert Spira's Presence Vol I & II.
- Check out the reading materials for magick on this subreddit: see wiki.

POST: Maintaining an attitude and a frame of mind of a Deity.

So, key to this I'd say is expanding your identity to cover the whole universe. You dissolve your commitment to the solidity of the content, but recognise the ground of the universe to be yourself. To dissolve your personal history is important. It is present within your current experience right now, and seeds it, as you indicate. There are exercises and other experiments people can do for this sort of thing (some mindfulness-related, some about updating your imagination, some about revising your past by replaying it and editing it). Everyone has their own approach. Is it worth gathering suggested exercises together somewhere with results? Or is it too early for that sort of practical thing?

No, the universe is too limiting of an identity.

Okay, I used "universe" to mean "that which contains everything" there. So that vast, infinite unbounded space for me is the universe, or "me". Alternatively, I could have said that the universe is the 'content' (all objects) and I am that which the universal content arises within. Same thing. We need some word to use.

Sure is. I even put one exercise that you suggested into a wiki for this reddit.

Okay, good. Well, maybe tweak it up and people can think of what they'd like to contribute. Personal experience, plus: There are lots of books where there's one exercise or little snippet - e.g. the Neville Goddard approach, there's a good exercise or two for undoing your past in Reichian stuff, whatever - and it can save people actually tracking down and reading whole things if we can just cut to the important bit.

How about mind?

Hmm, 'mind' is a problem because it's commonly used to mean "the place where personal thoughts are". Don't really want to say "mind of God". We've played with calling it "vast unstructured place" where a "phenomenal space" appears (sensations) and/or "ideational spaces" (dreams, thoughts) appear without necessarily being spatially connected, all that. But that's too involved. What are others? The "ground of being" or "the ground", "infinite awareness", "underlying consciousness"? Is there something that sounds more, well, solid and practical?

I think it is a mistake to think that this is what mind is. Mind contains all of reality. . .

That's very nicely written. I agree, but it is true that your everyday person thinks of a mind: theirs.

. . . once common misconceptions about them have been eliminated.

Yes. "Mind" does have the benefit of not having the sense of a restricted space or structure, and implies awareness/consciousness of course. I've seen "Mind-At-Large" used to try and encapsulate this, but actually if you clarify that mind isn't divided and supports perspectives, it seems misleading, since it implies a spatial divide between different individual minds. Anyway, when it comes down to it this is about how we refer to it in this forum. I wonder whether if it might be an idea to have a post which clarifies the "picture of reality" we're using, with terminology. (I say this even though I dismissed the call for a "terms of reference" post a while back.)

[Cross-post because a point occurred to me:] The trick of "waking up to the moment" as if you've just been dumped here is good for this.

Also, you need to bear in mind that if you are a deity-like figure, you may have made some decisions prior to current appearance that you are now unaware of. You may have set some stuff up, a bit of a path or whatever, that restricts your complete freedom to some degree.

Now for the mandatory Alan Watts' "What if God got bored" video link [<https://www.youtube.com/watch?v=ckiNNgfMKcQ>].

POST: Videos of the siddhis (warning: animals harmed/killed in the making of these videos, might be disturbing to some, nothing gruesome though)

Always interesting. But I wish the videos were more complete. For instance, I'd like to see the paper selected from a random stack of paper, then held up, then the burnings (so nothing was placed on it beforehand, chemicals etc activated by motion or time). I'd like to see the lighter taken from someone's pocket, then placed on the floor, then move (so nothing was connected to it, or underneath it, nothing unusual about it). Why not levitate the lighter rather than just move it sideways? That's what I'd do. Why not control the bull more directly, summon it to me? Why not ignite the paper at the edges, where it was being held by those guys' fingers? That would be far more fun. :-)

Otherwise there are other ways to do those things, and they can just be parlour tricks. (Original source video by Lawrence Blair for that is here [<https://www.youtube.com/watch?v=Aos0hnwiHt8>]). He's not very impressively critical, unfortunately, a bit of a gee-whiz enthusiast from the start. Sometimes magic (sans "k") tricks are ways to promote a movement whose real power is mostly invisible (healings and so on). I remain open.

There are plenty stories of monks and everyday people having siddhi-like experiences though, and people who have no bias in this area but have pursued 'realisation' report that "they do come".

One of the side diversions of this whole thing, is at a certain stage to cultivate the siddhis, powers, that do come with the seeing of who one is - and they do come.

I just wish we'd catch the good stuff on video properly...

This kind of stuff is easy to doubt if you want to.

One should start with doubt, and work from there, in these cases.

It's part of the show this one; it has "drama". (Particularly if seen in full context.) Just as he's landing during the fade-out, the bottom of the wall seems to move a little, for instance. And you'd keep the camera still and on him all the time if it were really an 'investigation'. (Anyone who could do this for real would be a fool to do it publicly.)

The usual 'real versions' of things are always less dramatic, more like glitches or reality shifts. No gestures should be required for magick, only intention. Gestures are just to persuade yourself. Or for fun. Direct right-now manipulation, there's not much of it. Gestures in public performance are for misdirection and showmanship, for entertainment or promotion. Aside: It's amazing to watch an expert at work - e.g. Derren Brown doing quite simple card tricks on camera where you can see exactly what he's doing if you look (view first then read brackets if interested). The 'Smoke' trick (deck rotation 1:35, rolled prep card pull from box 2:03, cigarette drop 2:15, described here) and 'Card Prediction' trick (card push at 0:57, card peek at 2:42). In the former, though, Stephen Fry does seem to do something odd himself, just after lighting up...

POST: On being human, whats up with that?

I've taken the 'non-human' stuff to be more in the spirit of "self-realisation" - i.e. that your true nature is not a person, but the things that is aware of being a person. You have humanity, but fundamentally what you really are is not a human. You might consider that more of an expanding-out though. But then, all the same things follow from that.

You just reminded me that being alone was also a huge fear for me and probably still is. And a big part of fearing to be alone for me is also fearing to be misunderstood. I used to really not want to be misunderstood. I've been taking some little active steps to let go of my desire of trying to be understood. I'm trying to teach myself that it's OK if some people don't understand what I am saying. Because this really used to obsess me, and that urge still visits me like "wait, no that's not what I meant, I should explain exactly what I meant!!! aahhhhhh!!! I am not being understood!! I feel alone!!" I'm trying to get a grip on that. It's also fear of being obscure or invisible.

"Self love" does get a bad rap in some corners, especially recently eh...

they confuse it with narcissism, which to me narcissism is actually self lust not self love.

Or fapping...I see narcissism as compulsive self-defence.

POST: Visualization within the manifest context region of experience.

This is an excellent breakdown of the nature of present-moment experience, best I've read!

So the important thing here is to feel and not just think.

And that is the magic key: to avoid thinking-about, which just creates images about things (ideas), and instead to use direct sensing, to explore what's there. Creation vs discovery. (Although what is discovered was once created, of course.)

We tend to think of visualising and imagining as something we do in a special 'imagining place', but there is only one 'place' really, where our sensory experience and our thoughts all appear, even though sometimes there seem to be different parallel/simultaneous 'spaces' within that place. You can stretch out your 'feeling' forever in the 'sensory space' (manifest) or contract it or bend it. It's a completely non-physical space after all, made entirely from 'mind'. Depending on your view, sensory experience may or may not be 'inspired by' an underlying something, but that doesn't really matter. Because there's definitely no "matter" in your experience. You can overlay anything into the sensory space, or you can have 'parallel spaces' and put imagery in there creatively, or connect to other existing imagery - which might expand into a direct lucid dream if you focus in on it.

[This stuff is why I included the Rupert Spira and Greg Goode books in the reading list. They're all about these 'experiments' to explore your present experience, and read pretty much exactly like your post. But you have to do it to get it, really.]

Ultimately there is something we can call "basic space"...

I label it as a "place" rather than a "space" because the latter term implies a three-dimensional structure or grid in which things arise. When you 'feel out' you find that it's more of an "unstructured openness", and structured spaces appear within that. As in, "space" is itself an object-like thing. It also makes it easier to talk of different "spaces" whose locations are undefined (e.g. you are sat at home in your kitchen but imagining a tree; the location of the "tree" is often not really exactly located anywhere in the "kitchen space" until you make it so; it's in its own "space" elsewhere). The "spaces" notion also allows different versions of experiences to coexist, because they are not located with reference to each other.

But some people will probably feel like matter sort of draws your mind to itself...

Yeah. Apparent-material interaction take precedence because they're our 'ground level' I suppose - they're the "frame" for the rest of our experiences. Just as we often assume we are our thoughts and body because they are the most persistent, most unchanging part of our experience, so we assume this is the world because it is relatively stable and unchanging relative to dream-spaces and their content.

POST: The importance of magic in Oneirosophy

[POST]

This is the point where i go beyond dzogchen buddhism and bring chaos magick into the mix in terms of Oneirosophy. The reason mystisicm is emphasized over magic in buddhist traditions tends to be because the goal of buddhism is to get past material things. In other words buddhists tend to not be interested in using spells to get money, lovers, job offers, or cursing people because they see this as illusory and nothing to get hung up on. In a sense they see it as reinforcing attachment. But the reason i think magic is important is because i have seen how working with sigils have allowed me to see the dreamlike nature of this dimension. For example, in a dream you think of something and it appears, this often times lets you know you are in a dream. In the same way using a sigil to get something in this world allows you to see the world in a dream like way because you experience a direct cause and effect relationship between your thoughts and the external environment in the same way as a dream. Using a sigil to get money in this reality makes things seem illusory in the same way flying in a dream makes things seem illusory. This will manifest as a synchronicity, but it is important to use magic to induce these synchronicitys, because if you just let synchronicities happen, it still doesn't appear under your control. Synchronicity or coincidences are important because it is one way to see the material world operate under similar rules and cause and effect relationships as a dream world.

[END OF POST]

Thoughts: 'This' shared dream works pretty much as our personal dreams do, it's just that it's a little more sluggish. It's been around a lot longer, and so has built up more established habits. Meanwhile, our personal dreams are usually created anew to some extent, and so haven't become entrenched. Even if you don't deliberately intend, synchronicities are arising in alignment with your 'current direction'. You are always getting what you really, really want, or at least opportunities to do so. Until you 'intend' to change direction again. (Although we can interfere in moment-to-moment details, really it's the overall thing that is important.) This means that magick is just how everything works, all the time, anyway. You don't even need a sigil; **just a decision**.

(A further thought: If we were to take this seriously, perhaps then we'd have to shake the notion that we are 'located' in this world while we are off having dreams. It's more a case of us connecting or tuning in, but we have a default.)

POST: Open eye visualization to induce lucidity

[POST]

In addition to lucid dreaming, i think getting really good at daydreaming can be very helpful in terms of breaking the boundaries of reality. Because i think when we dream or even lucid dream we can still create a kind of dualistic distinction in our minds of waking vs dreaming. When one can induce very vivid visualizations or day dreams one can look at both worlds at the same time, in a sense having one foot in the material and one in the astral. For example i was on my bike yesterday and i noticed a basketball. While riding i left the basketball behind but i imagined myself dribbling, i imagined feeling the texture of the ball, the weight of the ball, the smell of the ball and i tried to make myself feel like i was in two places at once, standing dribbling a ball and riding a bike. What also helps to make you daydreams more vivid is to make your waking perception less vivid, this can be done by having your eyes partially opened. So what i recommend is to meditate and pretend you are somewhere else, somewhere you can imagine vividly with all five senses. But the goal is not to completely immerse yourself in that visualization but to try to balance the vividness of your daydream and your waking experience so they are as close to equal as possible. When done successfully this seems to kill the distinction between real and imaginary when both of these experiences are at similar levels of vividness.

[END OF POST]

You've just triggered a memory of the first book that got me interested in lucid-style dreams before I'd encountered the term, I'd completely forgotten about it until just now: David Fontana's Meditator's Handbook: Comprehensive Guide. Out of print now (the later version of the title doesn't have the same stuff), but it had exercises where you would practice each of your senses, and then attempt to create and enter a dream directly from the waking state, Tibetan Yoga style. Exciting stuff, and basically what's accidentally happening with "dream insomnia"?

...

That looks like a good list. I think the subreddit summary covers it quite well. There's a bit of this in each of those topics, it just depends on what people are in it for - e.g. Buddhism for the bliss-out, occult for the rituals - but those people would get bored here pretty quickly and self-select out. Nothing wrong with the occasional materialist troll, if it leads us to explore and clarify our thinking or ability to communicate. (And, y'know, we can always let threads die.)

This is almost like "practical philosophy" rather than occultism/esoterica!

POST: Paul Levy - Recognizing the Dream Like Nature of Reality

There are only 6 ways you can experience: 5 senses and mind. Anything else you think is different is just a product of the mind.

A more straightforward way to begin investigating this (rather than jumping ahead as some of the earlier responses have), is the recognition that all of those things occur in the mind - by which I mean the "aware perceptual space" that you seem to be, that all your experiences arise in, be that "the senses" or "perceptions" or "thoughts". That's basically the starting point for idealism, in fact: What is the nature of my direct experience, prior to my deductions about it? What things do I know for certain? And what things are actually part of a constructive narrative?

Yes I agree with you the perceptions can't occur without the mind, but that doesn't imply that there is not anything outside that is causing such effect.

It implies that it is meaningless to talk about something outside the mind - since you will never experience such a thing. In fact: are there any spatial boundaries to the mind?

And logically speaking, something which has an effect on the mind would also need to be made of the same "stuff" that the mind is made of. So: what is the mind made of?

Both of those questions can be answered directly, right now, in your present moment experience.

The argument is, roughly:

...that in your direct experience, everything appears in "awareness" and is made from "awareness" (or consciousness, or whatever you want to call it). It also has no boundary. That is your starting point. You will never experience anything that does not appear within that, and of that. Furthermore, any thoughts you have "about" an outside or other materials or properties, will also be within that, and made from that.

So how does it make sense to talk of something outside of it, or made from something other than it?

Extras - Do you ever experience your brain doing anything or translating anything? In fact, do you ever experience "a brain"? When you talk of "a property your brain can translate as experience", what form would that "property" take and how exactly would it translate it from that form in into the form of "experience"? Finally, if you are imagining that right now as - what form is that imagining taking? Is it not a thought, within awareness, made from awareness?

You just talked about external things. Are you saying that what you just said doesn't make sense?

I'm trying to save on quote marks here. ;-) But I don't believe I did talk about any actual external things, things external to awareness. What would those be?

Well we are not gonna go anywhere. I am seeing how subjective idealism is just a way of interpret things. I know people here is not gonna agree. No matter how you call the things the world is gonna still being the same.

Actually, forget subjective idealism for a bit - really it's all about two aspects:

- There is the relative content of experience.
- There is the fundamental nature of experience.

You can argue about the first one, but the second one is something that's pretty much a direct experience which is available and cannot be argued with (it just "is"). Idealism is the interpretation of the former, in terms of the latter - whereas most schemes don't even consider the latter, adopting a naive view of perceptions and conceptualisation. So it's fine to talk about brains and the world and all that stuff, but in the background we recognise that those things all occur in the same context, of patterns within awareness. Literally look around right now, and recognise that this is all arising within your mind-space, include your body sensations and so on. In other words, your direct experience is of being an "open space" in which sensations, perceptions and thoughts arise. Any conclusions you draw beyond this, are narrative fictions, abstractions. For example, the idea that "the world" is of the same format as your present moment right now, is an assumption. Given the above, in what sense is the room next door actually "over there"? Spatial extent is part of an experience, it is not a necessarily a property of the world as such, just as the colour red is not a property of the world, and so on. So idealism is really saying: throw away assumptions, start from what you know to be true directly, and build out from there - all the way avoiding the reification of abstractions.

Note - I'm not trying to sell the perspective here or persuade you of anything; I'm just trying to describe it so that you understand what it actually is.

POST: The question that would reveal everything to me.

Do I, or any other perceiving being, have the ability to choose without being conscious of the choice being made? Or to put it in another way; if subjectivity is true, and I create all of my surroundings, then how is it that I do not recall choosing my surroundings? Did I do it beforehand and then choose to do a memory wipe or do I choose in this moment what my surroundings should be?

It's because you have accumulated patterning. "Choosing" is an experience; relative creation is a shifting of state. They are not the same thing. You do not experience shifting as such, you only experience states. Pretty much you don't choose your surroundings and actions specifically; they are simply logically implied by your current patterning, as part of that patterning. All this means your current state logically implies your entire experience right now and forever. Which means fundamental creation has already occurred, always - all you can do is redistribute the relative intensity of contributing facts via intention (=summoning a particular pattern or fact into greater prominence). Meanwhile, observing something in the senses is equivalent to "fixing" a particular fact, increasing its contributing intensity to a maximum, which is why subsequent experiences tend to be coherent with prior observations. When it comes to intentional change and the final result ("do I choose my surroundings in detail?"), a useful metaphor to consider is that of moire fringes. Say I take one pattern and then intend another pattern over the top - can I pre-know the resultant pattern before I experience it? I cannot. Note that calculating the resultant would also be an experiencing of it.

For example, imagine a red car right now. Did you draw it in detail? No, it pretty much just autocompleted from the words "red car" into a particular instance of a red car. You could not have anticipated the form of the resulting car prior to its appearance in the senses. You had the experience of intending "red car" but you could not at that moment say you chose the actual car. Of course, if you take all the little intentions that have occurred over all time, all your accumulated patterning, then you did choose the exact red car in a sense.

Summary - You do not recall choosing because you do not generally choose your surroundings specifically. Creation does not occur in the way you are assuming. It is more like having a certain list of facts or patterns, whose distribution of relative intensity constitutes the "world-pattern" from which your ongoing sensory experience arises.

I wanna add another question. What happen with other people? Is it not a conflict that everybody choose their surroundings?

Everyone is their own copy of the world. At least in the sense that everyone is a conscious space which has "taken on the shape of" a particular state, from which arises an experience of being-a-person-in-a-world. This means that we are not sharing the world in the sense of sharing a place (in space and time); it is more like we are sharing a set of potential experiential patterns.

That doesn't answer my question. What does happen with everybody choosing their surroundings?

Everyone gets what they choose (within the limits of their own habitual patterning). As I said, the world is not a place.

...

Bah, I knew it. ;-) On the "choosing" thing, I'm pointing out that choosing itself is an experience apparently unfolding in time, the experience of choosing ("hmm, this or that, let's see") whereas a state shifts applies over all time, outside of it. So, I'd say our disagreement is only because you are describing things in time. The subconscious mind doesn't fill in any details as such - the environment really is already there, you might say; it's just that it's very dim. Associative triggering brings it into brightness. That triggering itself happens outside of time too. In other words, the full pattern of all experiences is within the current state, although it seems to unfold in time (because we've got a "things unfolding in time" pattern in our state). That's why we can know what's happening "next" - it's because it's already sat there, in a pre-existing landscape. Nothing is every created, it's just that the relative contours of the landscape are adjusted. That's why things can seem to be generated instantly.

What caused the patterns to accumulate?

Strictly speaking, we should say something like "redistribute" or "reshape" the world-pattern rather than "accumulate", but it's easier to think of each intention as the addition or overlaying of a pattern onto a notional baseline. We should think of the world-pattern as an already-existing landscape, which is modified by intention (actually, its modification is intention and vice versa). Where did the initial state come from? It didn't - it exists outside of time and is eternal. But since our intentions appear to occur to us in time, accumulation of modifications is an intuitive way to think of it.

Also if I intend to do something, didn't I just choose to intend?

We also need to be careful on our phrasings when referring to intention. So "intend to do something" might be better termed as "intensifying the fact of 'experiencing this action at this specific time'". But you can equally intend other, more general facts, or even quite abstract patterning. Meanwhile, it's perfectly possible to have the experience of choosing and then the experience of doing, and there be no intending involved, if those experiences are already baked in to the landscape. And one can also intend without having the experience of choosing first, in the sense of weighing up options - although one might have the experience of ceasing to change shape, based on a feeling of coherence. It's a direct shifting. Not easy to put into words. But...

In terms of your question, "how is it that I do not recall choosing my surroundings", it's because there is always a landscape (in the sense of a world-pattern of facts, and also in the sense of a "world as content"); there are always surroundings. Your intentions can shift or define that landscape - and intending to update one element will involve a shift in the whole landscape since all intentions apply globally - but you do not need to have the experience of "choosing" it for it to be there.

Okay, that wasn't as clear as I'd have hoped, but the core to all of this anyway is: content is not created in the same sense as, say, a games programmer deliberately creates a world, through selection and in time. Right now, the landscape of experiences is laid out, including the experience of choosing. That experience itself doesn't cause or do anything, that's an illusion due to the fact you only have one part of the landscape in the senses at a time. (Back to: experiences are local; intentions are global.)

All choice is done without the chooser being aware of the choice being made. Choice is an illusion of the brain. Sam Harris's lecture on free will explores this phenomenon quite rationally and I'd recommend you watch the whole thing, but I've linked to the most relevant bla bla bla bla bla

This seems a bit muddled, because on one hand you talk of a brain "doing" things, and on the other you talk of a non-spatial and non-temporal consciousness. If things simply are, then it what sense does "a brain" do anything at all? What is a brain, in that case? If you catch my drift.

Your consciousness causes the whole reality, but the brain causes the sense of individual identity. Your brain (and body) acts like a filter of consciousness, limiting perception to just bla bla bla bla bla

The point I'm really getting at is, and I could have been more specific perhaps: In your story of experience there, do you really need "a brain" as the substrate of your experience? What would your brain be made of? How exactly would your brain "cause" the sense of individual identity? Also, in what sense does consciousness cause reality? Does that mean reality is something different than consciousness?

From the subjective point of view (given the topic of this subreddit), would it not make more sense to dispose of the concept of a brain entirely, since we will never actually experience such a thing, and instead stick to what we can observe, which I suggest is:

- That our experiences arise within the context of an open awareness or consciousness.
- That our experiences arise as patterning of that open awareness (they are "made from" it).

More directly:

- The fundamental nature of experience is consciousness; the relative content of experience is patterns within consciousness.

We might see "brains" (grey lumps of stuff) within our experience, but we never experience being a brain - we only ever experience being consciousness, consciousness taking on the shape of an experience.

But to say that your individual experience is all there is is a solipsistic failure to account for the existence of that which you cannot experience.

I think you are still implicitly beginning with a notion of a spatial world unfolding in time, and then placing experience within that. However, it doesn't really matter for the larger point.

On the solipsism issue -

I'm not proposing a solipsistic view because I'm not talking about individual experiences, rather I'm talking about experiences which are of apparently being an individual.

Consciousness itself is "before" division or change; it is before multiplicity or relativity. We might use terms like "parallel-simultaneous", or use the metaphor of there being different experiences occurring at the same time, or sequentially, but actually we can't really speak of it at all, because "spatial extent" and "unfolding time" are themselves experiences, and out thoughts are formatted in those terms. It is already "too late" to speak of that which is before the experience. There is no context that can be thought of or described.

For convenience, I tend towards that metaphor which describes the world, rather than being a "spatially-extended place unfolding in time", as a "toy box" of potential experiential patterns, because it circumvents: the mistaken impression of "parallel" or "simultaneous" experiences; the idea that there is a world that is "happening" other than the experience of it; and the idea that there is an experiencer or "doer" separate from the experience or the "happening".

On the issue of subsets -

Again here, we have to be sure to avoid the idea of there being a selection in space or time - which means we also cannot have creation events within our model. The dodge for this is to say that all possible patterns already exist, and all that changes is their relative contribution, constituting a particular state. In effect, an eternal landscape whose terrain can be adjusted by becoming a different set of contours - by shape-shifting into a new form. ("Intention" is the name for the relative intensification or reduction of one of the patterns which constitute that landscape.)

As always, though, these are conceptual tricks to some extent - the direct experience is much simpler!

Haha! Well shit, dude, then we're saying the same thing, but just describing it different ways. I suspected that with my last post. We're just each catching the other in semantic traps, which is always the problem of using language to describe that which is more fundamental than language.

Heh! Well there you go. It does seem that a lot of our conversations here come down to terminology. Nature of the business of nature, I suppose.

POST: Intention and nonduality

The next step then is, how to intend more directly? How to step behind experience and generate it?

I'd say you can't get behind anything, because you are everything. You are the "open aware space" which "takes on the shape of" the world, of experiences. Specifically, at the moment you have taken on the shape of being-a-world-from-the-perspective-of-a-person. You don't generate anything, you are it and you become it, and between intentions you remain static (the apparent unfolding of sensory experience is a static pattern). It's probably better thought of as a pre-existing state or landscape, a world-pattern consisting of a relative distribution of facts or patterns (including a "time passing" pattern) which you can amend the contours of, thus changing which facts are most prominent and so changing your subsequent experience. To "intend" is therefore to shift your own shape as this landscape, and all intention is direct, in that it involves amendment of this landscape. However, some intentions or re-shapings will correspond more directly and obviously to sensory experience than others.

How to intend?

Well, there is no technique, and any attempt to "do" intention is doomed to fail, since it involves you identifying with one part of experience and trying to act upon the other part (which is impossible anyway), to partial collateral success at best. How does one shift one's shape? You-as-open-space simply becomes the new state, the new pattern. For direct intention (in the sense of directness of result), basically you just decide. This might be most accessibly described as "thinking an unbounded thought that something is true" or "asserting a fact" or "summoning a pattern in mind". If that is problematic, you can assign meaning to another act, mental or physical. You decide that, say, that conjuring this mental image means-that this thing is true, or that performing this ritual means-that this event will happen. Of course, this is a trick: you are still intending directly in the sense of asserting a fact, it's just that you are asserting one that implies the desired fact as an extended pattern. This distracts you from the fact that the conjuring of the mental image was by intention, as were the physical movements. You could just have intended the result without the intermediary, immediately updated the landscape, and experience would have apparently flowed towards it naturally, provided you did not resist what arose (thus re-intending against it).

(This also leads to the observation that: experiences are apparently local, intentions are actively global.)

The ideal?

The ideal approach is to perhaps begin with asserting that we are an open space in which experience arises - and then cease opposing sensory experiences from that point on, and to only occasionally intend particular facts into prominence. Otherwise we are thrashing our landscape, rippling the water of our world. Our experiences happen by themselves, but leveraging this requires an apparent relinquishing of control, in order to gain full control.

Your posts have been really great lately, TG. It's very no-frills. You're describing what there is, without trying to package things in accessible metaphors. Self as "open aware space", IMO, is one of the best and clearest concepts to come out of this sub.

Thanks! Where the metaphors come in, as I see it, is in that intermediate zone where we try to connect one perspective to another - for ourselves initially, and in our conversations with others later. Basically, re-encoding it to build a bridge between worldviews that allows people to move from thinking-about things to direct-knowing them. But once we've got there and we realise our nature directly, it's all much simpler: the thought (pattern) of something literally is that thing (albeit without a context) and that applies to "me"-as-person as much as anything else. Then, metaphors take on a new role: they are not just for description, they are for actively formatting yourself. We realise that's how they worked all along, that's how we came to our new understanding. An act of explanation is also an act of creation, or creative reshaping at least. There's really nothing else to say at that point.

...

[COMMENT]

A1: I'm not sure exactly how this fits in but maybe it will be helpful to you. This is a Taoist perspective on intent from Practical Taoism translated by Thomas Cleary. There's some Traditional Chinese Medicine stuff at the beginning I left in, because who am I to edit, but it really gets good by the end.

Intent As The Go-Between

Master Ziyang said, "Is intent only the go-between? The science of spiritual alchemy can never be apart from it, from beginning to end."

The Master of Round Unity said, "The reason practical wizardry needs intent is essentially just to assess the operation and keep it in balance. Intent is associated with the spleen; that is why wizards call it true earth. True earth means harmony. Now in medical practice, a pulse may be floating or sinking, slow or rapid, empty or full, but as long as there is stomach energy, one does not die. So the stomach energy is also harmony.

"In spiritual alchemy, active and quiet exercises must not be off balance in the slightest; if there is any imbalance, it usually results in illness. Throughout it is essential to assess relative gravity, relative buoyancy, relative strength, and relative freshness and to adjust them, causing yin and yang to match each other, so water and fire are evenly balanced, not allowing excess, which would cause other troubles. If not for intent operating this assessment, how could you guarantee you won't make a mistake and go wrong?"

Zhang Sanfeng said, "What is intent? It is the outward function of the basic spirit; it is not that there is also intent in addition to the basic spirit."

Master Ziyang said, "Mind is the natural leader: when it is used without artificiality, then what activates it is the basic spirit. This is the alchemical use of mind."

So you should not overactivate intent. Once you overactivate intent, you are trying to force progress and not being natural. The problems caused by the toil of forced exercises are not trivial; even if you use them skillfully, you still do not escape attachment, contrarily increasing the ailment of intention. This is why votaries of the Sect of Life do not reach the Great Way of absolute nonresistance.

The location of awareness of basic spirit is intent; awareness without an effort to be conscious is skillful use of intent. If you have even a single thought of deliberate arrangement, then you are overactivating intent.

[END OF COMMENT]

POST: Technique for developing intellectual lucidity

[POST]

I think that no matter how far or how deep we push our consciousness into the insane, the unbelievable, and the non logical there will always be those ideas and dreams that ultimately baffle us and come across as nonsense. Everyone likes to ponder the peculiarities of scientology, ufo cults, NWO conspiracies and such but is there utility beyond this beyond schizophrenic fantasy or amusing ideology? I like to spend time browsing these weird and peculiar dream worlds because it for some reason gives me a sense of lucidity, but I never really realized why until just now. Depending upon how one perceives things there will be different reactions to claims such as reptilians putting micro chips in your brain. The objectivist reacts to claims such as this as ridiculous in comparison to their own worldview. The subjectivist on the other hand does not have an objective worldview to compare this reptilian fantasy too, yet the logical part of their mind cannot accept this. So the effect that takes place here is you are exploring a dream/ideology you know is not objectively real but at the same time you don't reject said ideology either and just explore the particular dreamscape as it is without judgement, which creates the similar feeling one has of being in a lucid dream. But in order for this effect to be successful you cannot have another dream/worldview to compare to, you must let it sit in the void totally as it is. This is why materialists who explore weird belief structures don't have a sense of lucidity when doing this because they are comparing x(weird belief) to y (perceived sane belief). What i'm saying is recognize the weirdness of X but do not compare it to any kind of Y. You don't want to fully believe or disbelieve in X, its kind of similar to Robert anton wilsons general agnosticism but taken to the next level. So here is what you do. Find a book, online community, of an ideology that you could never possibly find yourself believing in under any circumstances (If you cant do that make up your own) read it but neither believe what you are reading nor disbelieve, neither agree nor disagree. Just enjoy the novelty of the strange exotic dream, and you will notice a strange sense of lucidity takes place. To make this more evident I will give you an example. Earlier today I was browsing a subreddit known as digital cartel. Its a subreddit of a man who seems to be suffering from

schizophrenia thinks he is jesus and that the NWO Is trying to control everyones mind. I was reading a section about how he was talking about how secret socieites have been planting micro chips into EVERYONES (literally every single person) for over a thousand years. This is something most rational skeptical minds of the mainstream world would not be able to accept, but instead of going with my reflexive Bullshit stance or to believe it forthright, I kind of just flowed through the ideas without emotionally or intellectually investing in them any way. One of the goals of this subreddit is to bypass this sort of objective mind that prevents us from seeing the dream like nature of things, yet it seems it can be used for our advantage in certain circumstances such as this. Eventually if one understands this state of consciousness it can be expanded into ideologies/dreams that seem more solid and more reasonable. But I think those who are new to the oneirosophic path should start with stuff that they in no way could believe in from the context of a conventional mind.

[END OF POST]

One things that comes from viewing the nature of experiencing as being fundamentally true, but the the specific content of experiences as being relatively true, is that you are in a state of permanent "open verdict". We see that all worldviews are "castles in the sky", in the sense that they are coherent and self-consistent, but none of them have a solid substrate as their foundation. One part of a worldview is true in the context of the other parts; none of the parts are true fundamentally; there is no privileged content-based platform from which other content may be judged. The question then becomes not whether it is possible that reptiles are running the world, but whether it is possible to have an experience "as if" reptiles are running the world. (Turquoise says yes.)

POST: So I just watched a video that I think you all may be interested in

[POST]

[<https://youtu.be/BNloJT8-pfw>]

This is a great summation of oneirosophic thought and a practical guide to using it. Amazing too, that I found this video after deciding I would go on YouTube and find a video instructing me to be able to manifest what I want in the world, and then gravitating towards this one. Guys, this is real. You are creating the world. Take responsibility of this, not like Atlas and have the world on your shoulders, but see that the world has no weight until you make it so godamn heavy. There's a part at the end that didn't make sense to me. Literally the last thing he says is "let your mind starve." At first I was like, wait, what? But upon reflection what I think he means is this: Allow your mind to remain empty, and only feed it what you create. The emptier the mind, the clearer what you have to create becomes. If your mind is filled with junk you can't even create anything, is what he's saying.

How does one keep their mind empty? I would say this is where meditation comes into play. Also, T-George has a daily releasing exercise that is similar to meditation but maybe easier? If someone could link that, that would be great.

Tl;dr Mind empty = choose what mind makes. Secret discovered when you know what you think, you can find. You find it through aknowledging the relationship between thought and self.

[END OF POST]

Also, T-George has a daily releasing exercise that is similar to meditation but maybe easier? If someone could link that, that would be great.

Here you go:

Daily Releasing Exercise

Every day, for 10 minutes, lie down on the floor in the constructive rest position:

...feet flat, knees up, hands resting on abdomen, a couple of books under the head so that it feels supported. Lie down in this position and give up, play dead. Give yourself to gravity, the universe, whatever. Let go of your body, your mind and - particularly - let go of controlling your attention. Allow your body and mind and attentional focus to shift and move however they want. And if you happen to notice yourself "holding on" again, gripping anything, just let go once more. Now, sometimes you might find that your attention narrows on a particular sensation, which then intensifies, peaks, then releases, after which your attention opens out again. That is fine. Just let that happen. Let anything happen, for those 10 minutes.

Meanwhile, for those interested in a bit more of Neville, he put out so much material that it can be hard to navigate, so here are some key document links to help get an overview:

- Imagination Creates Reality
- Awakened Imagination
- The Pruning Shears of Revision
- The Power of Awareness

There's also a great resource with all of his books and lectures: here [[Dead link](#)]. (The talk above is there, under its original title of Mental Diets.) If there can be said to be a metaphysics behind his material, beyond simply the interpretation of the bible as a series of metaphors for the true nature of experiencing, then it's in Awakened Imagination and Out Of This World. These actually work very well in partnership with Berkeley's Three Dialogues, I think.

==Hey, thanks for reposting that. You know, I don't recall the "knees up" being apart of it, is that new? Curious why you say to that, is it to keep one from getting drowsy from lying down?==

It's just what happens when you put your feet flat on the floor! Knees together might be a better way of saying it. Anyway, the linked image makes it clear what I mean, hopefully. The reason for that particular position is that, if you have no residual tension, you'll be completely relaxed into the ground - and if you do have residual tension, your body will eventually run out of energy maintaining its position, hence "release".

Haha well yes of course! But I mean why that instead of just feet straight out, lying flat? Is that not going to allow the same release of tension?

It puts your body in the ideal posture in terms of lower back and neck positioning, particularly the tilt of your pelvis. Which is also why you do it on the floor, rather than on a soft surface (which just tends to support your current posture with held tension). The idea isn't to "feel relaxed" so much as to eventually release into full support, which translates into effortless standing and movement later (and other things too of course).

POST: Why don't we discuss our own experiences more in this sub?

It's curious how language has become a type of prison in a way.

I'd broaden this, even, to say that descriptions have become a type of a prison - because, particularly recently, people have come to view descriptions as being accurate depictions of the world, even seeing them as the world itself, rather than "parallel constructions in thought" that are basically catalogues of (a subset of) observations to date. Where this gets tricky that, although descriptions themselves do not limit the possibilities of what might be observed because they are non-causal (apart from some mild patterning side-effects), intentions are causal - and so intentions based on those descriptions tend to imply those descriptions as their extended patterns.

For example: there may be no evil sprits as such, but if you start intending your route to the shops based on avoidance of spirit attack, your state will shift somewhat towards experiences "as if" there are such things, even though you have not specifically intended the "evil spirit world-description" as being true.

Q1: descriptions themselves do not limit the possibilities of what might be observed because they are non-causal...intentions are causal - and so intentions based on those descriptions tend to imply those descriptions as their extended patterns
so creating a description that is suitable to one's desires can be a basis for creating intentions
if i am not the source for the universe then who is watching? surya is the observer of karma (action) (and the knower of all dharmas) and i instruct surya on yoga (the process of union of saguna brahman with nirguna brahman) thus the solar system is permeated with knowledge
the result is kaivalya mukti 2 - wiki
at least that's my working description at the moment

[QUOTE]

Kaivalya
Kaivalya (Sanskrit: कैवल्य) is the ultimate goal of aṣṭāṅga yoga and means "solitude", "detachment" or "isolation", a vrddhi-derivation from kevala "alone, isolated". It is the isolation of purusha from prakṛti, and liberation from rebirth, i.e., moksha. Kaivalya-mukti is described in some Upanishads, such as the Muktika and Kaivalya Upanishads, as the most superior form of moksha, which can grant liberation both within this life (as in jīvanmukti), and after death (as in videhamukti).

[END OF QUOTE]

Since "intentions" are just "patterns you are intensifying into prominence" in order to reshape experience, those can be outcomes, facts, or something more like "formatting" (basic descriptions of how the world works). That's why metaphors are so useful, and that's where the idea of "active metaphors" comes from. If you formulated your outcome in terms of a "solid spatial world", then intending that will imply that worldview - intend that worldview - along with the outcome. If you formulate it in terms of an "infinite grid of parallel moments", then you'll be implying that worldview instead, and will find your overall experience tends to shift towards it. So you can, of course, simply intend the worldview instead to make a more general change. (Easy to test: Just go around for a couple of days intending that "life is a dream" and you'll quickly find that... it is. Then switch "life is a material world" and you'll get that happening instead.)

Your description, then, is one such "active metaphor" and you will tend to have experiences consist with that if you use it directly or implicitly. However, there is no fundamental "how things are" at all; which is why "seeking for knowledge" is an endless and pointless task. There's only one thing to understand, and that's something you do by noticing rather than working it out.

so fundamental formatting of the universe is also an intention

To slightly rephrase, just because "universe" is a bit of a messy concept: the formatting of awareness is the accumulation of intended patterns and their implications so far. And: since all intentions have a meaning, which is their extended pattern context, then to intend always implies the worldview of which that intention is a part, just as you say.

so what i notice becomes reality, but what i notice is reality

...since there's no separation between "noticing" and "reality". Which is why it can perhaps be better to phrase things as simply "experiences", because that removes the notions of an action, an actor, and an independent object. Instead, we have "experiencing" which "shifts (itself)" to take on the shape of states or experiences.

Q1: just because "universe" is a bit of a messy concept
what i mean by that ("universe") is - 'everything that exists materially' - because everything that does not exist in 'reality' exists in brahman (or as the infinite grid of all possibilities) waiting to be manifested.
the formatting of awareness is the accumulation of intended patterns and their implications so far
right - how i am now is as a result of what i have done before: i.e. the cumulative result of karma ("action") and those actions have been based upon patterns (my dharma or self-determined law of the universe -)
since all intentions have a meaning, which is their extended pattern context, then to intend always implies the worldview of which that intention is a part, just as you say.
yes, because that which is understood has meaning in context (the "extended pattern") based on the intention based on the pattern (in this case, my dharma, since i am talking exclusively about the universe)
...since there's no separation between "noticing" and "reality".
the only difference is time (i.e. actions performed) which of course is based on previous experiences (self (parabrahman, 'infinite grid') → pattern (dharma) → action (karma)
↔ all together as an experience (brahmasource - a state of consciousness)
Which is why it can perhaps be better to phrase things as simply "experiences", because that removes the notions of an action, an actor, and an independent object. Instead, we have "experiencing" which "shifts (itself)" to take on the shape of states or experiences.
yes

All good!

...

xoxoyoyo: my dick is bigger. now tell me about your dick

Q2: Well yeah I get that, but knowing about your dick doesn't offer any useful new information. I'm quite able to imagine more or less what other's dicks could possibly be like. What I'm not able to imagine are things I've never thought about or heard of before. If you've imbued your dick with some kind of amusing superpowers, now that I would be interested in hearing about.

xoxoyoyo: the point is that you are playing a shitty game of knowing yourself through comparison to others. If you are "doing better" then yeah, you can feel good about your "progress". If you are "doing worse" then you can feel bad about your lack. We tend to do this with everything. Instead of living life we live in our judgements and opinions about life. You and I are completely different people, different backgrounds, different lives. There just is no basis for comparison regardless of how much it appears there should be. Stuff like this tends to be pissing contests. That is why in many traditions they tell students to STFU about their "progress". Like at work, discussing salaries. No "good" comes of it.

Green-Moon: I agree with xoxoyoyo. The idea is not to 'compare' yourself with others. I don't know if that was ever your intention, but you will inevitably end up unconsciously comparing yourself even if that is not what you want. That is human nature. I agree it is quite interesting to read about other's experiences but its more along the lines of "entertainment" for lack of a better word, rather than actually allowing myself to let other's experiences set a benchmark for me. If the idea is to simply read up on other people's experiences then maybe we can make a seperate sub for it. I personally believe this sub is best suited to discussion about onerisophy rather than describing personal experiences. But as mentioned before the idea isn't to look at other people's experiences so that you can get an idea of "progress". I think it can negatively affect your personal journey with oneirosophy when you begin to bring other people and their experiences into it. It is about you and only you. It is important to remember that. But it is enticing to read other's experiences. I believe I read one of your comments about one of your experiences and it was very interesting. But I'm not sure if that's the best thing to do. We are here to discuss not to advise or show. This is our own personal journey and we can only walk this path **alone**.

POST: Hell Zen. (by AesirAnatman)

[POST]

[<http://hellzen.pen.io/>]
Not original content. Not to be taken as truth, of course. Use it to stimulate your own contemplation, if you find it interesting as I did.
Also, there are a couple good mind experiments in there.

[END OF POST]

[COMMENT]

A1: Here are the most interesting proposed exercises inside:

Grasping mind:

The Buddha, sitting in Jetta grove, said: "Past mind can't be grasped, present mind can't be grasped, and future mind can't be grasped." Why take his word for it? He was speaking from HIS experience. Try it for yourself and see what happens. Grasp past, present, or future mind I am waiting. Did you grasp your mind yet? Did you grasp any mind at all? Past? Present? Future? It's getting scary in here. Don't be afraid. Scary moments like these are what my Hell Zen is for. That's when it really jolts into gear.

Shiva Zen

Let's try some Shiva Zen. Ready? This will take about four minutes. Shut your eyes and, breathing in, sense your subtle energy (ki, chi, prana, or what have you) flowing up the spine. Up from the bottom. As the subtle energy reaches your head, it bursts into a golden or white radiance and goes simultaneously everywhere at once. This is Manifestation, or Creation. Your energy has become all forms, everything simultaneously, expanding like the post Big Bang universe. Breathing out, now, once you've reached the limit of your breathing in, feel the energy drop down your spine, to the bottom. Your golden-white energetic radiance, so explosive on the in-breath, is now contracting, sinking, becoming a zero point. Utter darkness. Utter stillness. Quiescence. No forms. No thoughts. Everything has now contracted into the tanden (ki-point, 2-3 fingers below navel). This is just pure and empty potential, consciousness without anything to think about. It's imageless. Yin. It's so wonderful, this Yin zero point when every phenomena has collapsed back into pure potential, isn't it? Some people want to stay here. But no. If you're going to live, you've got to breathe. So breathe in again. If you don't, your body will make you do it anyhow. Right? You're now breathing in again, the energy is going up your spine, forms are appearing, you'll see bits of dream, galaxies forming in space. It's all exploding from your head, especially just above the crown, in all directions. "Let there be light." Wonderful! A universe appears. It's fun to see the universe appear and disappear with your breathing. You'll also discover pretty quickly whether or not your personal preference is for "forms" or "formlessness." IN breath rises and expands infinitely. OUT breath sinks and contracts infinitely. In breath = everything. Out breath = nothing.

Pervasiveness of awareness

What is IT that's intensely aware of your body and its movements in space, yet mysteriously, when you look for it, is found nowhere at all? Put your hand behind you and touch the back of your skull. Feel the awareness in your hand. It is aware, isn't it? You can feel your hair. The awareness in your hand is now located a few inches in back of your brain. If it's the brain that's aware, how is this possible? You have just been introduced to the pervasive nature of awareness.

Unchangingness of awareness:

Let's try an experiment. Sit down, shut your eyes, and concentrate on trying to find your awareness in space. If it's in your head, what part of your head is it in? See if you can find the center of your awareness. Isn't it strange that your awareness seems to be as much "in" your chest, or shoulder, or feet, as it is inside your skull? Weird stuff. But even there, can you find the exact point where your awareness is? This is the interesting part: try bending forward with your eyes shut, concentrating intensely on your awareness. Now straighten, just as slowly, to your former sitting posture. Did your awareness move? Did it bend slowly forward when you did, then back? Try it from side to side. Lean back, all with your eyes shut. You're aware of all this, clearly aware, but is the awareness moving at all? If the awareness IS moving, does it move at exactly the same rate as your bodily movement? Does it lag behind? Or jump forward?

[END OF COMMENT]

That's really good - straight to it.

Zen isn't Sutric buddhism. You understand the Void not just with your brain but your whole body, down to the cleft hooves. In Tantra, this is called the Yoga of Spontaneous Realization. It is an ongoing and unending Enlightenment you don't need to name or grasp.

And an enjoyable read. For anyone who liked the exercises, you might like Rupert Spira's efforts, his books Presence Vol I & II are filled with one-chapter little experiments exactly like that - just questioning what your actual experience is. I put it in the reading list I think. Sample here. He gave a recent conference talk, transcript here [dead link], which is maybe worth reading to get the idea. Not quite so much fun, though!

POST: How would you detach from reality in an easy manner?

There's a saying in zen that would have helped tremendously for me to have understood at the time that says, "All fear is an illusion. Walk straight ahead no matter what."

I've never encountered that saying before, but it gets directly to the heart of it. Ultimately, if you want to have dramatic things happen, you have to "be okay with whatever happens" and not block the unfolding of the patterns you have made - you can't be re-intending every time an uncomfortable feeling or apparently "incorrect" sensory scenario arises. Doing so results in you "thrashing your world" due to repeatedly intending something then re-asserting the previous state once the "out of control" or "happening by itself" feeling comes up (which commonly accompanies change). The whole thing about "surrender" and "allowing" and "non-attachment" is really about the recognition that, although we might intend a specific target experience, we do not deliberately select the sequence of moments which arise between "here" and "there", and so we must give up to the mystery as the unknown path unfolds. Definitely a good question to ask ourselves is: Am I constantly unwittingly re-asserting my starting state?

Q1: *we do not deliberately select the sequence of moments which arise between "here" and "there", and so we must give up to the mystery as the unknown path unfolds. I like this, and it is true. But not give up to it in some manner of defeated surrender because we have no other options, but rather from an understanding that we ourselves are a mystery, and that there's no fear in mystery, or that which is mysterious.*

You make a good point about emphasising that it's not surrender in the sense of giving up, it's surrender in the sense of trust. You are giving up the fight, because the right thing is happening, so there is nothing to fight. To cover "starting state", let me reuse an example: If you are sat in a chair, and want to stand up, you should intend being-stood-up and let experience unfold accordingly. If you approach it this way, your body will feel like it moves "by itself" and there will be a sense of effortlessness - because no muscle movement is occurring other than that required to shift position. (If you are feeling muscular effort, that is the feeling of creating effort, which means you muscles have done their movement bit, and are now doing something else.)

However, what people usually do is being this be re-asserting their current position. They begin by locating themselves being-sat-down and fully establish that before beginning. They then try to overcome being-sat-down by intending their muscles "manually" in order to get to being-stood-up - which they do by keeping being aware of being-sat-down throughout. In effect they are continually re-asserting their initial state of being-sat-down as part of their strategy for being-stood-up. So, this is similar to people who try to make changes to the world in other ways, but do so by starting with the world as it is, or be constantly checking how they are doing by comparing where they are now vs the initial state (which simply re-asserting the initial state again, to a greater or lesser extent). This is really part of the broader problem where people try to be "over here" while making changes "over there", in space or in sequence. For example, wanting to fill the room with your 'presence', but attempting to do it while remaining firmly located in your body area, maintaining a mission control aspect. This can happen because people confuse being "detached" with being spatially located separate from the world. This is not quite what is meant. "Detached" really means "allowing".

I really dislike the langauge of surrender because for me it evokes something external whereas you're trusting your own process of othering

Yeah, I don't think there's any single "best" way to phrase it. The language for "that thing where you stop interfering which feels a bit like things are happening to you but they are the things that you have already created" is pretty tricky, and I'm inclined to think it just depends on who's on the other side of the conversation. For someone whose main problem is that they are constantly grasping onto their sensory experience, "surrendering to the flow" type imagery probably capture the feel of it. So long as the context is one of being assertive in other ways - in other words, the reason you surrender moment-by-moment control is because you've already asserted the outcome - then it cane useful. However, if it gives the sense of "surrendering to God's Will" without also informing you that "God's Will" corresponds to the landscape of your accumulated previous intentions and their implications (including any ideas you had about a "God"), then it's more problematic.

Some of this is unavoidable if you want to have a sense of progression.

I don't really mean this in the sense of extinguishing your notion of the past, or your memory. I mean it in a much more straightforward way of not re-asserting the current state, by looking for it or implying it. The everyday example is, if you're getting up from a chair to go into the next room, you don't being by feeling out with the senses to find the experience of yourself sat down, and then try to manipulate that experience into standing up. You think only the fact of being-stood-up and allow your sensory experience

to apparently flow towards that position.

Pushing this further, if we were to teleport from one room to another, how would that play out? We wouldn't be aiming to forget the memory of the room we started in, but we would be aiming to completely let go of the fact of being-in-the-room, to allow it to be replaced as a relative truth by the fact of being-in-the-other-room. So that's the sense in which I mean not checking or comparing. It's perfectly okay to spend some time contemplating how much you've progressed. But when you are actually performing a state-shift, you should not be checking on your progress by bringing up the initial state for comparison, because that re-asserts that initial state again. You keep finding yourself sat down in the chair / un-teleported again!

Firstly, I want you to remember that I still continue to respect your opinion. Nothing has changed in that regard.

Likewise! Your last response is on my list, so don't regard my delay in replying as anything other than me wanting to mull it over for a bit, because I think we ended up talking about slightly different things (releasing the current state vs releasing accumulated progress over time).

Quick thoughts: There is nothing stopping you skipping from one "frame" to another in my description, other than refusing to release your current state, or somehow re-asserting it. By "refusing to release your current state", I simply mean not continuing to assert aspects of the current frame (sensory aspect or implied pattern or fact), so that it can shift. You can't stand up if you keep focusing on the sensory experience of being sat down. The essence of a "patterning" approach is that there is no permanent solid structure at all, even though we have built up some habitual structure over time. If you look at the grid metaphor animation, for example, the starting and ending frames are totally disconnected. All potential frames are simultaneously available and accessible.

The brutal simplicity underlying all this is: You are an "imagination space" - that is the context. Sensory experiences arise within it, via patterning - that is the content. There are no restrictions on content. Changing the content means intending-imagining what you want (basically: intensifying the contribution of a pattern) while not intending-imagining something contrary to it, and hopefully not something that limits the manner it can appear to manifest by. Everything beyond that simple account, is a description of specific patterns which we already have, or which have benefits if we format ourselves with them. This is the idea of "Active Metaphors" - you intensify a metaphorical pattern, and your ongoing experience starts to align with that metaphor. So if we wanted to have the experience of teleporting, then for sure we could just intend fully and do a "frame jump", since there is no fundamental underlying mechanism to things other than intending-imagining them happening. However, another approach is to introduce into your world a mechanism or fact, to make it possible as part of the content of your world rather than an exception or jump outside of it - e.g. the "infinite grid" or whatever.

Looping back to your points:

1. For convenience, a "frame" is just any particular sensory arrangement. So it doesn't really make sense to say that a frame would be flexible internally - because that would be another frame. (Remembering, though, that the concept of "frames" is just a handy metaphor; experience is not really arranged that way, although it can be formatted to behave "as if" it were.)
2. Think I've tackled that above. There is no true model of reality. However, models can be useful for coming up with ideas for "as if" experiences.
3. I agree with what you say about "confidence". Really what one wants is to fully be the entirety of content and then shape-shift. There is no technique to that, and it is always true anyway, however we can get stuck imagining-that we are not this.
4. Stuff like "letting go" is just one way to relax the division and settle out into being the entire space and all that's within it. It's not letting go of control as such, it's letting go of (spatial) attentional focus and, counter-intuitively, becoming fully attended as a result.
5. It's also letting go of re-intending the current state, to allow yourself to shift. I say "also", but in effect the two turn out to be the same thing. Holding onto attentional focus is one of the last ways, having allowed body and thought to flow, that we subtly restrict our shifting of state.

Okay, I ended up typing a full response there, but perhaps it clarifies where I'm coming from and how it connects with your comment.

Don't you ever get scared? Do you ever get overwhelmed by experiences being much crazier than you bargained for?

I probably do feel scared quite often, just in everyday life. Or maybe "nervous" is a better word. Generally though, I find unusual situations - those which reveal things to be not as they seem - to be comforting rather than scary. Although it wasn't my conscious aim in exploring these things, when I reflect on it I think that the mundane version of the world would actually be much more scary.

So, I was probably quite a fearful child I think, and to some extent that stayed with me, but a counterintuitive side-effect of it has been that I've always been good for emergency situations when things go wrong - because I was comfortable with an ongoing sense of discord anyway. Unflappableness derived from baseline flappability? :-)

For "this stuff" - mind and reality - I was interested in it from when I was in early high school, so I started playing with stuff like astral projection, did that thing of being super-scared of the onset of the experience, eventually committed to it. Over time you accept the fear as a feeling that comes up, and later when you have a sense of being-the-context as your identity you are more okay with the content that comes up, because it's within you rather than something external coming at you. So what's important is finding new moorings after unusual experiences have cut the ropes on the old ones. And being okay with not-knowing - the inherent mystery of not having pre-experience of your upcoming experiences - while also having confidence that intention is effective. You still feel the feelings though. You're still having a "person" experience. But it's more like ripples in an ocean, rather than disturbances in a glass of water. You know, something I was pondering lately: I think it's quite common for people to think that they want a cool "glitch" or a "manifestation" - until they get it, and then they're suddenly not so sure. There is an anxiousness that comes with it, the anxiousness of intuiting that there is potentially no inherent stability or boundary? How would you phrase it?

The implications of "high weirdness".

- The world is not a "place". That's a pretty scary thing to realise. Anything might emerge from the "gloop"!
- I am not a "person". That's troubling too, initially. The stable foundation I thought I was, has no solidity!

Without anything to replace those two negatives, we are left with just The Unknown without any sense of trusting, and that can be scary. So the story of being okay with being scared, is to have a replacement for those? When you get a fear response with "reality" stuff, what sort of thing is it that you find shakes you?

EDIT: Comment length is because I've included a couple of quotes, to save having to read through the linked content.

Stacked Weirdness & Power

I was feeling like I no longer knew what reality was, what was real and not, and then I started to get scared. Then I backed off toward normality again.

I think knowing that one can pull back is a definite advantage. It's an option we want - "the right but not the obligation". At least then we can experiment and still feel safe. There is an issue that once you've allowed a level of weirdness to happen, it does tend to multiply and become dominant. It's not like you've tweaks a specific event, so much as adjusted a generalised fact, like having ticked the checkbox called "Enable Hyper-Associative Events" on your Life App, and the corresponding fact-pattern is now overlaid upon all experience. In general, I'd say the more we react to a pattern, the more prominent it becomes. It doesn't really matter whether that's a positive intention or a negative reaction - anything that focuses on or even implies the existence of the pattern, intensifies it. And so we get that guy over at Glitch who had been fighting the ever-growing instances of "11:11" for decades, not realising that anything he does about it will persist it. This is the real danger I think: that if we don't twig, then we can end up battling against something we've triggered, and get swallowed by it. I had a dream once, where I was floating in the void. I came across an infinite invisible wall. I pushed and pushed and couldn't get past it. It started to feel very claustrophobic and unbearable. Finally, I took a step back... and just walked through it. I think that dream was maybe trying to tell me something at that time! :-)

It's not as though I suddenly become more powerful myself.

In what sense do you mean, "more powerful myself"? If you are looking for the experience of feeling yourself "do" reality shifting things, then I'm not sure you are going to get that, since intention itself is effortless, and you sort of are the whole of everything. Or do you mean just having a more direct sense of the impact of your intentions?

I feel something shifting inside me. It's like, "Oh... I used to feel like that.. but now I don't. Hmm..." That's the best I can describe it.

Ah, that's really interesting, particularly what you say about the less you need to make deals, the more powerful you become inside. As a general approach, I think it's very good to, when you realise you have attributed power to some "outside" imagery, to intentionally draw that back into yourself (metaphorically, but also that's not a bad way to imagine it).

You mean not a human. You're still a subjectivity, which is also a kind of person. Just not a human or conventional person.

Yes. I think the phrasing of "not a human" sounds to a lot of people like we are claiming to be something else, like "non-human", but I like that term "a subjectivity" - it's similar to "a perspective" but without the implied point of view aspect.

Fear of the Unknown & Dreams

Like for example that dream where I felt things got so real that if I didn't wake up, I'd be dreaming it as my life instead of my old life... I guess unknown can be freaky if you expect yourself to have some needs in the near future.

That was a really good example and description. So, it's a variant of "not knowing how the world works anymore" and the fear that comes with it. This can happen both in "this" world when weirdness starts happening (even when that means getting something we want), and in the "other" worlds of dreams and projections when we have no accumulated knowledge. I think perhaps we can prepare ourselves for this in our daly lives, and it's about building up confidence in something we rarely use. It doesn't necessarily required weirdness, but a sort of openness, in order to answer the question: how do I survive in an environment that I don't (think that I) know?

One of my little experiments used to be, to ask my body to go and find things, and then let it move by itself. The mild version of this was, to just ask to "know" where something or someone was. If I was late meeting up with friends and didn't know which bar they were in on that street, I would just ask my body to go to where they were. In both cases, you are intending an experience and then allowing it to arise - whether that's the experience of an action or the experience of a thought. How does this work? Well, if what you are is really a "subjectivity" who is currently having the experience of being-the-world-from-the-perspective-of-a-person, then all facts are available and all events are possible. One simply intends an experience, and allows it to unfold as overlaid upon the currently active patterning.

A couple of examples in the dream world where one draws upon knowledge implied by the situation, via intention, deliberately and not:

However, in order to progress in your dreams you will occasionally need to make a leap of faith. Make sure that you take them sparsely, and that intuition is on your side. I started walking into a direction that took me away from where I previously was. Putting my focus on something else put my body into auto-pilot. In this case I got the idea of the key being for my spaceship mid-way. (Spaceships use ignition keys, just like cars right? cough)
My body automatically walked me towards where this spaceship is, even though I did not know where it was. Somewhere deep within my thoughts I knew that I had gotten to this space station somehow. If the key indicates that I own a spaceship, then I would have arrived in this spaceship, and I would also remember where I parked it. Putting myself in "autopilot" I can walk to locations that make sense for me to know within the dream plot, even if I don't consciously know where they are.
-- From Hyu's guide on Persistent Realms [<http://www.dreamviews.com/blogs/hyu/persistent-realms-other-lucid-dreaming-techniques-i-use-39218/>]

and:

We went outside and he gave me the strongest bear-hug I've ever experienced. I couldn't breathe and soon became unconscious. It was like waking from a dream; this world was a dream and I awoke to a reality more real and vivid than this world is. I saw the illusion of this existence on Earth dispelled! It faded away and I didn't regret it. Soon I found myself in the "real" world in a huge city that I already knew. My memory seemed to return--Yes--I had gone to sleep and dreamed of a little place called "Earth" and now I was awake. "That was a silly dream" I thought, and I soon forgot all about "Earth." I continued my life, just like before I fell asleep. I lived in that fantastic city for years and years--centuries it seemed. I lived there so long that I COMPLETELY forgot all about Earth. For hundreds of years I had forgotten Earth. If someone was to ask me about it, I couldn't remember, since it happened so long ago. Then one day I was walking to a store. Suddenly a confusing loss of direction hit me and I felt myself falling. Suddenly I opened my eyes only to see strange leaves, the sky and FD and the other boy looking at me! Where was I now? How did I get here? What happened? Then I remembered: Hundreds of years ago, I fell asleep and found myself here. This place was called "Earth" and was a part of a weird dream. I must have fallen asleep again. Slowly my Earthly memory returned. I asked the boys how long I had been unconscious. They said only a few minutes. They asked me what happened, and I told them I didn't want to talk about it.
-- From Robert Peterson's OBE guide [<http://www.robertpeterson.org/chap02.html>]

In other words: we do not need to fear the unknown. Just because we have not explicitly thought about the knowledge, recalled it, does not mean that the "right action" is not available to us. In fact, right action is always available, because we never truly act, rather than intend or imply outcomes and experiences arise in line with those intentions. We can surely confirm this for ourselves in non-challenging everyday life and develop a confidence for fun, before putting ourselves in any situation where this would be required for survival?

Q1: I think knowing that one can pull back is a definite advantage. It's an option we want - "the right but not the obligation". At least then we can experiment and still feel safe. There is an issue that once you've allowed a level of weirdness to happen, it does tend to multiply and become dominant. It's not like you've tweaks a specific event, so much as adjusted a generalised fact, like having ticked the checkbox called "Enable Hyper-Associative Events" on your Life App, and the corresponding fact-pattern is now overlaid upon all experience.
You're onto something here. Even with my ability to return back to normality, I feel there is a limit. It's like if I am walking into an ocean, and I can return at will so long as I don't wade more than say 10 feet away from the shore, because if I do, the waves and my inability to touch the bottom will potentially make it impossible to get back to the shore by foot. Then I have to swim. If I know how to swim, I can remove myself further from the shore before fear sets in. But if I swim so far that I no longer see the shore, the fear is back. Then I might know how to orient myself by the sun or the stars, but if it's dusk and cloudy, the fear's back. Etc. In other words, each new level of skill extends the safe range, but each type of skill has a limit. And, there is, I feel, something like a point of no return. I haven't gone over that point yet, and so I can still return easily and at will. Which is nice, but it's not that great of a comfort. I think ultimately we can return to anything, but what's not always assured is the easy and quick return.
In general, I'd say the more we react to a pattern, the more prominent it becomes. It doesn't really matter whether that's a positive intention or a negative reaction - anything that focuses on or even implies the existence of the pattern, intensifies it. And so we get that guy over at Glitch who had been fighting the ever-growing instances of "11:11" for decades, not realising that anything he does about it will persist it. This is the real danger I think: that if we don't twig, then we can end up battling against something we've triggered, and get swallowed by it.

Meta-beliefs, beliefs about beliefs, have power. If you believe that interacting with a belief or an representation of belief in any way reinforces it, then it may be so. But that still doesn't mean it is universally so. It is so only provisionally, contingent on that meta-belief.
In what sense do you mean, "more powerful myself"?

When I open my heart door to allow more weirdness into my life, it always comes through the veil of othering. I feel like it's happening to me, and not like I am making it happen. I allow it to happen, but from that allowing forward, I am no longer in control of how, when, where, the details. So if I open my heart door right now, then in the next week a series of weird events will unfold, but I don't know how, when, where, etc. And when they unfold, I don't feel like I have a choice about what it is. So this is a very powerful othered intent. Heavily othered.

If you are looking for the experience of feeling yourself "do" reality shifting things, then I'm not sure you are going to get that, since intention itself is effortless, and you sort of are the whole of everything. Or do you mean just having a more direct sense of the impact of your intentions?
My intent has an inconceivable range. If you can imagine something, I can intend it. So for example, you often talk about yourself as though you're not acting in a powerful way, but are just watching your body act something out that you yourself don't think you can do in the body. But I've experienced power far beyond this. I can act as God. I don't need to play tricks with my body. I've erased and created universes with my body. I remember these things. So I know I can wield arbitrary levels of power in arbitrary configurations. I don't have to play tactical games. I often end up playing a tactical game similarly to what you describe, but that's only because there is an interfering belief with its associated life-pattern that I'd rather go around than face head on. So for example, if I believe my in-body consciousness is dumb, I will tactically remove myself from the body and put my body on autopilot. That's how I go around the bad belief. But there is a way to remove the bad belief directly. And of course I don't mean the belief is bad in an objective sense. So if you see such a belief as overall good, it may actually make a lot of sense to use all these tactical intentions to preserve those structures that perhaps otherwise serve you really well. So maybe it's great that when you're in the body you seem to be deaf dumb and blind, and when you want to find your friends, you separate from the body, disown it, temporarily, do your trick, and then you're back to the excellent deaf dumb and blind in-body state as before. I'm playing a slightly different game here TG. I don't like tactical stuff except as an intermittent reliance. I am more likely to accept a tactical intent if I myself thought of it. If someone else (including you) tells me "here's a tactical intent and it works because that's just how it is" I reject it on its face. In Daoism the tendency toward tactical intentionality is

sometimes called "scheming and plotting," btw, and Zhuangzi talks about it often. I'm not a Daoist, and I actually don't give a rat's ass about Daoism, but it's a very similar understanding to mine. Tactical intents, if they're up against something unconscious, they spell trouble. And usually we need to use a tactical intent precisely because there is something unconscious that's sustaining a pattern.

Just because we have not explicitly thought about the knowledge, recalled it, does not mean that the "right action" is not available to us. In fact, right action is always available, because we never truly act, rather than intend or imply outcomes and experiences arise in line with those intentions.

I think this is very true, but it's one thing to say it, and another thing to enter into this truth with, as they say, your very body. I very much appreciate your brilliant post TG, but it's not as though suddenly everything is obvious and easy to me. Not yet. I'm still going along the same path as before.

So, much of interest there (and your paddling and swimming imagery was nicely evocative). I'm thinking that perhaps they can be seen as pointing to a single idea perhaps, which also takes in that option to reduce our needs rather than fulfil them (or as a way of fulfilling them). It comes down to this idea of the "tactical" move and of "power". I'm gonna riff on that a bit -

I suggest that there is only one mechanism, only one thing that ever "happens" - and that is intending. Even the apparent actions and events that occur, they are not "happening", there are (metaphorically speaking) aspects of a landscape that is static between intentions. The experience of "time passing" is itself a static pattern. This means that there's no such thing as "tactical" this or that, and no variation in levels of power - because all that there is, is the "nuclear option". There is only one way, and that is the pressing of the big red button. Every intention is a reshaping of the landscape, and therefore in effect the complete destruction and then creation of a world. There is no path to power; the fundamental truth of the matter never changes. Having the experience of "feeling powerful" - that is just another sensory experience, and has nothing to do with power as such (except in the sense that one uses the true and only power in order to generate an experience of "feeling powerful").

Yes, I'd agree that if you can imagine something, then you can intend it, because imagining is an intending really - an intending of the experience of an image - and only a small adjustment is required to make it "real" - to intend it 3D-immersively rather than in a separate strand of thought. And this leads us to an important point I think... What we intend is always to have experiences. Our intentions correspond to generating experiences "as if" things were true. Experiences themselves have no causal power - one moment does not cause the next moment, they just arise sequentially is all - so there can be no tactical or developmental strategy. You have intended an experience like "this", or you you have intended an experience like "that". The content of experience is itself actually irrelevant, other than personal preferences. What we are, is the context of experience - and having recognised this, we are freed from concerns about power, mechanism, and so on!

Sp, we may desire the experience of feeling ourselves "doing" our events, rather than experience them "happening to us", but it will just be another experience. Intentions are always "global", even though experiences may be apparently localised. Knowing this, we have a choice, and that is what matters. We can have... fun. If we switched our experience to one of "seeing the entire landscape" rather than just a partial view, then we'd be having an entirely static (although blissful) experience. We'd get bored pretty quick... except that there would be no time, so that makes no sense. :-)

Q1: Your explanation trivializes and glosses over a lot of important aspects. That's why I cannot accept it as is. All I see here is a potentially powerful way of looking at intent. It's useful, but I already explained at length why I am not pleased with this manner of thinking replacing every other type of thinking. I understand exactly what you're talking about. I have no idea why you launched into this big explanation, because I don't think I've gained anything new from it. It's basically a rehash of what you explained before. Well, I got your explanation the first time around. If you don't believe me, go ahead and quiz me on it. I think you're missing a lot of important detail this way. It's like painting with just red. Well, if red is your favorite color, should you paint everything red? I don't think so, personally. I think actually most times people want to leave the base alone and perform a local change. It's like dancing on the stage. You don't want to alter the stage with every step. You want to dance on it. And of course, there is a way of doing that. First you have to conceive of the stage as remaining constant. That helps. So, what you're talking about helps to make big jumps, but it's useless for any kind of detail work. On top of that, it's completely bogus anyway. Nothing is static for a moment. There is no infinite grid as such. You're just imagining it. Now, if you want to use your imagination that way, that's one thing. But when you start saying this is how it is, that's different. Then I say, no it is not. You're talking about one option, and not how it is. Personally I even like the option, but I am not in love with it.

What else is there, except for intention? There is no other method or mechanism - it's all sensory theatre. It doesn't matter whether it's small or large changes, moving your arm or moving a house, you are always intending: "intensifying the thought that something is true". For sure, the "infinite grid" is imagination - but so is "the world as place" and anything else we can conceive of. That is the such-ness of things, and everything exists always. It's just a matter of how prominent that particular imagining or pattern is in our experience. Relative intensities of contribution. The world is ourselves as aware imagination itself, shaped into a particular form - and intention is the reshaping of ourselves. So I'm not saying that the "infinite grid" or whatever is how things are - the opposite really. I'm saying there is no fundamental unchanging "how things are", other than ourselves-as-awareness taking on the shape of a state. Anything beyond that, is the form we have adopted. Fundamental truth (context) vs relative truth (content). And we are free to shape ourselves however we want. However, this does in effect mean we are always using the nuclear option - the full power of God, as it were - because there is no other option. When I interrupt the flow of things and move my arm, I'm just intending the fact of arm movement, but actually I move as the whole world in order to do so, since there is no separation. The process is always: I shift state as a whole, and my subsequent sensory experiences arise from the new state. And of course the world - as in, the complete description that constitutes its state - is static between intentions, between reshapings. If it wasn't, then that would imply there is a power outside of ourselves, even though we have no outside!

So, to emphasise: This isn't about the any particular approach we want to experience ourselves apparently doing; it's what underlies all apparent approaches - our nature. Beyond that we are completely free to do detail work or broad shifting however we please, for the simple enjoyment of it. (Knowing that all approaches are basically optional, chosen because they fit our views at the time, how comfortable we are with them. After all, there's not much point making changes for the sake of it - the purpose is to have fun or otherwise increase the quality of our experience.)

Knowledge. There are different ways to conceive how experience should be structured.

Knowledge, I would say, corresponds to an aspect of "state", as distinct from intend-ing would be the change of state. Beyond that, of course, everything's up for grabs. How would you define "knowledge"?

In some sense you always use the most powerful capacity of intent, but that's generally below the level of conscious awareness.

Well, that's quite the thing isn't it? You don't experience yourself intending as such because intending isn't a thing, and an intention isn't a thing but an aspect (although once can use an object to represent an intention). If you aren't "looking" at the part of the world you are shifting, then you won't experience anything - other than sort of very slight felt-knowing.

You seem to ignore the relative problems that human or recent ex-human beings have. You can't answer a real life problem with theory.

Well, it does answer problems in the sense that it shows the relationship between aspects of experience - importantly, it highlights that no structures are solid, and that cause is intention and not in the content of experience - but then we progress to specific examples to illustrate this. I'm not sure what exactly your objection is, in terms of how it would relate to life and making changes? The base notion is of course just "relative intensities of facts = state ==> sensory experience". The conclusion is that you don't need to worry about mechanisms and techniques, except in the sense that you imagine-that you are doing something causal, then you are, and that if you decide something means-that another thing is true, that is cause. But nature of that cause is "the thought that something is the case". After that, it's playing with examples, to demonstrate that causal/acasual mix.

If you teleport somewhere, the me that you'll meet there...

We actually just can't talk about that - it's meaningless to talk about "the you" that I will meet, right?

On fears, they really have to be tackled specifically. There's the general fear of change, which I think can be answered by recognising our true identity as the context of experience - but specific fears depend on their relationship to one's identify, I'd say, so there's some unpacking to do, unless you just commit to an outcome. Eventually, it's the story of developing trust?

This I think is a much more insightful way to look at intent.

That is an example of an intention. I've been talking about intention more generally, and the implications of its nature on our understanding of the world, and how we would operate within it - or may operate it. Although I seriously hope you don't actually operate that way! ;-)

[Knowledge] It is a mental form assumed with confidence and familiarity.

Hmm. Is that not an experience of knowledge? What is knowledge's actual form?

And I found it profoundly unhelpful. It does not assuage any fears at all.

It seems we are talking at cross-purposes a little. I wasn't particularly aiming to assuage your fears!

But I would say, the only truly reliable, global way to deal with fears is to re-identify yourself as the container of experience. For as long as you're identified with a particular aspect of experience, of content, then there will always be fear of change, change that modifies it or dissolves it. The unpacking we do, I feel, is really us taking baby-steps towards that. Which is totally fine!

On trust - you could say confidence, perhaps. Really, it's faith that your intentions shift the world, and that even though you might not experience the outcome in the senses for a period of time - during which sensory evidence might even be counter to it - and you don't know the explicit trajectory in advance, that it has "worked".

Obviously, in the longer term, I do aim to assuage all your fears! :-)

Picking up on a couple of points which are key:

[Although I seriously hope you don't actually operate that way!] I do! And I suggest so do you.

What I was getting at there: I really hope you don't manually micro-intend your body like that, or your thoughts, or anything - because you don't need to do that. If you intend an outcome, the rest is autocompleted. This is how we can insert "facts" and have the world fall into line. This is how we can be effortless. But...

It's also why you need faith. We may call it confidence built from experience, but you must eventually become comfortable with the fact that you do not "pre-experience" your experiences. If you intend an outcome, you will not know in advance how exactly that outcome will seem to come about. (Even if you did a "psychic preview" you would be experiencing.)

I get the impression sometimes that you see yourself as the ongoing controller of your experience. Now, you can adopt that approach certainly, but it really limits you to your immediate sensory theatre (as it were) plus what you unpack into your thoughts deliberately, rather than the world as a whole.

[Knowledge] Why does it need an actual form?

It doesn't, necessarily, but if we don't explore the question, it's left as a nebulous idea which isn't bound properly to our ongoing experience and to our "power".

I know all about the global teleport idea...

Well, it seems that you don't entirely get what I was saying, because you said that (for example) the infinite grid was "just" my imagination, which rather begs the question as to what the world is, in contrast, and so on.

[Baby steps] That's how any real change happens.

It returns us to the "do problems solve themselves?" topic. If one intends an outcome of a solution, then does one solve the problem or does one experience the problem unfolding into a solution. The difference is probably whether you try to control the process - micro-intend the steps - or whether you let you attention flow across the determined path. It's probably time to get back into details. Perhaps we could consider:

- If you are sat still just now, and then raise your arm. How do you conceive of that as happening? What is your description of that? (And then how would you relate that to more "magickal" intentions - same? different?)
- What would you say your most persistent fear as regards oneirosophy, from a conceptual point of view or a daily lived point of view? (Which probably are the same thing, maybe?)

Going somewhere isn't the point. I want to avoid the puddles. I can control each individual step then.

Hopefully puddle-avoidance would already be built in...

Knowledge is different from pre-experiencing. For example, I know I can get to the store by walking in this and that way. I don't need to visualize the street. I just know.

You are inferring knowledge from the experience that arises. Which is potentially a different thing to "knowing", although we might say it is a part of being - a particular state.

My point is, we're all doing it ... unless you want to tell me you experience no limitations whatsoever . . . You're not always teleporting. If you were always teleporting, you'd experience no limitation of any sort, ever.

You're conflating a couple of things here. If to-intend is a reshaping of ourselves into another state, then that state is not necessarily radically different. However, all intending involves - is - a state change, a teleportation, we might say, from one configuration to another. However, the "formatting" of our state comes into play, as we've discussed before. If a particular fact or pattern is prominent in its contribution to experience, then it will continue to do so unless directly addressed, or another intention implies that it no longer applies, or we withdraw our participation with that pattern. For as long as "the world is a spatially-extended place" is a dominant pattern, then intending "go to the shops" will tend to map out a experiential path of "walking there" rather than "appearing there". But the 'mechanism' is just the same: you don't "do" the walking, you intend the outcome "being at the shops" and that pattern is overlaid as fact, blended in with other patterning, and we have a corresponding sensory experience. This what the patterning model is about: The only fundamental truth is that you are an awareness in a state. The state can be conceived of as consisting of relative intensities or contributions of fact-patterns. Intention changes the state and hence sensory experience. Nothing is ever "done".

You can piss about with "fear" and "expectation" all you want, but then you are just circling the direct nature of the thing.

I explained the problem with the limited grid. It's just your imagination because it admits the problem I explained to you.

Hmm, not really. The grid is a configuration space pattern. It does not necessarily imply that every intention is a radical "frame-jump" - it simply says there is no inherent restriction in terms of triggering discontinuities in experience, and that each moment is fresh and disconnected from the previous one. It's actual use is to help shift ourself out of the "world is a spatially-extended place unfolding in time" formatting, relatively speaking. Because imagining something is intending is reformatting.

Not at all. There is more to it. It's got to do with one's expectations, fears, etc. So if one doesn't want to, or wants to, but feels fear, that's an interesting moment.

Those are very fluffy concepts. What is an expectation? What is a fear? Without addressing that, it's not an "interesting moment". It's a distraction from understanding. You can end up just implying their existence, persisting their ongoing influence in your life, if you don't have a larger context within which to place them. But really, the heart of it is this:

- If you wanted to make something true in your experience, how would you go about it?

There's nothing else really worth answering, in a way. It doesn't really matter what the particular "something" is. If that question can't be answered, then it's all just theatre, no power.

You take frame A, where the world is spatially extended, and jump to frame Z, where the world is also spatially extended

The difficulty is, that while you conceive of the world as being a "place" and yourself as an object within that place, you are formatted against discontinuities. Not just "teleporting" - which I use as an example for discontinuity that's easier to grasp than other more general facts - but any shift that involves not having a stable substrate. Now, there's nothing special about metaphors like the "infinite grid". Like all structuring metaphors, they are simply useful for conceiving of a change, and for creating an apparent path for that change. It's a case of imagining-that something is true or possible, the better to get to our desired outcome, right?

So let's not get hung up on content itself as being "really" true, which seems to be what's happening here.

[Fear and Expectation] I can explain those, and I have, but you didn't engage.

Want to give it another whirl? Because you didn't explain them, as far as I could tell. What I'm reaching for is: if there is fear, to what extent is that something more than an occasional feeling? What else comes up? And then: does fear need to be tackled on a case by case basis, or can we just shift perspective and render it powerless. The feeling might still arise, perhaps, but the meaning would be transformed.

I can explain that. It would be a very long explanations.

Why would it be long? Because it's hard to describe? Or because it's an involved process?

Surely the basic idea must be super-simple because, in effect, it's going to be all that ever "happens" - and it cannot be made from parts. (Which isn't to say that a particular experience of doing it can't utilise the idea of parts.)

You're starting to understand the weakness of your grid model.

Ah, I see. This explains some confusion I've been having with what you've been saying. Actually, the infinite grid thing isn't my model for experience, it's just one way of conceptualising or formatting experience - one pattern overlay amongst many. The base model is "patterning", but of course even that is...

is NOT the truth of what happens

It can be a truth - relative truth - of what happens, but it is not the truth, which is simply that we are that-which-imagines-that things are true and has corresponding experiences. The interesting thing is to find models or "active metaphors" which have useful aspects, and intend them into prominence, such that your experience unfolds "as if" they were true. In this way we make the paths more flexible - the more abstract formatting - rather than just intending outcomes and the path (the sequence of moments that arise) being "plausible" in that everyday way.

Of course, fundamentally we are just dreaming of being in a world with the properties that it seems to have, and there's nothing "behind' it. And this is why we get to ask ourselves: if we want to radically change the content of the dream, does it make sense to perform dream actions to do so, rather than dreaming the world differently? Dreaming of "doing something which will bring about that result" and dreaming of "things being true" are two approaches, but they are really the same approach. The first is format-bound, the second address the world-format issue directly.

... since it leaves out crucial info.

What is that crucial info?

I think the only crucial info, is that we can directly experience ourselves as the formatted space in which experience arise - know it by recognising we are it. Without that understanding, everything else is wrong. It may be self-consistently correct, but it will be fundamentally wrong in a sense.

Truly large fears are tacit. They're ever-present, but hidden from view.

Okay. How does this help you?

I have to do introspection. It's serious business. As in, yea, I have to like pause what I am doing, stop typing and just be quiet for a moment and look inside.

Okay, so I'd say this is a simple process - in the sense that what one seems to do as context is straightforward - but also complex - in the sense that content tends to be very complex. (It reminds me of Eugene Gendlin's A Process Model, although I don't necessarily recommend wading thought that. It also doesn't go into "the world", more treats it as personal psychology, but it does provide a structured description of introspection.)

Of course, this is where we get into examples, but regardless of the specifics, I think we can still take the important step of not identifying with any particular content which we encounter. We also have to be careful that the concept of their being a "something" that is persistent and exportable is itself a patterning of experience. Whenever we intentionally go about the activity of "finding things out" or "changing things by interacting with them", we are also implying that such things exist, generating the corresponding experience. So it can get tricky, and that's once reason to explore direct assertion rather than interaction.

(Let's pick this up later. "Fear and process" seem like two interesting strands to discuss. I think our model-based exchanges have been based on a misunderstanding of what was being said.)

...

Q2: *If you are sat in a chair, and want to stand up, you should intend being-stood-up and let experience unfold accordingly. How does one go about intending to do this? And intending in general? I feel like this has probably been addressed on this sub before but don't remember where. I read your piece about lying on the floor and intending to get up but didn't quite get it there either.*

We hit the limits of language and metaphor here, because "intending" isn't a thing or an act, since that implies a doer and a thing done. But that's never stopped me typing away before, and it won't stop me now...

Intending vs Sensory Theatre

Firstly, you should view all of your sensory experiencing as a result. No part of a sensory experience causes another part of a sensory experience. If you feel yourself moving your arm - maybe a verbal thought then a muscle tension then an arm movement - you need to recognise that all of that was a result, and none of it was the intention.

- Intending has no sensory aspect.
- If you experience a sensory outcome, it is arising as an implication of the intending.
- You cannot experience yourself intending as such.

"Intending" can be viewed as you changing your state - where "state" means the current distribution of patterns and facts that constitute your world, dissolved into the background of your experience. One way to think of this, is as a landscape whose contours are the facts and patterns. Your ongoing sensory experience then arises, like a mirage, from this landscape. You cannot change the mirage itself, all change is indirect. You change your landscape-state, and subsequently all your experiences will be aligned with that state.

- Your state is the 'cause' of all your experiences.
- It consists of all possible facts and patterns, at relative strengths of contribution. It therefore implicitly defines the sequence of moments that are queued up into the future.
- All change is indirect and is a change of state, a change of the relative prominence of certain facts and patterns, a redistribution of the landscape. "Intending" is what we call changing state.

"An intention", then, is what we call the pattern which we are going to emphasise in our state. It is like an unbounded non-sensory thought, a dimensionless fact. Emphasising such a fact involves a literal and direct reshaping of this 'landscape'. Basically, a reshaping of ourselves. But wait - if we only sensorily experience something when intending if the intention affects the part of the landscape we are currently "looking at", how do we loop this back to direct experience?

Mostly: faith. But for the purposes of exploration, we cheat. Although we can direct without any sensory theatre, it is easier initially to use misdirection and create an experience of doing something, but have that "doing" not interfere with what we are trying to accomplish.

Back to the Chair

When people get up from a chair, they typically use misdirection by intending muscular tension (an experience of "doing") and during that the intention of standing up occurs. But in this case the misdirection and the desired outcome are opposing one another. Instead, let's have our experience of "doing" be independent. We sit in the chair, and we place our attention on the background space of the room, and we decide that by focusing on the background space of the room, our body is going to stand up. Rather than intending that "tensing my muscles means-that I will stand up", we are intending that "focusing on the background space of the room means-that I will stand up". Of course, one could simply non-sensorily intend the fact that "I will stand up" (the "just-decide" approach), but actually the "assignment of meaning (or causal power)" approach gives you a good experience of a general principle. That is, that intention is always the true cause even though it cannot be sense.

Once you've played with the background space example, you can try "looking out the window means-that I will stand up". Then, "saying 'stand up' means-that I will stand up". And penultimately, "being here in this position right now means-that I will stand up". After that, you are at raw intention, and are in a position to extrapolate your new understanding of causality to your experience of the world more generally.

Was that a sort of intending that I was doing or was the energy already there being unleashed from the awakening I was going through and I was just overlaying unnecessary imaginations on top of something that was already happening anyway?

I'd say that you were imagining-that something was true with conviction, and your ongoing experience was patterned accordingly. There was no energy "out there" but it is enough that you have an idea of "energy" and imagine yourself accessing it. You committed to your own logic, and everything else followed. In terms of the parent comment, you were "intending" a situation as true by implication, and then experiencing it. (You could have directly asserted what you wanted without any of that "sensory theatre", however it's much easier to allow something to happen if you think that it "makes sense" somehow.)

What your awakening did, was free you up from your habitual patterns, crack you open. and make things more fluid in terms of what could be asserted or implied. Although, as you notice, you can make yourself quite unstructured quite quickly if you're not careful - basically, put yourself into a manic mode!

For some reason the idea of there not being any challenge at all seemed to take the fun out of things.

Indeed.

So you can directly assert something by simply just-deciding that it is true. This amounts to assigning fresh meaning to the current experience: "my current situation means-that this is true", which is equivalent to "my existence means-that this is true". All perhaps without any sensory aspect to it at all. But as you've noted: where's the fun in that? Because where that would end up if we pursued this fully, is with a completely disconnected experience, just like everyday casual associative thinking or just random hypnagogic imagery. Getting bored, we would once again allow that imagery to coalesce into a scene and then an environment, just like the beginning of a dream, and we'd be in a world again. Although this time we know its nature.

Understanding this, we can skip that process.

So, overall, once we have the idea that the only causal power is ourselves as intentional state-shifters, this frees us from our limited concepts. Strangely, one of the benefits of the realisation is that we no longer have to burrow down to the fundamentals, because we've recast all experience and so can be high level again - while retaining our updated perspective. Basically, be more playful, treating ourselves and the world within us as "all imagination" and all imaginings as facts at different relative levels of intensity or contribution.

Totally, this is where things start to get really fun, I think. With that said, have you noticed that things seem to unfold in more novel and amusing ways than the way in which you initially imagined them, or even could have imagined them at the time?

The world, it seems, does have a bit of a wit about it, it's true!

POST: Sensoria vs visualization.

Another good question is, why is it so easy to imagine your dream world? Not this one, your sleeping dreams. That also is imaginary.

Yet, it's completely without effort. I was talking about this elsewhere, intention + automatic pattern completion, copy-pasted below. The point is, you shouldn't be doing much of anything with your conscious mind except "requesting" - effectively raising a part of a pattern, which then naturally "raises" the rest of it. Excerpt:

Good point about "allowing" imagination/results. I learned visualisation from David Fontana's The Meditator's Handbook which basically amounts to:

- Regularly try to visualise various objects and environments.
- Eventually realise that it's not "you" that creates the images. They arise in response to you intending to have them - if you allow this to happen.

Relevant quote:

Visualization: A Key to the Inner World
... [When visualizing people] At this point, notice the creative power of the mind. If you have worked through each of the visualization exercises I've given, mastering one before going on to the next, you will find that, as in dreams, the mind creates the face for you without conscious effort on your part.

The world around you might be described as appearing in the same way. Dissolved within you are beliefs, expectations, knowledge, all sorts of accumulated archetypal patterns and so on, which might be said to "filter infinity" into superimposed patterns (facts-of-the-world as 'dissolved into the background'). Your intention is a "selection" from the resulting possible patterns. You do not need to control the details because - like the smell of a flower bringing forth all the related memories and knowledge associated with it - the result is already part of the extended pattern with which the intention is associated.

In other words: Intention is a static selection mechanism; it is an additional 'fact' you add to your world. This is why "allowing" needs to be the basic approach: you are not creating an image, you are 'letting form' or 'letting through'.

The whole point with visualization is to begin bringing subconscious/unconscious capabilities into the conscious domain.

Why would you want to bring things into the conscious (actually: present moment expanded sensory) domain? That's like people who want to be directly aware of all the "steps in between". But there aren't any steps, unless you are experiencing them. If you get whatever you want, that's enough. There is no secret mechanism behind it. There is no "how it works" to anything.

The "point" of visualisation is... to summon desired sensory experiences.

EDIT: The so-called "unconscious" is perfectly present at all times as the background to conscious experience. It just isn't experienced as unfolded image-sound-texture. It's the stars in the sky vs the midday sun.

What if you could not only begin to visualize on the level of sensoria, but also share those visuals and other senses with another being in the so-called waking sensory universe? For me this is where the interest lies, and it would be of great achievement if it were possible in a consistent way. This is real magic we're talking about. I've experienced something along these lines, so I know it to be possible in some capacity. In your scenario you describe you are simply trading one illusion for another, except you would be the God of the illusion. Perhaps that comes with its own perils, and if it is so that we are already in an illusory universe that is "run" so to speak by a God, then I'm not sure that trying to master the illusion is the correct goal - I would assume that mastery over the Truth would equally provide mastery over illusion, with the added benefit of being aware of the true nature of reality - not simply being a master of shadows.

And this is a key issue, right? Say you have the ability to create a fully convincing visualisation of an army of angelic warriors, floating in the sky above you.

- If everyone can see those warriors, you're God.
- If only you can see those warriors, you're mad.

Right, so I'd rather aim to be God than mad.

Good choice! :-)

Thing is, it's how deep you go to make the changes I think. Mild autosuggestion and you are creating hallucinations for a localised self (dreaming you are mad: oops). Deeper, deeper and you are creating hallucinations for consciousness as a whole (dreaming the whole world is mad: fine).

So many dilemmas of free will vs determinism when you get into that though.

Don't worry about it. You always have free will relative to the "dimension" you are standing on, which corresponds to the one you can't perceive at all. For instance, you are having a 4D experience of a 3D world right now, which means that you are "standing" on and intending from 5D. (Although actually you are awareness and beyond dimensions fundamentally, but this is a convenient way to think about it.)

I questioned how this could be. How could some other being be having free will, but also be synchronistically answering my inquiries?

It happens all the time. One may think of it as over-determination. That everything is already taken into account. So, the conversation in the bus is about whatever it is and is about your situation and is about the guy next to you's situation, all happening simultaneously. Since this is a headache, it's easier to just say: look, waking life is just as dream-like and metaphorical as dreaming life. It is filled with personal meaning because it basically is yourself as projected out. Imagine that everything that you are is folded down into a little, tiny speck in your heart area. But what this does is, it projects out in all directions a metaphorical representation of you. You are therefore literally experiencing yourself, exploring yourself as you go about your day. If you want to include other people in this, imagine they too have the same setup, so that everyone's projections overlap "holographically" as it were, and the final result is meaningful for all. (You can skip that part because everyone is all you anyway, in effect.)

How are you picturing this 5D world to be?

So for a 4D space (which you are viewing from a 5D stance) you can see it as the Infinite Grid metaphor I posted previously. If you then visualise each small square as being a tube, then you can go further, etc. But really there's no need, because we've already chosen one organising concept ("moments") and said that the grid is infinite. See yourself as the vast conscious space in which the (determined) grid appears, is dissolved in, and imagine traversing the moments by unfolding them one by one (free will). Remember though, there is no dimensionality "really"; it's just a way of conceptualising things and formatting experience so that you can contemplate it and formulate intentions. There is no time or space aside from your experience of time or space. There is no spatially-extended world beyond theses walls; the world is instead a list of facts dissolved into the background, unfolded into/as the senses as you explore it with your gaze.

How does everyone have free-will if they are me?

Other people: Think of them as "Extended Persons" with many aspects, only one of which is being experienced in-the-senses by you. But really it is easier to think of them as parts of you. Or: That every moment, every perspective, every possibility will have a turn at being experienced. As you see, it depends how you look at it: in-time, or from outside of time, etc. There give been reports by people of everyone suddenly looking round...

It's like a choose your own adventure story book.

Good metaphor! Everyone "on Earth" is reading the same book simultaneously, but they had different starting pages and take varying routes. :-)

...and therein lies the paradox.

Right. Eventually you'd choose limits again. You don't really want all your friends and family to be puppets, do you? Most people just opt for a little bit of influence in times of need. The very occasional "I command that this will happen", and a guaranteed result.

If you do bring about a massive discontinuity, would you want to remember it? For instance, jump back to correct a mistake? I think that once you'd done the deed, you'd opt for ignorance again.

Do you mean looking around or looking rotund?

Ha, rotund, good! I mean, people who have "waking up" moments and it seems like everything goes quiet and the other people notice, it goes all Inception. The puppets pause...

Relevant because it's a flicker of loosening grip and focus, and yet being the whole environment.

No, but I've come to the conclusion that I want my body to be my puppet.

Easy:

Relax. Decide that your body is a "shell". Tell it to do something and let it move by itself - e.g. "body, go to the shops" or "body, resurrect". Simply be the experiencer. Build from there. Read the middle sequence of the Missy Vineyard book for inspiration.

POST: Some reasons I hate this realm.

[POST]

==1) In ideal circumstances, life here is too short.

2. The body is weak and subject to damage if exposed in most environments too long.
 3. Sentient beings reproduce in this realm without the permission of or consideration of the community of sentient beings in the realm
 4. The body depends on material resources simply to prevent decay and death
 5. Most sentient beings here are unwilling to communicate and compromise at all, and those that are willing to communicate and compromise are on the whole extremely ignorant
 6. Beings here are concerned with pleasures, status, and possessions above wisdom, integrity, and virtue.
 7. Magick is almost non-existent.
 8. There are limited resources available, and essentially all of them have been claimed - making it difficult to pursue material games and arts or even survive in this realm without becoming a slave.
- My goal at present is to end up in a realm where these qualities are all 100% the opposite. What are your opinions on this realm?

But, hell, at least I don't regularly have molten metal dropped upon me, get sliced into pieces, suffer from a ground made of hot iron, or get attacked by beings with iron claws and fiery weapons until I'm rendered unconscious from pain at which time I am revived, over and over for 1,620,000,000,000 years.

Edit: oh, I forgot one

9. Sentient beings eat each other in this realm==

[END OF POST]

Nice list. Wondering: If there is only one being, being the world, does most of this go away?

7. Magick is how the world works, right now. Perhaps: What you really mean is that you are displeased with previous results (established habits in experience) and wish they hadn't become so ingrained.

If there is only one being, being the world, does most of this go away? Hmm, I'm not sure what you're asking. Would you clarify?

Well, it seems churlish to complain about the details of one's own creation (following the subjective idealist angle of this subreddit). And your desire to "end up in a realm" seems quite passive?

That depends on how you understand magick. I understand magick to be direct acts of will that break the fundamental rules of convention: the laws of nature.

I'd go with something along the lines of: the process by which desired experiences come into being.

Past intentions create patterns which may place limits on the routes by which future intentions unfold. The results of previous magickal acts may become "ordinary" with time and familiarity, may even become so entrenched as to be called "laws".

I think if we define magick more broadly than this, then the word ceases to correspond to its conventional meaning, and starts to become indistinguishable from 'will/intent' in general.

I see where you're coming from. But I'm thinking that to separate the two in this way is a false dichotomy which might obscure the flexible nature of things - the mechanism and process is identical. The "rules of the realm" aren't rules/laws so much as habits, etc.

Opening your hand and levitating are the same. But... one is less likely, apparently.

We can never know why we created a place as we created it, so that has to wait I suppose. But ...

Why do you think transforming yourself will allow you to leave this place? Or rather, that this is the way to get to another realm?

On the magick thing: You are correct of course on the distinction, but the humdrum and the strange arise by the same process, from and of the same origin. This matters because...

Who cares about "convention" and other people? If this is the realm that you created, then all that matters is what is conventional or frightening to you. The "normal" simply corresponds to habits you have developed, experiences you have fallen into repeating. The "esoteric" are just those that are less commonly experienced. There is no difference other than that.

So... the question to ask is, why have you fallen into treating some things as a big deal and not others? Is that perhaps the reason - the only reason - you find certain things more difficult?

Are you effectively just procrastinating making "the jump" by presenting it to yourself as a challenge?

If I want to create and maintain a new realm, I have to change myself.

Might we rephrase it something like - "change the form that I have taken"?

Another reason they're difficult is because a part of me thinks it's dangerous to tamper with my mind in these ways. I'm not totally comfortable with and confident in my own mental power. I think I might go insane or hurt myself. Physicalism is still a deep habit I'm fighting against, even though I intellectually reject it.

Right, and that is where the stress comes in. I was conversing with someone the other day, about how "anything might be possible" but that we actually would often choose not to be able to just, say, command people or instantly teleport, because it would break our model of the world, our sense of stability and safety. This is why I wondered about the "procrastination explanation". And that you might want it to be a slow, gradual, effortful, challenging process where you fiddle about and transform each subtle pattern and structure.

Habits don't usually just disappear, and I'm not sure I would want them to anyway.

The second clause is key. They can and do disappear instantly. And this realm disappears every time you dream or do an OBE. You could just not come back. You could create a persistent dream world and attach to it, or create a tulpa wonderland and swap places, and you're outta here. Or a 'dimensional jump'. They're all the same thing really. Because by investigating and experimenting you're not really accomplishing anything except making yourself more comfortable with radical change (nothing wrong with this, it's a perfectly acceptable way to progress). What you are doing is "dreaming more experiences" for yourself, only these experiences are "about" uncovering how the world work and changing it. You can't get away from dreaming (because you and the dream are the same thing) but you can dream anything at any time. The only trick is that you have to let go of dreaming that you are adjusting this dream, and you have to stop applying effort because it implies a certain sort of dream itself. Someone asked my a short while ago if there was a 'cheat sheet' for using the 'Infinite Grid' metaphor, and I drew this up. The key is the "allowing". Just as with visualisation or even daily perception, mastery involves coming to the stage where you let go and "let the world come to you". Effort prevents this, because it implies and creates a different experience.

Not that I think instantaneous transformation is impossible, but it's not for me right now.

That's totally fine. And the exploration-investigation aspect is pretty good fun anyway. **You got infinite power. Get used to it.** ;-)

POST: The Block of Family Members

[POST]

I am having a block in my progress that pertains to family members that perhaps someone can point me a way out of.

I am finding myself making tremendous progress when I set my intentions correctly and maintain mindfulness of the situation I am in - more clearly, that I am in fact God observing the situation unfold and creating it at the same time - whilst simultaneously acting as a character in the drama. However, there is the one aspect of my life that seems to draw me back into the belief systems of being a simple human with the same limitations I have always had - and that is my family. My family, whom I see very frequently, seem to be distracting me from this truth at every turn - in part it is my temptation to speak to my father about very esoteric ideas, and our following disagreements. It is a very bizarre relationship, one that is constantly pitting me against myself in ways that I cannot fully describe. I feel forced to act a very stiff role, one where I am very limited in what I can say. It is a role of naivety, perhaps much more than I truly am. I also have some friends whom I play this naive role around. I am very tired of it and wish it to be gone. I know a healthy amount of naivety is good for business, but I do not wish to fake it any longer. Can anyone else relate to this, or have any advice with relationships with family members? Friends I'm not too worried about as I can always cut out friends I am not jiving with, and make new friends along my wavelength - but family seems to be a difficult block for me right now. Maybe I need to manifest myself a life in a place more distant from them.

[END OF POST]

Can anyone else relate to this, or have any advice with relationships with family members?

You could go directly into this. Actually, perhaps it's the perfect opportunity for you to amend some of the 'facts' of your world. Wanna be God for real? Just keep it simple. It doesn't matter how you do it, but I'm going to give you one approach.

First - Decide on a scenario that would imply that you and your father had now found a way to converse about 'the nature of the world' and all that you'd like to share and discuss. Perhaps the two of you sat at the table, talking in an animated and enthusiastic way, drawing diagrams, bantering about possibilities.

Then - Having decided, go and lie down somewhere and let yourself relax. Now, bring to mind that scenario, as it would be from your perspective, looking out from your eyes, and make it super-vivid, until you really feel like you would feel if it were happening now. Persist until it is real to you.

Really bask in the experience, in that sensation, immersed in the feeling of it being true-that-it-is-happening, right now. Then go grab a beer, watch telly.

I appreciate the approach, this could work, but it feels too much like affecting my dad's free will to be the way he is. I'd rather let him continue to be entrenched in his own ideas at this point. I have given him enough clues to the nature of reality, and will continue to. I think wanting him to see things the way I do is unnecessary, and probably limiting my progress as I try to continually skirt around these things with him.

Well, your Dad is free to experience whatever world he wants from his perspective and you can't affect that anyway. All that you can affect is the aspect of your Dad that you experience. This is not a simple shared dream - it is "highly dimensioned" and you'd be better thinking of everyone as an Extended Person. Everyone gets to experience whatever they want; including the sort of experience they have of others. In any case, the suggestion I'm giving doesn't change him, it just means you are going to have an animated, open discussion about something, as father and son. His views can remain the same afterwards. :-)

POST: What are some of your tips for shaking off the physicalness of physicality?

...paying closer attention to the daily bodily motions that we consider automatic.

Right, but you don't need to then fix those automatic motions. That persists them. The answer is to learn to not do anything physically at all. Ask to do something, then let your body do it in its own time, spontaneously. I have to say that lots of Alexander Technique books and lessons have lost the spirit and experience of the core idea. That's why I specifically recommend the Missy Vineyard book because of its middle section; that's where the insight is. It is the realisation that you don't need to do being a body.

When you experience yourself "doing" something, you are in fact experiencing yourself tensing up and opposing spontaneous movement. And once you have the idea of body-doing in this way, it lingers. You are always subtly "holding yourself in position" - and this is what gives you a sense of being a solid body, rather than a transparent space in which sensations occasionally arise. You have basically creating a permanent, oppositional felt-experience in the body area, that you will seem to have to push through to achieve anything. In reality, you can just decide to move and your body will do the necessary things itself. "Stop doing the wrong thing and the right thing will do itself." In fact when we make such "decisions" the whole universe moves a bit in response, in answer to the larger intention.

Over time the accumulated sensations and ill-formed ideas we've become wrapped in will naturally dissipate once you stop re-imagining them all the time, and you will feel more "transparent and open", although you can take more conscious action to help yourself if you like. Here is a different example that uses this approach for using this to rediscover an object you've lost and can't remember where you've put it. The final step is the most important.

TL;DR: We tend to want to experience ourselves doing-the-doing. The secret core idea of the Alexander Technique is that this is impossible - we in fact only experience results - and any attempt to control the "how" of movement actually opposes it, and increases our sense of inertia.

I did this exercise a couple of nights ago, and I had the same feeling of futility... Perhaps the Missy Vineyard book will have some pointers on how to do-not-do when it comes to the body.

It can be frustrating. The book is good because it can spend the time telling the story, give you a feel for the time it takes, not something we can do in these comments. Having twigged 'something was up', she is determined to have the experience and it takes a while, until one day... her leg just "moves by itself". Remember, you've spent years maybe even decades constantly implicitly intending yourself to stay still, to stay fixed and controlled. You've created a hurdle of immobility which opposes your intention to "just allow movement". But it will happen.

Vineyard isn't necessarily correct in her explanations for things; but she describes well the process and experience for spontaneous manifestation of bodily activity.

I know this may be a tough question to answer, but in this lost object example, what does the command or deciding feel like that the body responds to?

It actually has no full sensory component. Sure, we might internally verbalise or something, but that is all just theatre. What it's like though is, the background felt-sense of the world shifts a tiny bit. It's already true, you are just waiting for it to happen now. If there's a feeling, it's of "absolute allowing". It's a state of fact and knowing, rather than an action.

Intending/deciding and free will are before sensory experience. That's why they can't really be talked about or described, even though you "know" you have them.

To Contemplate

What is the difference between your arm moving spontaneously and your heart beating and the sun moving in the sky? It's like the Zen thing about who it is that "makes the grass grow". Perhaps you "do" them all, but you ascribe authorship only to a subset of your experiences, for some reason. How do you distinguish between what you are the author of? Is this an arbitrary distinction?

Could it be that we don't "do" anything at all, we merely decide what we are and the kind of world we live in, and sensory experiences then arise spontaneously in accordance with that? Imagine that! ;-)

EDIT: Made a few tweaks, added some sentences.

POST: Invoking the Witching Hour. New exercise

[POST]

So I came up with a mental exercise today that I think that tackles the issue of both cultivating temporal lucidity and lucidity in general. Legends talk about the so called "witching hour" where witches and sorcerers would cast their spells and call upon spirits. It was traditionally around midnight but most occultists agree due to our new modern lifestyle the witching hour is around 3am. But what is so potent about the witching hour and late night time in general? Is it because it is dark outside and no one else is up. Well that is a big part of it yes, but in an oneirosophic context, it is generally the time of day when we are asleep and dreaming. In other words 3 or 4 am is the time of the day when the physical and spiritual are most closely linked because it is the time of day our selves and our meat suits associate ourselves with being asleep and in a dream.

Instead of thinking about being in a big waking dream, try to go further and assume you are actually in one of your many sleep cycle dreams right now. So the exercise I lay out is very simple, whatever time of the day it is, try to convince yourself it is around 3 or 4 o'clock in the morning. If we think of ourselves at being at 1 o'clock in the afternoon, its a time we associate with being awake and not dreaming, and hence not lucid. If you ever have a lucid dream, even if its the day time in the dream, there is a vague sense that its very late at night or very early in the morning even if in the dream its full blown daylight. In other words when its five o'clock in the afternoon, you want to create the feeling that this is not only a dream but in actuality its very early in the morning and you are about to wake up for work/school.

And if you really want to take this to the next level pretend its not only 3 am, but since its spring right now, pretend its actually 3am and early winter or late fall. When it comes to lucidity, there is that time when a lucid dream collapses and there is nothing, but you still cant feel your body yet, the awareness of that place/state of mind is crucial IMO.

[END OF POST]

I like this. Related-ish article here [dead link]: In olden times (because of the darkness, work hours, and lack of electricity) people would have two sleeps. They would go to bed fairly early after nightfall, then get up in the middle of the night to perhaps talk, have something to eat with the family, or spend time thinking and writing, before returning for a second stretch of sleep until morning. Because of the sleepy-dream-time that this period of waking occurred in, the mind would be more attuned to the symbolic, creative, dream-like realm and people's writings would reflect this. I think it might have been me that posted it before, but since I couldn't find the comment, I figured I'd repost. I just liked the whole 'vibe' of the situation it describes. Except, how would I charge my phone?

POST: How To Grow Faster?

Define "grow"!

You're already complete; it's just a matter of having one experience rather than another. Is there a particular experience you are looking to have?

Q: You're already complete
So says you. And then a thousand people implicitly or explicitly tell him he's a piece of shit. What should he believe if he continues to solicit the opinion of others? People don't all agree with each other. If you really solicit opinions of others as something that can potentially define who you believe you are, then you're cutting yourself off at the feet, and you'll never be confident in any endeavor, including the endeavor of leisure and relaxation.

It seems obvious to me that everyone should agree with me - and indeed, will. ;-)

Good point though: Don't believe thoughts or experiences as your source of what is true - assert.

But to assert effectively one needs some stunningly glorious wisdom and understanding of one's own mind. It's not cheap. I've been at it for some time now and I am pretty serious, and still I can't rate my asserting abilities as anything above pitiful. I know I can do better, and will.

The assertion itself isn't as important as the detachment (withdrawing emotional investment from the present 3d sensory experience) and "absolute allowing" (letting any experience come through, without obstruction). It must also be an open, unbounded, spacious mindset. These are challenging, because it feels quite vulnerable and exposing to do this. Imagine that! :-)

Very good point. Asserting is important, and finding ways to give your assertions gusto and matter of factness is important indeed. I agree with you that detachment is the more critical and perhaps more difficult step for some. I find that I can assert myself to be detached. The trick is being constantly detached without having to constantly remind yourself verbally. Would love some tips on that!

The trick is being constantly detached without having to constantly remind yourself verbally.

Yeah, once you "just decide" to become detached, it happens (because it's a change of state just like any "decision"). The trick is to never directly interfere with yourself ever again. Ever. But... habits.

You have fallen into the trap of thinking there are "levels"... There will always be more and it will never be enough.

This is a great observation, I completely agree with it. We can think we are discovering the secrets of the universe, looking closer and closer and uncovering more detail and relationships within the world. But actually, we are not getting deeper at all. All you are doing when you investigate the world is... creating more world.

There's awareness (the background that you are). And there's experience (game content). And you are signed up for an unlimited, on-demand DLC package.

POST: Why experience exists?

Q1: The question: why does experience exist? is made of experience. So would be the answer. So how could that be satisfyingly answered?

Q2: Good point. So it seems we'll never know...

It's really that there is nothing to know - because it's not that you exist, it's that you are existence. And to exist at all is to be, and to be is to experience being, and to experience being is to have an experience.

This is a problem of language: language is "too late" for examining this sort of stuff, because to speak we have to conceptualise, and conceptualisation is thought, and thought is "shadow-sensory", and that requires division and relation of mental objects... which is unfortunate, because we are trying to talk about the thing that is "before" division and multiplicity (because it is it).

POST: What is Oneirosophy? (By cosmicprankster420)

[POST]

Oneirosophy is an idea i have been playing around with which basically is a combination of dream yoga and gnosticism but without any tradition or dogma. In a way it can be thought of as the chaos magick equivalent of dream yoga or chaos yoga if you will in that it attempts to use lucid dreaming and or lucid waking to gain a deeper level of lucidity in this dream world. What separates Oneirosophy from tibetan dream yoga is that while dream yoga seeks the dissolving of the ego and entering nirvana, Oneirosophy is only about achieving and maintaining lucidity in this ideaverse and it is up to the practitioner to decide what he or she wants to do from there. It is open to practitioners of both left and right hand paths. Oneirosophy also has parallels to the Thelemic concept of true will, Oneirosophy is about being able to be lucid in this world to create a dream more tailored to your own unique will. Ultimately Oneirosophy has a lot of room to be explored, whatever it really means is still somewhat unknown, but through discussion it can be explored much deeper. Many people claim to be subjective idealists and feel that this world is a dream, but there are still many challenges and obstacles that bind us to the material world. Oneirosophy proposes discovering personal techniques to maintain a sense of lucidity as well as recognizing and overcoming obstacles that hinder our progress

[END OF POST]

Perfect timing!

I've finally got around to playing more seriously with a Dream Yoga type approach (having done lucid dreaming for years), one reasonably independent from any particular traditional worldview hopefully - although various sources can act as inspiration. (The questions raised in Robert Waggoner's great book got me interested again, for instance, along with Rupert Spira and Greg Goode's writings on non-duality, Douglas Harding, and others.)

I've been experimenting with trying to be more direct, and 'overwrite' the sense of boundaries with empty space, to create a direct non-dual, open feeling - a sort of unbroken 'ideational space':

==As stated above, an important part of this practice is to experience yourself as a dream. Imagine yourself as an illusion, as a dream figure, with a body that lacks solidity. Imagine your personality and various identities as projections of mind. Maintain presence, the same lucidity you are trying to cultivate in dream, while sensing yourself as insubstantial and transient, made only of light. This creates a very different relationship with yourself that is comfortable, flexible, and expansive. In doing these practices, it is not enough to simply repeat again and again that you are in a dream. The truth of the statement must be felt and experienced beyond the words. Use the imagination, senses, and awareness in fully integrating the practice with felt experience. When you do the practice properly, each time you think that you are in a dream, presence becomes stronger and experience more vivid. If there is not this kind of immediate qualitative change, make certain that the practice has not become only the mechanical

repetition of a phrase, which is of little benefit. There is no magic in just thinking a formula; the words should be used to remind yourself to bring greater awareness and calm to the moment. When practicing the recognition, "wake" yourself – by increasing clarity and presence – again and again. until just remembering the thought, "This is a dream," brings a simultaneous strengthening and brightening of awareness

- The Tibetan Yogas of Dream and Sleep, Tenzin Wangyal Rinpoche==

(Thanks to /u/Nefandi for the heads up on this sub's existence.)

Q: Very nice quote, thanks.

I've been experimenting with trying to be more direct, and 'overwrite' the sense of boundaries with empty space, to create a direct non-dual, open feeling - a sort of unbroken 'ideational space':

I feel like everything is happening in the same mind these days. Which is weird when I say this, because it's like "duh, of course" but somehow I never realized that dreaming and waking happen in the same mind, or I realized it superficially but not what it means.

When practicing the recognition, "wake" yourself – by increasing clarity and presence – again and again. until just remembering the thought, "This is a dream," brings a simultaneous strengthening and brightening of awareness

I don't like this approach at all. I actually think that to achieve what Tenzin's talking about, instead of waking up one has to fall asleep to some extent during waking. In other words, one's mind should be more dreamy, not more waky. So lucidity in waking is awareness of the dreamy aspects. Lucidity in dreaming is awareness of the waking aspects. It's a restoration of wholeness in both cases and not trying to wake up more and harder. And by "restoration of wholeness" I mean that typically we might lose the dreamy aspects in the waking experience and we might lose the waking aspects in the dreaming experience. So in a typical scenario both modes of experiencing lack aspects of the other one, they're partial and not whole.

EDIT: Reply got a bit longer than intended!

I'm with you and I'm not with you.

I think we want to be "awake" as in to have clarity of experience, but recognise we are "dreaming" in the sense of being aware that what we are experiencing has a transparency to it, that there is nothing behind the imagery, no "solid underlying". I think you need clear and expanded attention to do this; I think that's what our friend Tenzin's getting at. See if we are on the same page: For instance, a simple exercise is getting yourself to understand directly that what you are experiencing right now is an 'idea space' in which forms are appearing. Obviously, we normally assume that we are looking out from a body and the world is "out there", and we literally feel this to be true. So that spell needs to be broken. How to do?

A couple of things I've played with:

1. If that model were the case, we wouldn't be able to direct our attention to where we are looking out from (the space in the opposite direction from the 'vision' in front of us), and we wouldn't be able to reach out with our attention and literally feel the space around us. But we can. In fact, you can 'feel' in all directions forever. And when we explore our location, where our body and head is, we find mostly just empty space, with a couple of sensations 'hanging there'. No "me".
2. Do the "where is your hand?" experiment. Put your hand in front of your face, and ask where your real hand is, try to point to it. The hand in front of you isn't your real hand (by standard thinking), it's an image created by your brain 'inspired' by received bodily sensations. But if you find yourself pointing to your head/brain as the location, then ask yourself: ah, but where is my real head? And so on.
3. If I hear a sound, and pay attention to it, I might ask "where am I relative to this sound?". The usual answer is that I am "here" and the sound is "over there". But when I really pay attention, I discover that I am right beside the sound, coincident with it, as well as being over here, where my body sensations are.

Eventually we discover that the "feeling of being over here" is usually just a particular body sensation or mental image we are attached to and that we identify with (often a sensation in the neck or middle body, or an image of a 'dot' somewhere behind the eyes, a mini-homunculus) and perhaps a sphere of extended space around our body sensations that we count as "us". But the more we deliberately summon and create a feeling of "open, empty space forever" in place of this, the more we dissolve those habits, and the more we feel that we are the 'idea space' or 'mind space' (or dream-space) in which experiences arise. Then, when we fall asleep, instead of us disappearing, we have the experience of the world dissolving, sense by sense, and then dreams forming - within us.

That's the idea anyway, I think.

TL;DR: I think we become lucid in daily life by combining an increased clarity of waking with a direct understanding of the dreamlike transparency of objects, so that waking and dreaming life are experienced as arising in the same 'mind space' = us.

You will feel more awake, but the world will feel more dreamlike.

...

I think we're very much in agreement.

But to me "waking up" means returning to the context of convention. It means returning to the body

"Waking up to the dream" is perhaps a better phrase, rather than just "waking up". You're not trying to wake up to somewhere else, you're just coming to an understanding of your actual situation. So maybe it's better to just say "becoming lucid" or some such instead, to avoid confusion.

I don't agree with your "No me" phrase. It's a popular one, and I get really tired arguing with it.

Ah yes, I used the quotes around "me" deliberately...

No "me".

...to indicate there is no "me" as in an object. (I could have been clearer.) What I discover by investigation is that I've been mis-identifying myself and mis-locating myself. I should be identifying myself with the entire space of my experience and all that arises within it.

I am 100% against the complete abandonment of oneself.

Yes, becoming lucid means a recognition of what you were all along; it's just a clarification of the oneself, not an abandonment of it. What you thought you were turns out to be a 'dream character', whereas you are 'the dream(er)'. Loosely speaking.

In this way I vehemently disagree with the Advaitans who keep harping about lack of free will.

I think they do this because of a key difficulty with volition, or intention as I tend to call it. That is, you can never experience intending or doing - you can't experience "first cause" - only the results, so they discount it. Strangely, though, their reasoning should lead them in the opposite direction:

If what I am is that 'space' then every experience and form arising in it is me 'taking the shape of that experience', like um, a blanket folding in upon itself. The blanket moves itself, one bit doesn't move the other bit, it shapes itself. Just as when we say "I moved my arm" really what happens is "our arm moves", so it is with the content of experience.

"To intend is to wish without wishing, to do without doing. There is no technique for intending. One intends through usage." – Carlos Castaneda, The Art of Dreaming

Aside: Throughout this, I've put aside the issue of intersubjectivity - that we all have different perspectives, as if we are different consciousnesses looking through our own 'viewports' - but I think once you get to grips with the personal aspect, this comes out of it.

You always move the known universe at all times no matter how tiny and selective your movement appears to you.

Yes! Because previously you thought of you as thoughts, sensations, body vs the universe, but now you realise that all that is the universe. You intend a change, and then results appear: related thoughts arise, inspired bodily actions appear, the environment around you moves toward your goal. If your present moment universe in its entirety was an image, it's like the old morphing effect that was so popular in movies circa mid-80s, as you transition to the new desired state.

I think this could be a good sub.

Q: Yes, it's because "the arm" makes no sense by itself and it can't be moved by itself. "The arm" only makes sense in the greater context, and you have to change the relations in that context to move even one particle of dust in that context. In other words, in the picture that we see nothing is by itself. Everything contextualizes everything else. All meanings are interdependent. There is no arm without the sky, no sky without water and grain and trees, etc. It's not obvious at first, but if you trace what it means for a sky to be a sky, you'll discover it's connected to every other idea we have about phenomenal conventional reality. So for example, the sky has to be up. Without up it's not the sky we know. The sky has clouds, sun, stars and the moon appear in it. If these didn't appear, it wouldn't be the sky we know. Clouds can produce rain. If clouds couldn't produce rain, they wouldn't be the clouds we know. Rain falls down. If rain didn't fall in the downward direction, it wouldn't be the rain we know. Rain hits the earth. If rain were to fall downward endlessly without ever hitting any earth, that wouldn't be any kind of rain we currently understand. This brings us to earth. And so on. So once you look into the ideas, it seems like they're arranged in a web. Almost like the world wide web on the internet, but 100% inside our own mind(s). This is how we structure our experiences. The spacial and temporal contexts are all fused like this too. Something that's 100 meters/yards away from here is conceptually connected to what's right here in the same way earth is connected to the sky and is inconceivable without it from the POV of convention. Actually "connected" is not a good word. More like "inseparable." This is why if a single thought or a single hair appear to move, what really happens is that the known universe changes its state according to your volition, but then you associate yourself with just a thought or that hair, and disown the rest of the universe as if it were something foreign to your being. The known universe is not complete without every thought and every hair, however they are experienced.

Good points. This is why so much formal instruction is about encouraging the student to perceive the space around and between objects while attending to the objects themselves, to realise that one requires the other, and that they are the same thing. In a sense, it is the surrounding context that can make a change: if you were not the space around your arm, it could never be moved.

...

A1: Dope. I'm glad this sub is taking birth now. A few ideas that may be worth noting to help get us started... I feel that 'enlightenment' is kind of a stupid concept in this day and age. The ideas of lucidity or my personal preference, wakefulness, better capture the process of coming into realization of our own self-envisioned nature. Moreover, the ideas of lucidity or wakefulness better capture that this is a process of gradual unfoldment, not some binary state. With the conventional dream state, it is easy to recognize that our degree of lucidity often varies from night to night, dream to dream. The conventional waking state is like this as well. There are powerful techniques for cultivating this type of wakefulness in conventional waking reality. I have had great success with meditation in this regard. In doing so, I have found the notions of lucidity or wakefulness to be quite literal. I am literally more awake than other beings. I don't even know how to say it, it's so literal... my awareness has ardent, alert, lucidity. I'm not saying this to sound inflated, it just shocks me sometimes. 'I' am literally more engaged with the reality around me and can discern 'my' engagement in it. There is more energy, power, and recognition of subtlety to the awareness 'I' currently experience. The level of power coming into fruition through my awareness sometimes bleeds into the perceptions of others, leading to interesting results. Perhaps this indicates my own subconscious surprise at the radical nature of my being? ;)
I'm obliged to admit that my path is heavily steeped in the Buddhistic tradition. I have studied and practiced the teachings deeply, and have been undergoing an incredible transformation progressing at a sometimes frightening and shocking pace as a result. I'm certainly open to and can work in more dynamic, (post-)post-modern, chaos paradigms. I actually see (Post-)post-modernism as quite analogous to the Vajrayana. The Vajra-yanas are the aspects of Tibetan Buddhism that most explicitly engage with the magickal nature of conceptual adherence. In Buddhism, they call this 'Right View'. You'll also notice that 'Right View' looks really different as one progresses through the 9 yanas or levels of Tibetan Buddhism. In the same way, (post-)post-modernism is working on this conceptual level. In most cases however, this tends to occur as a merely intellectual exercise. Thus, chaos magick has the potential to take things many steps further by providing the potential to actually realize those concepts. ...so yea... what's good fellas?

POST: Trusting intention

[POST]

I had an interesting realization that has been helpful to confirm how you are literally and directly changing your experience based on your will/intention in every moment. I found it helpful for those lingering separation contexts that I find myself operating from. Observe the simplest, most mundane things like intending to go to the store. Your body moves. You collect your things. You go to your preferred mode of transportation. You arrive at the store. You probably create a story with thought about how “individual you” did these things, but your greater self, as the whole dream, did these things. Your body and your environment are not separate. As one, they changed in accordance with the way you expect this apparent world to work to give you the experience of going the store. If you lift your arm right now, all that happens is the will to lift it, and then the dream changes, giving you the experience of lifting the arm. In the exact same way, bigger life things happen from your intention. There is no difference, even though you may not have the quick feedback that comes intending to walk to the other side of the room. The only difference is that based on the rules you are currently operating from, it may take some time for you to see those results. The trick is not to think that what you're currently experiencing has anything to do with what you are intending.

[END OF POST]

Yes, this is exactly right, and nicely put.

intending to go to the store ...to give you the experience of going the store.

Right. All intention is indirect, in that it effectively inserts facts into the world which subsequently arise in the senses. In effect, you are only ever requesting experiences; you are never actually "doing" anything. We should think of time as laid out as an eternal landscape: If we request, or imagine-that, we go to the store, a whole pattern of experience is immediately laid out across time at that moment. It becomes true now that these things will be experienced then. Our attention then traverses the landscape, as it were, and we have the moment by moment sensory experience of "going to the store" appearing in awareness.

The trick is not to think that what you're currently experiencing has anything to do with what you are intending.

So - your current experience is a particular moment unfolded into the senses, in accordance with the current facts - but just being an image, it has no causal power over you. Meanwhile, intention updates facts-of-the-world independently of your current experience. It doesn't matter what the facts used to be, you can simply assert new ones without justification. Only your intention has power, no events can have power over you, although your beliefs might modify the route of manifestation. This includes changing past facts that might contribute to future experiences, remembering that all time is available now.

an analogy i've been thinking of (and which was one source of inaction) is 'booking a flight to nepal, going through the motions of doing it, having done it, remembering it, then do i remember how i did it?' this applies also to past events, all the way back to the first action of the self

Ah. We lose our place because we don't really remember the first action, and confused experiencing with doing. We forget that we caused things. Filling out forms and forgetting what we committed to, that's a nice way to think of it!

Very astute I like this additional perspective of the same coin. I had a brief upset today where I found myself on a path that I had very little control over it seemed, though I did, I had "fallen asleep at the wheel" for a little while and this disappointed me. I had to directly re-assert that what I was experiencing was not what I wanted to be, mentally, and it sadly took some hesitation and psyching up to be able to set myself in motion - this was because I had told myself a set of rules, which in this case were social convention, that I told myself I had to obey, for the sake of not offending anyone (many mistakes here, I know.) I did eventually excuse myself and leave but because it took so long I was disappointed with that. Needed to vent, but yes, I appreciate your comment and OP's, very spot on today. I suppose I am torn by the aspect of loving the characters of life, and not wanting to be governed by them. I think I need to give my character a little more - a lot more - independence. I will.

Sometimes it's only by ending up in certain situations that we realise who we are. If we've gone through a period of not quite trusting ourselves, loosening the grip on the rudder, we can end up bumping the boat (I'm choosing water-based transport metaphors today!) against the banks of the river. This wakes us up. Ah-ha! We reset the course and the wind picks up again.

Q: I'm still moving into greater understanding of this myself, but I'll share what it looks like from my current point-of-view. There is no difference in change between the intention to move your body and the intention to change your experience. Experience instantly begins changing. The difference in manifestation time is determined by your beliefs. Your body feels like you—it's the vehicle for your will/mind in this dream. So, its movement is fast. For larger changes, there are a number of beliefs about how this world works layered on each other that were learned as the body-mind that you're identified with developed. Each belief creates a sub-intention, or context within which your intention is capable of being manifest. Simply practicing more intending is a great way to peel away these beliefs. Every time you intend, notice where your resistance comes from. That's a belief that is coloring what you think you can do. Examine it by quieting the mind and questioning its validity. To address the speed question more directly, start noticing your beliefs about how fast you think manifestation can occur. One thing I used to do was intend things to happen and then wait for it. All that does is change your intention to I'm waiting. Feel your intention as already being here.
edit: Also, what I'm doing right now to erase doubt is based on what I mentioned in the original post: I'm making it a point to notice how my intention is the true leader of my experience whenever I do more immediate and mundane things, like walking to the refrigerator. What I would normally interpret as me getting up and walking past things to the refrigerator, I am instead seeing it as me holding an intention to go to the refrigerator while my circumstances—body + perceived environment—change to give me that experience.

We could think of it as layers of patterns over a static universe. Beliefs, expectations, knowledge, habits - they all superimpose over each other to form "more-likely" routes for experience to take over the landscape of possible moments. Then, when the pattern of intention is superimposed in addition, one route is in effect selected by becoming the more likely one. If it weren't for those beliefs and expectations, the pattern resulting from our intention to "have a beer" wouldn't be so extended over time, perhaps. Also, I suppose we do tend to intend in terms of the limitations we perceive, or at least not deliberately counter them: we don't intend for "a beer to appear in my hand", we do intend to "grab a beer" and the "go to the fridge" part comes with that. We unthinkingly go for the familiar route that appears in your minds when we think of what we want. So unexamined beliefs-expectations-knowledge both shape the original intention, and limit the subsequent path of an intention.

I also don't think it's necessarily relevant to jump to beers appearing in the hand.

No indeed, it's just an illustration of how the time-delay and 'world formatting' aspect comes into effect. Most people don't want to completely dissolve solidity - and rightly not. The intermediate experiences are where the "living" is, after all!

I also get the sense that a greater portion of ourselves is facilitating and guiding from a broader perspective.

I think this can be folded into the more general picture? I'm not sure "guided" is right word - it's just an example of your intention trying to push its way into manifestation. It's inside experience rather than outside trying to push in.

For instance, we might get too narrow focused on something, perhaps on a job we don't care for anymore. We are forcing in that direction even though we don't really want be having that experience anymore, and have explicitly or implicitly intended for something else. (In a sense we've forgotten our freedom.)

Our broader intention will put things into our experience to dislodge that narrow focus, even though we have also intended for "focusing on getting this job done". It will get more forceful the more we resist. Offers for alternative jobs might come up. If you ignore that, you might suffer an inexplicable back pain which means you take time off work (work that you don't really want to do). If you keep focusing on the job, you might start finding you overhear conversations about people in the same situation as you, who decided to quit. Then you will get made redundant. If you then get a similarly bad job, you might get framed for murder. If when you get out of jail you still go for that same career, you have a stroke which inhibits that part of your brain... And so on. Basically, your experience will be attempting to dislodge you from that narrow focus and drag you to your true intention, kicking and screaming if need be. Of course, if you remained in 'open focus' ("absolute allowing") none of this would happen, because your body and thought would naturally flow with the rest of the environment towards your desired situation.

...Hmm. I guess it can be viewed equally from either perspective. I'm just wary of the whole "larger self" guiding as if it were a being with a personality and a will independent from our own. Although if we imagine that this is the case, I suppose we end up with that experience.

So, this process could also be seen as slowly reintegrating and rediscovering that greater part, which is never really separate and is supporting us all the time.

I think that personifies it too much?

But, I guess "reintegrating and rediscovering" is just another way of saying that we should release 'hard control' of attentional focus, admitting the whole of experience, in the spirit of "absolute allowing". Intention is what directs experience, and any second-cause tool, no matter how subtle - be it praying or visualising or 'focusing our attention' - is just a way of giving ourselves an excuse to let it come into our lives. (We really do like to feel ourselves doing something to 'cause' results.)

There is only First Cause and that applies even to an apparent story of self-discovery.

I completely see what you're saying here. I certainly am not trying to have people create a new God for themselves. When I say that it "guides", it's more of a description of how it can feel from this perspective inside the dream. I also agree with your idea of intention pushing in with the added possibility that part of that intention that is pushing in is a greater intention that our limited perspective may be fully aware of yet. A more general 'plot theme' for life, if you will, that we offloaded to the part of our own intelligence that remains undeluded from the dream. It's never forced upon us, but we are intuitively guided to see it over and over.

Plot theme, yes! Which really just corresponds with what we truly desire.

More concretely: if we always secretly wanted to become a lawyer, but went to art school instead because our parents wanted us to, we would likely continually encounter law-based opportunities. If we remain open focused, we would feel the "rightness" feeling when those came up. It might seem that God is looking out for us in such circumstances, but really it is a pretty mechanistic, pattern-based phenomenon - a deeper intention pattern overlaid on everything else.

Which leads to something else: if there's work to be done, it's about reducing the barriers to manifestation, to reduce the time delay, rather than improving intention. Which is where the "Just Decide" stuff came from, and "Overwriting Yourself". You can't really intend any better, as a skill. You can just do less obstructing.

Living life is fun and shortcutting all the time would reduce that. However, it is occasionally beneficial to be able to go to sleep in one situation, and wake up the next day in a different one.

TriumphantGeorge Compendium - Part 18

POST: Some insights from lucid dreams

[POST]

I've been trying to experiment more in my lucid dreams to get a better understanding of how they work, and hopefully glean some information about how to better operate the daily dream here. Firstly, dream characters are real as fuck. You'd think after you became lucid dream characters would become very one dimensional, flat, or puppet-y, but either because I don't want that or they have a life of their own, or both, they are very lifelike even when lucid - which leads me to believe that people in the daily dream are the same. They have their own life, desires, and those are all real - but also real is the fact that they are me and I am creating them. Secondly, if you can accept this, so can other people. This one I am a little skeptical to test out. So far, one girl in my life has admitted to me that she is me, even going so far as to admit everything is me. It's very funny though, as you can easily fall back into the trap of seeing the dream as having weight again - as I do countless times. I just did right now. Anyhow, knowing everything to be yourself can be a solipsistic nightmare - but you have to remember - these people all have their own desires, lives, will - you gave them that. You could take it away but for God's sake don't. That's solipsism and it sucks. Everything is you, but you want you to be free. It's an interesting two-way street. Thirdly, manifesting things outside the realm of possibility. You can't do it! So, I suggest expanding your realm of possibility. I was in a lucid dream last night. I really wanted to fly. I asked a group of my lucid dream friends what they wanted me to do. Naturally, they said "fly!" I tried, but I couldn't do it! How strange, I can always fly in my lucid dreams. Do you know when I can't fly? When I'm around people I perceive to be real. I knew these people as real, which gave my dream a weighty-ness it normally did not have. I decided I wanted to try something a little different and become an "air bender," and control the natural elemental force of air. I succeeded at first, causing a great big gust of wind, as I knew I'd be able to - but then, alas I could do it no more as I questioned how I was able to do it the first time. I created a block for myself by necessitating a reason or technique to me manifesting gusts of wind. Cleverly, one of my dream characters suggested that if I couldn't do it naturally I could find an object that I knew would enable me to. This to me was a very interesting piece of advice. Any thoughts on the ideas I've presented?

[END OF POST]

Great observations! By the way, if you haven't already, check out the persistent realms post over at DreamViews. From that...

Firstly, dream characters are real as fuck.

You can dream anything. Dream that anything is true, and then experience will line up with that. This works mostly by implication: behave as if something is true and the dream will behave accordingly. Look around as if something is going to be there, and it will be. Which then reinforces the sense that it is true, and so on. Dream characters are as real as... they "are".

Secondly, if you can accept this, so can other people.

Which could get a bit claustrophobic - like when synchronicity gets out of hand, and you get synchronicity about your interest in synchronicity, and it's like suffocating on your own dream-stuff!

Cleverly, one of my dream characters suggested that if I couldn't do it naturally I could find an object that I knew would enable me to. This to me was a very interesting piece of advice.

When you can't believe in 'First Cause' - the fact that you are "doing" everything directly - your fallback is 'Second Cause' - to delegate the power and allow you to believe something else is doing it. This can be technology, or a technique, or a spell, or a prayer, or any gesture. It also deflects you from the fact that you cannot experience the act of creation, only its results. Treating one result as the "doing" (for instance, the flipping of switch, the shouting of a command) of another result stops this being debilitating.

"Intent or intending is something very difficult to talk about. I or anyone else would sound idiotic trying to explain it. Bear that in mind when you hear what I have to say next: sorcerers intend anything they set themselves to intend, simply by intending it."

""Intending is the secret, but you already know that. And there is no technique for intending. One intends through Usage."

-- The Art of Dreaming, Carlos Castenada

Another good excerpt from CC:

[QUOTE]

"You must act like a warrior. One learns to act like a warrior by acting, not by talking. A warrior has only his will and his patience and with them he builds anything he wants. You have no more time for retreats or for regrets. You only have time to live like a warrior and work for patience and will.

Will is something very special. It happens mysteriously. There is no real way of telling how one uses it, except that the results of using the will are astounding. Perhaps the first thing that one should do is to know that one can develop the will. A warrior knows that and proceeds to wait for it.

A warrior knows that he is waiting and knows what he is waiting for. It is very difficult, if not impossible, for the average man to know what he is waiting for. A warrior, however, has no problems; he knows that he is waiting for his will.

Will is something very clear and powerful which can direct our acts. Will is something a man uses, for instance, to win a battle which he, by all calculations, should lose. It is not what we call courage. Courage is something else. Men of courage are dependable men, noble men perennially surrounded by people who flock around them and admire them; yet very few men of courage have will. Usually they are fearless men who are given to performing daring common-sense acts; most of the time a courageous man is also fearsome and feared. Will, on the other hand, has to do with astonishing feats that defy our common sense. You may say that it is a kind of control.

Will is not what one calls "will power." Denying oneself certain things with "will power," is an indulgence and I don't recommend anything of the kind. The indulgence of denying is by far the worst; it forces us to believe we are doing great things, when in effect we are only fixed within ourselves.

Will is a power. And since it is a power it has to be controlled and tuned and that takes time. When I was your age I was as impulsive as you. Yet I have changed. Our will operates in spite of our indulgence. For example your will is already opening your gap, little by little.

There is a gap in us; like the soft spot on the head of a child which closes with age, this gap opens as one develops one's will. It's an opening. It allows a space for the will to shoot out, like an arrow. What a sorcerer calls will is a power within ourselves. It is not a thought, or an object, or a wish. An act of "will power" is not will because such an act needs thinking and wishing. Will is what can make you succeed when your thoughts tell you that you're defeated. Will is a force which is the true link between men and the world.

The world is whatever we perceive, in any manner we may choose to perceive. Perceiving the world entails a process of apprehending whatever presents itself to us. This particular perceiving is done with our senses and with our will. Will is a relation between ourselves and the perceived world.

What the average man calls will is character and strong disposition. What a sorcerer calls will is a force that comes from within and attaches itself to the world out there. One can perceive the world with the senses as well as with the will.

An average man can "grab" the things of the world only with his hands, or his senses, but a sorcerer can grab them also with his will. I cannot really describe how it is done, but you yourself, for instance, cannot describe to me how you hear. It happens that I am also capable of hearing, so we can talk about what we hear, but not about how we hear. A sorcerer uses his will to perceive the world. That perceiving, however, is not like hearing. When we look at the world or when we hear it, we have the impression that it is out there and that it is real. When we perceive the world with our will we know that the world is not as "out there" or as "real" as we think.

Will is a force, a power. Seeing is not a force, but rather a way of getting through things. A sorcerer may have a very strong will and yet he may not see; which means that only a man of knowledge perceives the world with his senses and with his will and also with his seeing.

Now you know you are waiting for your will. You still don't know what it is, or how it could happen to you. So watch carefully everything you do. The very thing that could help you develop your will is amidst all the little things you do."
-- A Separate Reality, Carlos Castaneda

[END OF QUOTE]

That's a brilliant quote. Just amazing. Thanks for typing all that, that must have been quite a bit of work. This might be worth linking in the wiki or something so it doesn't get lost.

Luckily I was able to cut/paste then format a bit. Totally nails it though, eh? I don't think I understood it when I first read the book years ago, but with hindsight it looks so obvious! Particularly the part (emphasised elsewhere in the book also) that your acts just don't matter. They are just things you experience. It is your will that accomplishes desired change. It makes it so much clearer the distinction between will and "will-power". It reminds us nicely to be wary: Are you directing the will to bring about bodily motions that you think will accomplish your goal? Or are you directing the will to bring about the accomplishment? The former will create experiences of "doing stuff"; the latter will create the experience of accomplishment.

EDIT: Just added a new section to the recommended material wiki page, for noteworthy comments and quotes, so we can add links to things we think should be saved.

or it is to say that your will needs some external kick in the arse to get going, making will passive.

Right, it's easy to imagine there is something you do that gets your will to accomplish things. But there is no such layer. I suppose that without the understanding that your sensory experience is "empty" - like a mirage and has no solid backing - it is tempting to think that what you are experiencing now is "causing" something you experience later. One thought leads to another; pushing here results in a movement there; my plan is what leads to my goal. But... 'tis all "deluded doing" as you say. I like that phrase :-)

This is how people come up with the idea of a mechanistic universe, materialism, physicalism, science, etc.

All of which are based on confusing metaphor with reality, and seeing Second Cause where there is only ever First Cause.

People think reality is what appears outside, and metaphor is what is sensed internally, but the reverse is true. What appears outside is only a metaphor for internal reality.

In fact, to say something is a metaphor (for something) at all is incorrect. If you fully adopt a metaphor then that is how it (apparently) works.

Or as master Yoda said, "Do, or do not, there is no try."

Yeah, that little puppet knew a thing or two. He never tried to do anything by moving himself. He always used his inner will (Frank Oz) to accomplish whatever he wanted - effortlessly!

I mean, the guy doesn't even blink, that's how laid back he is! :-)

POST: What's the biggest leap of faith into your own intentional creation of your reality that you've made?

I think I really understand something to later find out, yes I was right, but I had no clue just how and in what exact ways I was right.

Yeah, this is so true.

...

Can I ask, how are you going about setting an intention? As best you can describe it.

...Great description!

Pretty much what I had in mind when I wrote the Just Decide post ages ago and the Imagining That one more recently, but I've always been wary of pushing a particular interpretation because (as you note) that can get in the way. It's hard to put into words without biasing it.

Our Lives... As If

If our experience is basically our imagination space then our lives work on a completely "as if" basis. Whatever you think appears immediately as a thought, and will trigger a sensory experience by association, just like triggering a memory - but filtered through the "facts" you have accepted. Any belief you have presents a hurdle or time-delay between the initial thought and the "auto-complete" of the rest of the memory.

However you imagine that it works, That's how it works. - TG

Think that you need to concentrate in order to get something? Then the world will act as if that were true. Think time is a real thing and that you have to wait a "reasonable period" for things? There you go. Even worse, this happens by association and implication. Like you point out, doing stuff to make your wish happen implies that it's difficult and takes effort to achieve and so it will. If the world works on an "as if" basis, then "acting as if" creates restrictions by implication. Just the facts, Ma'am

If you would truly perceive that this is just an imagination space with a mirage-like sensory image floating in it, then all "as if" restrictions would fall away. That's pretty difficult at this stage though, as you've accumulated many patterns, so the next best thing is to just not think about how things work at all. (In the background we might attend to seeing things as imagination, though, and perhaps clear ourselves out using a technique if we feel less confident.)

Your only task is then to decide what experiences you want to have. Either by selecting an exact moment you want to experience ("it is true now that this will happen then"), or by asserting more general facts-of-the-world that will inform subsequent moments ("it is true now that things always happen like this). More generally: "I will experience the world as if this were true."

Experience arises spontaneously and effortlessly. It does so in accordance with the facts-of-the-world you have accepted. Change the facts, change the experience. - TG

Using visualisation and so on is perfectly fine, so long as it's used simply to clarify or formulate the "decision". For instance, you might "decide" to have a new car. If we want a particular one, though, then specifying it via an image is not a bad idea.

Decisions, Decisions...

If all this is just us, there's nothing we can "do" anyway. Our experience consists entirely of "results". So effortless deciding is something we never actually experience ourselves doing, we only experience the shift in the facts of the world that we make. This takes no power whatsoever. We are basically just reshaping ourselves, as ourselves. **It's mechanical, this whole process.** We never directly change anything in the senses. We simply make decision and sensory experience subsequently falls into alignment with it, through the simply unfolding of patterns.

But what is a "decision" in this context?

Creation by Implication

A decision is just a particular imagining which mechanically activates the extended pattern it is a part of, which then comes into sensory awareness. An example:

- I imagine an owl as vividly as I can. Subsequently, lots of random owl-based experiences arise.
- I "decide" that I'm going to see an owl at the zoo next Tuesday. Subsequently, I see an owl at the zoo that day.

Both operate in exactly the same way: an imagining is summoned which activates a pattern plus all its associated patterns (i.e. an extended pattern, like an auto-completed memory). The field of all possibilities is then filtered through this. In the first case, I've summoned the picture of an owl (basically saying: "owl!"), which is associated with the animal owl plus all imagery associated with that, plus notions of flight, feather, big eyes, and all sorts of more subtle linked ideas. Although I may only notice the main owl imagery, actually all of this will show up in my experience, because I haven't narrowed the specification. In the second case I have narrowed down my imagining to a more specific situation: a specific animal owl, in a specific place, at a specific time. Effectively I'm saying: "Seeing an owl in the zoo on Tuesday" and from that the larger pattern is activated. Because it is a pattern extended over time, I seem to experience it as "happening" but in fact I am simply having my attention pass across a pattern of moments.

We are using partial imagining to activate extended memories in awareness; The extended patterns then appear spontaneously as sensory experience. These patterns may be spread across time. - TG

EDIT: It's worth noting that even summoning just the "overall feel" of a situation is enough to trigger the pattern. Global Feel is a sensory experience and therefore imaginable also. More broadly still, summoning emotions will trigger experiences associated with that emotion; this is why "feeling gratitude" and "feeling energised" works for things like the so-called law of attraction. Having a general sense of happiness and wellbeing filters down the possible experiences to the ones associated with that. Another takeaway from this is that all manifestation is instant. If things aren't happening for you, it's because you are subsequently undoing them before your attention reaches that moment (something you touched on).

Effort != Action. Some things definitely do need some form of action.

Oh agreed. I probably need to emphasise a bit, "doing stuff to make your wish happen". Which is different to allowing actions to arise as part of your wish happening. The "letting go" aspect involves letting your mind and body be moved also, as part of the overall flow of the apparent world towards your goal.

From my personal experience, there is some form of action involved in almost every manifestation.

Maybe it would be better to say, "some experience of body movement is involved in almost every manifestation". From the Just Decide post: If you do some practice you can easily discover that you are not meant to push your body around by effort, by tensing up and forcing. It actually blocks progress. If you completely get out of the way, your body moves "by itself" along the lines of your intention. You don't have to do body movement; you get out of the way and allow an experience of movement to unfold. But if you are actively asserting the contrary experience of staying still and doing nothing, suppressing movement, then obviously this won't happen. The more towards "absolute allowing" you go, the more miraculously the world will fall in line, as you relinquish the limitations you have on what you are willing to let yourself experience. The potential "available routes" then increases.

Because all of those things that the "conscious mind is aware of", are 100% based on the "sub-conscious beliefs & desires"

Right, it's all patterning and filtering. What gives you a result isn't what you do exactly; it's a process by which you have the desired experience come into awareness. Like the post suggests, what you actually want is super-vivid, immersive remembering - because that's what daily life really is. Which is quite an empowering idea, because you don't have to worry about some heavy, solid, material world "out there" that needs to shift and change via the laws of physics. You are just changing viewport, switching perspective, remembering something different...

what you actually want is super-vivid remembering We already have it. But the issue is that its all filled with beliefs that are not helping us in any form.

For sure, our desire is already available to us as a situation that can be accessed, but we are only having a super-vivid experience if we are having it. We can get too nested here!

The concept behind the "remembering" metaphor is that the experience is already available, the corresponding event has in effect already happened, you just need to recall the memory. You are selecting experiences, you are not making events occur.

But too much meditation may lead into a spiritual journey...

Which is a thing in itself. People who identify as spiritual seekers often have... a lifetime of experiencing seeking. Basically, by having that intention they are accidentally generating content and being distracted by it from what the content arises within. Lots of cool experiences, discoveries, insights and so on... most of which is just more world. Stopping seeking is the first step to discovery.

Here's a good question for you: what do you think about "other people"?

...

Thanks for that. I have view on it but it's a bit fiddly to explain. In any case, I think you can't go wrong with: "unconditional loving-kindness, empathy and compassion".

One thing that I know for sure is that we are connected with each other in some form of energy.

If you mess a little with asserting different facts into the world, you'll notice that people's behaviour lines up with your model of them. Just as your own behaviour lines up with your model of you. In reality, there are no people. There's consciousness, and there are images, thoughts, feelings appearing in it. Experience arises "as if" there are people. At the moment consciousness is taking on the experience of "being TheQuantumZero looking at a computer". That means it's effectively an empty world, but also filled with apparent people that are all aspects of your consciousness. We are therefore all very connected because we are all just the one thing. It doesn't get any closer than that!

"causality" or "you reap what you sow"

Following from the above, "nastiness" you launch at a person doesn't hit the person at all, it's launched straight into the whole dream, which then becomes nastier. Similarly, "loving kindness" directed anywhere is directed everywhere. Which obviously better all round! :-)

The extra quirk though gives the answer to the "Why Hitler?" question: You can do bad things without having bad things happen to you, if you think you are doing good or you "know" you are in the right. If you genuinely believe that mass killing is for a great purpose, you'll do just fine. Probably get to retire to Saudi Arabia and live out your days relaxing at "sports events, gym sessions and massage parlours". Normal people have a struggle believing that the bad things they do are good, though, so the "loving kindness" approach is probably safest. :-)

Name does not mean anything, what matters is "its working".

Bang on.

I could see that the each & every person is unique in some form and they are more than I could understand from just my perception (or my model of them).

That's true. Maybe "model" was a poorly chosen word. They do reflect your outlook though; they do behave as aspects of you even when you just sit back and observe - "the way they are" seems to change in line with the "way you are"!

Karma will eventually catch them in the next life. :P

Heh. Well, I believe that what you might call "momentum of intention" has an effect - I don't see it in the most traditional notion of karma though. Guess we'll find out later. Hopefully much later! :-)

So nowadays I stopped interfering in the choice of others (because I'm interfering with their freewill)...

It's a good attitude to take. I don't think you can interfere with others' free will because the world isn't "simply shared" like that (I'll save you that explanation) - but just in terms of what kind of world you'd like to live in, direct manipulation doesn't seem like a good choice. For sure, definitely help people if you can. Telling them won't do anything, by the way. However, you can "imagine them" into improved situations - provided you don't think that's interfering with their free will or karma, that is. ;-)

It has to be unconditional loving-kindless and its easier said than to apply in life.

Right, because even if it seems to be directed at a person, it is actually going to the overall world you are experiencing - which is the same as directing it at yourself and all that you care for. I try and take a general view: What kind of world do I want to live in?

Well, don't want to live in a world of people deserving things and receiving punishments in a cycle of retribution. I want to live in a world where everyone gets their chance and life is good. Thanks for sharing your personal story, by the way, I think you have a great outlook. :-) What you are calling "karma" there, I would say is the truth of what Neville Goddard used to say: "The world is yourself pushed out."

If you are depressed the whole world becomes depressing. If you are sneaky then the whole world takes on the personality of sneakiness. It's not just beliefs and intentions that shape the world. In fact, the more general truth is that it's your entire character that shapes the world - because there is no division. Internal and external both arise from you and are not separate, although in a way that is hard to describe!

Which is exactly what you get to the heart of in your last quote!

As Wayne Dyer says, you attract what you are (and not what you want). Good Luck. :)

Nice! :-)

POST: Let's all stop pretending we don't want infinite power.

Hmm. If you're referring to the last post, I interpreted it as saying one should be careful of thinking you have real power when in fact you are just exploring-experiencing your thoughts about power. Fake power is when your idea of how the creative process works is incorrect. (Particularly if it depends on the belief of some unobserved entity-based.)

If you believe in the incorrect idea, then its a reduction of your power. You get the results, but from ignorance. If someone is getting results from belief-based approaches then they're no better than the chaos magicians who thought they were being belief-independent.

What I am asking is this. When you get results, how do you know whether the results are from ignorance or correct knowledge?

It becomes clear shortly after I've told you, and you've taken on the wider perspective. ;-)

What if you don't care about being better or worse than someone else? If I am the worst of the worst, but I get consistent and reliable results, what have you to say about that?

It's not about being "better or worse". It's about have a greater understanding of your process by not taking on the misunderstandings of others. You don't judge the experience. It is an empty experience. Recognising that, is sufficient. Let's not do the "others" thing. It's the example of a process that's important. The apparent "who" is irrelevant.

...No. There is no tell. It's just... imagery. There's nothing behind it. No inherent meaning at all. Pure subjective idealism, just as you (should) like it! ;-)

I don't think it was your point, though, right? I'm saying there is nothing to tell, nothing behind the experience. So even to talk of a result as arising from knowledge (correct or otherwise) is incorrect.

The short version: There's is nothing to believe about how things come to be. It's mechanical; it's residual patterning; it's free of meaning inherently except in its relation to other arising patterns. "Mechanical" as in a process that does not to be guided. A "law" of subjective reality, as it were. I understand what you mean when you refer to "belief". Although I've come around to thinking it's not a great word. Something along the lines of "background formatting" or "activated patterns" seems to capture it a little better. But - y'know - just language eh. You get what I mean by "mechanical". That's why I put it in quotes. If you imagine owls, you later get owls. Not sure of a good term for that which doesn't have baggage (and after all, the way this happens isn't a mechanism other than it funnels through current accepted patterns). I think that the idea of "belief" is quite restrictive in and of itself. What exactly is a belief? When you go looking for one, it's a vague image which contains a feeling. The "feeling of what is true"? The feeling that you hold onto which brings into presence all the patterns which have that feeling as part of their structure. What I'm interested in here: What is it that's filtering "this stuff" not "that stuff". The idea of beliefs doesn't help describe that in itself.

Mechanical

Uh-huh. Again, I defined the usage: a process that doesn't need guided. Other words are "spontaneous" or whatever. Really, it's best to avoid calling it anything.

It's that which you can't ignore even if you would like to.

Better to switch that around and say that it's the patterns which shape your experience. You don't so much "believe" things as have beliefs. Which sounds like wordplay, but it gets us away from the idea that beliefs are something you do.

but intent uses concepts to structure itself.

Just for language, "intent" doesn't use anything - intention is the pattern. Intending would be triggering such a pattern into an active state.

(Just translating for my own understanding.)

Let's talk about volition. You, I think, seem to have the idea that you are continually "doing" intent. Is that right? Whereas I see intending as something you do to change the pattern, as it were. Experience itself unfolds spontaneously....Okay, I'd say "experience is an ongoing process" and that intending is the way we "set a new course" (by changing our "shape"). But that's just conceptual splitting....What I dislike about that is it implies I am "maintaining" something, while I know in experience I am not. There is no ongoing doing. I've checked. There can be ongoing interfering if you do that, but you don't need to....No, the difference is that I see intention as a filtering pattern which "lets through" corresponding experiences. While in this sense it never "stops" - never stops having an effect - it doesn't need to be "maintained" while you are content with your direction.

Extra: I am viewing this from an "eternal" perspective, in that the intentional filter applies over all-time. It therefore also incorporates the apparent passage of time.

...It depends on which level you slice it. But, in this view, your intentional pattern has "deterministically" defined the trajectory across the possible moments of experience, by filtering it. You will then experience the experiential patterns of that path. I say "deterministically" but of course if you change the intentional pattern, a new deterministic path emerges. This is why you can have precognitive dreams and insights. With the current intentional pattern, the future is defined. However this does not interfere with your freedom because, so knowing, you can alter your pattern, to give you a new future. It all exists (implicitly, if not actually extended) and so all information is available - although our per-moment 3D sensory formatting can fool us into thinking that's all there is. Of course, there are other ways to slice this - take your stand as "this bit" which navigates and alters the "rest of it". And that slicing is itself a free choice. The trick is to go with the most flexible version, which I think is to adopt "the background" as your viewing position, have a static filter dictate what you're going to let through, on top of a time framework.

Is there a limit to how many times you can do this or when?

No. (Although there are more efficient ways.) It's like a 4D pattern that updates every time. Which is why adopting the approach to let things be except when you deliberately want a change is best. Those who don't know, constantly accidentally re-pattern themselves, and therefore dilute their "power" to fragmentation. You can keep changing your intentional pattern all the time, just as you can keep editing a document forever. But if you want to actually "read" what you've "written", this is a bad idea. You never get a coherent narrative going, and you never sit back to actually enjoy the experiences you've cued up.

AI: I think what TriumphantGeorge is saying is that the state of not-intending is a state in which intention is dormant. I agree with you more, as I see the truth in the fact that even intending to let things play out is a... well, hang on. It's very tricky. To let things play out is a much smoother way of viewing it than claiming you are intending to not-intend. This creates an unnecessary recursive process that is useless to enter into. It works better to just frame it mentally the way TriumphantGeorge is, it allows you, rather, it allows me, to feel more at peace. Knowing intention as something that can be activated but then when not in use is dormant, to me is a better view than it being constantly in use.

So when you don't, you're continually signing off on your previous intent. Continually.

I know what you mean, but that doesn't involve intervention or activity. Here I'm talking about whether you actually have to maintain intention. The answer is no. How would you like things to be?

Do you envisage "control" as being something you are constantly doing, grasping the world and all its facts, holding them in place? Not very God-like, I'd say. Or would you rather be the calm background that effortlessly experiences all things arising in alignment with your last "command" - until you decide to issue a new "command", at which point the patterns realign accordingly, and subsequent experiences fall in line?

I like the second one. At the very least, the second one provides the first one as an option. The other way around, not.

Are you involved in some situation? Yes, you are, at all times.

No, I'd say. Or more specifically: it's optional. If you are not holding onto your emotional state (which is just another sense, part of the experience) then you aren't 'involved'. And without that involvement, that emotional re-triggering of patterns, then there is no effort, because each moment disappears immediately, as it should.

What you ordinarily consider as some clumsy and un-godlike strain is itself utmost purity upon final analysis.

A pointless analysis. Just as you can say "everything is consciousness, there are no obstacles really".

I think I've said that ultimately intent is effortless only about a dozen or more times. If you failed to notice that, then me saying it one more time will not help.

Everything is ultimately not even nothing, for sure. But that's not the experience you are having now, is it? "But a significant effort may sometimes be required to turn around certain tendencies", you said. Really? Why?

Or by "intent" do you mean "wishing that"? Ineffectual wishing is effortless, is that what you're saying?

It's all every well to talk about the ultimate state, and how everything should be or "really is" optional because we're all Godlike. But if you look around your life and you aren't living that way, then it's just an idea. An idea you are hopeful might be true. Or just an idea you use for comfort, if you're too afraid to take the steps - delete the boundaries - and let everything flow in. I mean, it's lovely to talk theory and fantasy, but Oneirosophy is about lucidity.

You always undergo some experience. That experience is precisely your situation. Can you talk about a time when you don't undergo an experience? Not from experience!

Surely not, not, not? You don't "undergo" experiences and an experience is precisely not your true situation, right?

Your experience is not the entirety of the true situation because there is also infinite potential which isn't directly experienced, but which is necessary for experience to make sense.

I'd say what we call "experience" we mean "current sensory experience" or pattern?

Infinite potential is always here now, it's just been patterned into the current sensory experience (by which I don't mean just images, sounds, and so on, but the object-sense and also the global "feeling-sense" of it and "a world"). If you relax your hold on those, avoiding "re-imagining" them, we might say that infinite potential gets to "shine thought" - but really we mean that we haven't obscured the sense/actuality of open possibility by crumpling it up. So the more we become non-attached (basically, stop holding onto the feeling-aspect of the current experience, via narrow attention perhaps) the more flexible the world becomes, the more next-moments are available.

On the other hand, you could say that all experiences are sensed.

That is the approach I am using. If it is being "felt" in the aware space, it is part of my present moment experience. The separation into "senses" is another pattern, so that itself isn't a good definition.

Sure, I agree. That's the basic premise behind all renunciation.

What good about this view overall is that instead of people trying to renounce by taking action or saying stuff - all of which presupposes a person who can do something about their experience - it's much clearer what is actually involved: not-triggering, not-activating.

I'm sure it's clear in your own mind, but it's clear as mud over on this end.

Okay. It's time to renounce the world. How do you go about it?

I just do what I like and accept all consequences. Or as one of my idiot friends who knew one or two good sayings said, "Pay attention. Take responsibility." Same thing.

See, that's not how I think of it. I mean, how - right now - do you (I mean "does one") become independent of the world's momentary whims? Do apparent events move you emotionally, affect your mood? Then the world is happening to you and shifting you. That-not-being-the-case is what I'm talking of.

Yeah, I'm working on some disagreements for future. ;-)

Again though, I mean more directly. Loosely, this about detaching, seeing sensation as floating and unbound, such that this-moment and next-moment are not bound to be continuous. So what you say is the action equivalent, as it were.

POST: The Word

[POST]

The secret is in using the Word to regain power.
The Word being all arts, essentially. I am so good at creating stories that I have been duping myself with them for centuries.
Free myself,
And free all others
Through a story
That can be shared
It's all a story, so might as well write a _____ one.
Never title your story,
Until it is finished.
The Word is a powerful tool / Do not underestimate the power of the Word to heal and restore.
Restore emptiness.
We don't know know until there is a Word for it.
Feeling is Word Sight is Word Thought is Word Only peace is not Word Peace is Eternal God
The Word is a signpost to God, and from God to any experience.

Use the Word you want more of More.
Use the Word you want less of Less.
The Word is a focuser of divine Energy.
Thoughts are the subtlest and most deadly Words. Watch your inner monologue. Always be thoughtless when doing everything with the exception of thinking.
The World is already made up of Words all around.
The Word is Form.
I am.
Observer and Speaker of Words.
My body is a Word.
The Mind produces and is a Word.
I am not the Word, or any of them...
I am the Wordless.

[END OF POST]

Q1: In the beginning was the Word, and the Word was with God, and the Word was God.

Q2: Oh they do say that the Word was God? Interesting, I see it differently as though the creations are not in fact the God, but rather his creations and... yes I see this separation as a little artificial, but it helps to identify with the unlimited, as that is what we are, and it is easier to identify with form than it is to identify with unlimited freedom on a daily basis.
Still, I do see the Word as being potentially what we are - also perhaps we are the container of the Word? Thoughts?
Edit: Is the Word the container of the Word?

Yeah, true: it's not The Word was "God", it's The Word was God, in the sense of:

- God is a term for "the creator".
- The Word is Man's imagination.
- To imagine is to create (by triggering patterns, in experience, which subsequently reappear in experience).
- Hence, The Word (imagination) was God (the creator of subsequent experience).

But also, as you know, current experience is also made of imagination, so The Word is part of experience too, hence the "was with God" part. So God is everywhere and all things, He is the creator and the created, and all is imagination.

Interesting, see I was using the Word for specific creations, as though they were this separate aspect of myself (each image [or frame of existence] being its own "thing"). I can't seem to shake duality. There's always infinite me and then finite me. Or the "I am" and the picture of the "I am."

Well, that's okay.

The main sense is: Imagining something instantly triggers its larger pattern across time and space, which you subsequently experience. You may artificially consider a certain localised are of time-and-space experience to be "you", but you are literally imagining this to be so. It is just a subtle feeling-boundary floating in space, which has no effect except that it might limit what you allow yourself to conceive of. It's a worthwhile exercise to try and work out where, in your experience of the room right now, "you" end and "everything else" begins. Most people feel that, mysteriously, although they might be located in a small dot in their head (which is obviously not the case) they also extend to a spherical region outside their body (their personal space, again obviously not true).

Then: imagine something, any object, like an owl (my current favourite) and try to work out where that thought is bounded in time and space. To do this, you will first have to locate time and space. If you can't locate that, then your thought cannot be so restricted...

I say: Anything you imagine always and instantly triggers its extended pattern across all time and space. (EDIT: I see I said that twice. So I guess it must be important.)

"The Word of God is the Imagination of Man"

...

Great topic, /u/3man!

Both are releasing an idea into the sphere of experience. Writing something down can have such immense effects.

I say - symbols don't point us to anything, and we don't release things into the sphere. That implies a space and a place that doesn't exist. Anything you can conceive of can happen, because conceiving of something is it happening. A word is just part of an extended pattern, and recalling the word is to trigger the whole pattern.

Therefore, the symbol, or Word, acts merely as a reminder to the experience.

Right, but literally a re-minder. To activate that pattern in mind. It will then automatically appear in all your experiences. In fact, as soon as you have re-called a pattern this way it is instantly activated across time and space. You then encounter that pattern you have created, as you pass from moment to moment. It's worth spending some time attending to your actual experience, in terms of what it is made up from. For instance, see your visual scene as a "flat" drawing, an outline. Note that the patterns that outline is made from seem to recur, and once you have noticed a particular arrangement, you will see it again and again. This is the level that activation occurs at... absolutely all levels of a pattern are triggered across experience, from the abstract silhouettes to the relationship dynamics.

I suppose the caveat is that you have to have experienced something as it is, not symbolically, before you can use a Word to get yourself back there.

Well, if the word is meaningful at all, it is part of a pattern, and saying the word will summon that pattern. If you have any conception at all of something, you can have it. You don't necessarily need to have consciously (but which I mean, "have perceived sensorily") experienced it before. It really is beneficial to see your environment as a really simple, automatic "imagination space" which you are stirring around by activating patterns. Then it makes sense why you should occasionally sit down and stop "remembering things" - to let "the swirl" settle and clear.

Giraffes!

So, the extended pattern of "giraffe" has: the visual image, outline and silhouette, that camouflage, lock necks, hooves, zoos, tall trees, personal experiences in childhood, that story your mother read you, etc. All those will be triggered across time-space and be "mixed in" with whatever is already there. Even in very subtle ways, potentially. Such as the arrangement of a chair being like a giraffe, leaning against a table with a bowl of leafy salad. If you imagined the giraffe in a particular 3D location in your perceptual field, then you might tend to encounter animals with them being located in that same location in your senses. You get the idea. Note that when I say time-space, I mean that for convenience because that's how experience appears to be formatted. In actual fact, there is only this imagination space and it's all a swirl of patterns now.

But my question is, is every sensory experience combining aspects of previous sensory experiences?

I'd say all patterns are combinations - superpositions? - of other patterns. And there is always something in play. So when you bite into that alien fruit, then you already have the "formattings" of, say, "taste", "fruit", visual resemblance to other things, other things currently in mind and in context.

Right, so my problem is I keep viewing the pattern that I'm viewing right now, and the pattern that is hidden.

This is tricky to think about, certainly. Here's one approach: All patterns are always activated and always contributing to your sensory experience right now, to differing degrees. It is tempting to think that "giraffe" is hidden away somewhere, but actually it is to a very subtle extent informing your experience right now anyway. Your perceptual-imagination space is like a holographic space in which all patterns are present. "Remembering" or "imagining" is the process of increasing the intensity of a pattern briefly via attention/triggering. Once you've done that, it seems to dim from the heights you raised it to, but it is now contributing more strongly. If you held the pattern long enough, strongly enough, or with zero interference or resistance, in an attitude of absolute allowing, perhaps it wouldn't dim at all...

So to let the swirl settle is to "stop triggering" or "stop intensifying" by letting your attention open out and dissolve.

last night I had a dream that I went through this ritual of some kind.

That's an good one. Have you experimented with music-making while lucid dreaming? I was heavily into old synths and stuff for a while and had the idea that creating new sounds in my sleep would be great, but I never actually did it.

TL;DR: Think of all patterns as being present right now. Nothing is hidden or elsewhere; they are simply not activated at an intensity level that is noticeable.

EDIT:

And by "I became formless." I mean, I stopped perceiving myself to be limited to a physical body. Gotta' be careful with language!

Ha, yes. "I was no longer identified with form", "there was no longer any experience of being identified with form", that kind of thing. I know what you mean. :-)

A question: Do you feel physical bodies are a necessary tool - and if not, what are some good alternatives and how would I facilitate it/them?

Well, physical bodies (I'd say) are an experience. They consist of sensations and appearances; they are a pattern themselves. They are like the "first enabling technology". They are an excuse or a permission to have things happen, via "action". If consciousness is First Cause then bodies are not necessary for summoning change - all that is required is to intend. And neither is any other tool really. But in order to have an "experience of doing" then something like a body with sensations is required. That's the trick of this whole thing, isn't it? Some may want to be All Powerful and - well, you are already. But if you just went full out and had just straight-to-the-outcome manifestation every time, you'd actually have no experiences. So the balance probably is: be aware of the nature of things and therefore avoid undesired suffering, avoid accidental creation of misery, and knowingly generate desired change or leave alone and bask in experience. The most important thing: knowing this gives us the confidence to step back and just be and allow. Without this, we feel we must interfere and "make things happen" all the time, often with accompanying ongoing physical tension.

Some limitation in certain instances allows for some very unique expressions.

Limitation is often a source of creativity, right?

As a minor example, if there was no "gravity habit" then animals and objects wouldn't be shaped as interestingly as they are. No need for legs and motion-generating structures and the like. If we didn't "need" to eat, then a whole source of pleasurable activities would be denied to us - etc. And since you are never actually physical (you are just having sensations, thoughts, perceptions consistent with - "as if" that were true), you get the best of both worlds.

I feel like I'm going to enjoy life a little more now

Aha, then my work here is done! :-)

The balanced view is to go "yes, it's an imagination room" but life is about experiences, and immersing ourselves in them. Yes, I can use fast travel to jump between desired circumstances, but once I'm in one it's fun to let it play out. Doing these things knowingly rather than accidentally is the benefit.

Additional thought: Just as an aside on this "words and patterns" thing (triggering, autocompletion, and all possibilities already being available), it's interesting to compare what we're talking about with older descriptions - e.g. Akasha ("primary substance") and the Akashic Records (random link - all experiences have already happened at least as potentiality, as patterns). Even current metaphors such as "it's all a computer simulation" are really just another way of saying: the whole of infinite reality is "encoded" into the background; your current sensory experience isn't "solid" like you think it is.

POST: Choices, choices... Symmetry vs asymmetry in a worldview.

Note sure if this'll make sense but -

Can you get out of this by identifying with the "ground of being" (even just conceptually) and seeing Nefandi and Everyone Else as on the same level? As the ground, you are never elitist or non-elitist. If Nefandi plays the "educating" part or not, it is of no consequence in the larger play. Nefandi is not Godlike, but you-as-the-ground is. Nefandi has no obligations to educate unless he is so moved. And when he is so moved will be when it is the appropriate thing to do. Because the ground will have shifted him.

Y'know, maybe this is an intuitive timing thing.

...

Well, I tried. :-)
It's not an easy thing.

...And the answer is... dream-cake!

Inevitably. But maybe the idea that you have to choose is wrong. You can flip between Nefandi and The Ground and between one approach and the other. Maybe the problem is in felt need to choose? I'm a strong opponent of the need to "have an opinion" in times when you don't actually need to act upon a view. I'm sort of "being the ground" but guiding the experience as TG. Sometimes one thing seems appropriate, sometimes another. Usually neither was appropriate. ;-)

You are the All-Knowing Nefandi - He came from The Ground, and The Ground arises within Him. There is nothing He cannot accomplish in His World!

Maybe. ;-)

POST: Controlling feeling vs controlling material form

The idea I have is that the feeling is what is generating the vision and other forms.

It can certainly lead the other forms, and if you don't have the associated feeling of a form (what you might call the "feeling of fact" since it doesn't have to be emotional as such) then you haven't completely created it. Following on the Patterns post ideas, if you summon a particular feeling then you trigger the patterns associated with that feeling. And certainly if you behave "as if" something then that does the same thing: you are creating direct sensation which bring about the related experiences. Basically, directed dreaming. In the end, this comes down to the usual: assert new "facts", in any way you feel inclined, and the world will being to behave as though those "facts" were true: e.g. When imagining things, messing around with the sensory aspects directly is very inefficient and actually inhibits progress. Instead, imagining that something is true, the imagery follows automatically (provided you don't block it). This is equally true of world manifestations as mind manifestations - because they are the same thing!

If you go about the place with the constant feeling of "it's it great!" then the world falls in line with that in a general way. In fact, one of Goddard's recommendations I think is that if you can't visualise well, you can simply say "it's so wonderful! thankyou so much!" and that will generate the appropriate feeling - which in turn will produce the results because it inherently "assumes the wish is fulfilled".

EDIT: Worth taking a look at the Michael Chekhov acting technique if you'd like to expand on your "embodied imagination" (acting as-if) approach.

Let's talk about blocking it. For the most part I know how to handle my sensory blocks. What could be done in the event of this feeling-as-fact block?

If you can't get at it directly, you approach it by accepting something that implies that it is true. Bad example but: You don't believe a door can be opened. Can't get the feeling. So instead, you approach by asserting someone being inside the room, which implies the door must be openable, hence you allow yourself to have the door openable. You lead in to plausibility.

We can get away with simply feeling how we would expect to feel during these experiences and then being detached from any expectation of what happens

I dare you to do that without actually triggering the larger pattern and essentially "asserting a fact" after all! ;-) Really they are all versions of the same thing, right?

Asserting facts is basically pattern-triggering. You can't assert something you can't conceive of, so the pattern must already exist in some sense. If it exists in some sense, then it is like a memory pattern. So really - everything I've said is the same thing from different angles. Sometimes I chunk it up into "moments", sometimes into "patterns", sometimes "facts". The underlying is of course undivided - but we need to select an entry point in order to conceptualise an intention and make a choice. Going about your day, just maintaining a feel of expansive space, and the feeling that goes with how you want your life to be, is alone a good idea. And ties in with...

Going to read the Michael Checkhov text, looks interesting.

Yeah, it's really just a fun thing on its own.

EDIT response: So if the context of that was "I want to imagine a spaceship in front of me" (as in: visualising stuff in your mind), then trying to "draw" the object in the air isn't a great way to do it. Just as in daily life, sensory imagery arises from fact. Assumption implies creation. So an alternative is to "decide" that the visual object is there, make it's presence a fact, and have the imagery arise naturally that. It's similar to the "trigger the pattern by the feeling" thing. That's what happens anyway once you get good at picturing stuff: You let "the unconscious mind" do the work for you. This is a way of short-cutting it. It's just a suggestion. I found it helpful. See if it's useful for you.

Ah I see what you mean. Know it's there but I just can't see it yet. But then how do I give myself the ability to see it? I know the answer is just decide to.

It'll just "come". You have to let it happen. It's a bit like the "let the world come to you" thing for the senses, rather than trying to see with "eyes" and hear with "ears". Play around with it. It only really makes sense if it happens. Sit back, and decide that a large model of the Millennium Falcon is floating a couple of metres in front of you. Let it appear in its own time.

...

My interpretation of Mr Goddard is that, having recognised that the world is made of imagination and operates on an "as if" basis, he understood that we simply need to re-imagine it. The Law and the Promise is a little clearer on this I think. Changes thus instigated could potentially manifest (persist sensorily in awareness) instantly, however the intensity of the imagery we have created thus far tends to result in an apparent time element - i.e. it's easier to create changes that are "out of sight" sensorily and in terms of current event momentum, than it is to "condense" a new environment while we are looking at that implied time-space place.

POST: The greatest possible gift.

Lovely. Are they there to listen, though? I suppose it doesn't really matter: at worse, you are reclaiming your power from an illusion of separation from the dream. You are giving to yourself, as you say. From experience, lots of people don't take kindly to having their... ability pointed out to them. Getting people to create synchronicity for instance (I used to use elephants, now I use owls as the example, inspired by a book) often gets a quite traumatised response. Not so much that things appear, or that reality might be dream-like. What troubles then is that it mean that other people aren't straightforwardly real - that the "sharing model" of the world can't be a simple one. Now (as is the way of these things), my own expectations play back to me in this as much as anything else. Interested in how other people get along with that. You can also do it indirectly, but you are basically being sneaky to yourself if you do that, of course. For sure (on the forcing) but these are people who ask... then receive. It's an interesting muddle. Well, it's mine to allow myself the experience of them apparently having it!

...

Quite so. It's a funny old world. Since everything behaves "as if", including time and space, apparent history and apparent persistence, how it works it can't really be explained, only asserted. I mean, it's funny trying, but it's also like chewing your own arm. (And everyone else's arm, therefore.)

Hence "Active Metaphors": the explanations you absorb shape your experience. We do quite well, on this subreddit, considering there nothing to say really, beyond things like "how you imagine it is, that's how it is" and so on.

...Yes. And I guess there's lots of work to do towards being able to describe something like this, in ways that work for different audiences. There's always something new to say about something which shifts a little every time you say something about it... It's a way of continuing to experience it freshly, I suppose. Like re-watching a favourite movie. Or reading another Philip K Dick or JG Ballard book (because they're mostly essentially the same).

POST: [deleted by user]

Just happened to be passing! It's a great topic and something that there are so many ways to talk about. A good one to bring up. So:

- The "you" I'm referring to in the first example isn't the "little you", the one we infer from thoughts and bodily sensation, but rather the true self: the conscious environment. I guess I'm assuming in that phrasing that people already recognise themselves as the "open aware space" in which experiences arise; that they are the dream.
- But then in the second example, when I make the dream-space reference more explicitly and say there is no "you", I mean "you" as in the "little you"!

The way I'd written the comment appears that they are different views, but really they are the same view. A good example of why we have to be careful of language here, I suppose! :-)

Actually, in the "filtering of infinite potential" metaphor, that you are experiencing "your own mind" doesn't necessarily imply there is no valuable information to be had from the environment. Because we have the perspective of a "little you" who receives information by sensory arisings, the way we learn about ourselves-as-the-world is through experience. So listening to people, paying attention to events, tells us who we are at the moment. For instance, seeing lots of news articles about people having appendicitis may be the first sign that you should get checked out at the doctor. It's not just all about seeing owls because you've been thinking about owls, or redirecting events by reconstructing your forward imagery. Meanwhile, changing ourselves and changing the world are equivalent, and we can only recognise our success in that when our sensory experience shifts accordingly. Again, active and interactive listening.

- Experiences are all about your current state, because the facts-of-the-world are your current state.

Taking the "two aspects" version of Transcendental Idealism, you would be the noumena (as I call it: the facts-of-the-world dissolved into the background of awareness) as much as you were the phenomenal (those aspects of the noumena that had unfolded as spatially-extended sensory experience: an experiential moment). Both are in and of awareness; awareness is what you "really are". In fact, the noumena is always as present as the phenomena, it's just that it is dissolve into the background felt-sense.

- You = world = state of you = state of the world.

To explore the apparent sensory world is to explore the current formatting of your own mind, and I'd go further and say that the overall formatting is just as present now as the particular element you are experiencing as an expanded environment. Behind that is just infinite potential.

TL;DR: The filter+potential metaphor shouldn't be construed as one-way, because it's a metaphor describing the current state of the larger "you". The environment you encounter then is the larger you, and to explore it is to explore the larger mind, so one should always be listening.

A1: Metaphors abound. Worldviews are like contortions of the body. You bend to them when you wish to be bent such a way: you sit when you want to sit, you stand when sitting is no good, you lay down when you need to rest, you run when there's a tiger. Anyone who sits forever, or lays forever, or runs forever, is either dead or effectively so. Flexibility. Always flexibility. Adapt, move, never holding on, never saying "this not that" for long.

Quite so. "Active Metaphors". Choose for purpose. Don't confuse with explanation.

A2: in a response to a recent post /u/triumphantgeorge outlined a model of reality in which there are three features: a you, a filter, and a world. This isn't a fair representation of what George talks about because "the world" is not what you're filtering against in his model. Rather, you're filtering from infinite possibility, which isn't any kind of world. Once you're done filtering, then something resembling the world appears to your mind as your POV experience. Of course the filtering is instant, so "once you're done" is only a figure of speech here. One of the dangers is dismissing the possibility that the other elements in this system, ie the world and the filter, might have something to say, that they might have their own agenda, intelligence, or reasons for appearing the particular ways that they do. What's the danger here? When you talk about danger, you have to talk about the possibility of injury. Who is injured here, how, and why?

Thanks Nefandi - this is exactly right.

POST: dream poem

The Oneironauts

Expert navigators of the waking dream
Trajectories across the Infinite Grid unseen
The generators of fact
Making this out of that
Implied Creators of their world
Senses, effortlessly unfurled

Haha, and of course it also includes T-G's patented private vocabulary words and terms of art. :) I even know what some of them mean. I only know what "infinite grid unseen" means because you explained it to me.

Yeah, I should really have included the ©appropriate™ symbols® in the text, I suppose. :-)

EDIT: Although really, being a poem, the idea is to be evocative in terms of imagery, rather than necessarily precise in terms of exact (conceptual) meaning.

You're talking about something with a specific meaning, but unless people were following the right posts where you explained some of this stuff, they're going to get vague imagery instead of exactly what you're trying to say.

That's fine. These things have poetic meaning anyway. I think anyone could read that and would get a 'feeling'. The fact that there's further theory behind the imagery, is extra icing to be discovered.

After all, why does everything have to be easy? :-)

Q: The fact that there's further theory behind the imagery, is extra icing to be discovered. That's one way to look at it. After all, why does everything have to be easy? :-) How would you like to be on the receiving end of such an attitude? :)

In fact, the poem is more factually correct than the theory.

Because it's pure aesthetic and the theory is not?

Try and argue with my poem! :-)

I won. Did you see it?

From now on, I only understand victory in limerick form.

POST: How feeling the emotion of lust affect my reality?

Approach it in a more literal way, perhaps. What exactly appears in your experience - what is the "shadow-sensory" arising and the associated meaning - when you "lust"? However you answer this, that is the pattern that you are triggering into your world-experience subsequently. Say you are lusting after owls ("twit-twoo, what lovely big eyes you have"):

- If the experience of that lusting is: "a 3rd-person image of an owl far away, and the feeling of hopeless distance" then that is the pattern you are triggering for both internal and external experience.
- If the experience of that lusting is: "an 1st-person image of my owl friends all around, laughing and feeling thoroughly feathered" then that is the pattern you are triggering for both internal and external experience.

The process is far more basic and "automatic" than you might think - ironically, because there is no mechanism to it. You aren't making changes in a spatially-extended deeper world, you are creating ripples in a pool. Just make sure the shapes you are rippling are nice ones, because they will persist in as superpositions in subsequent patterns.

In other words, the actual imaginative content is what matters here.

...

Perhaps right now, in a million personal reality-dreams, a million teenagers are waking up with a million Amanda Seyfrieds by their side! Or whoever. :-)

There's also the case that we are talking about superpositions of patterns. What other things have you put in place? And what is the implied "meta" aspect to the imagining; your implicit view of what you are doing. If our teenage boy has this fantasy is he implicitly feel-thinking "oh wow this is amazing and so unlikely" or is he feel-thinking "yep, here I am, all is as it inevitably was-is going to be". There's a lot to be said for taking the attitude that imagining something is the experiencing now of a fact that is actually in place in the future, now. That meta-view is also a pattern linked to the imagining.

...

So you're not going to a cartoonish fiery hell, and you're not wasting some secret energy in your testicles or ovaries, and you're not just from lust alone going to be reborn as an animal. Etc. All that is bullshit.

Good response. However, you may well be going to a "cartoonish fiery hell" - because it's not just only about the triggering by intention (the part of reality you shifted) it's about what that implies in terms of world-as-defined-so-far. Having already implicitly intended that the existence of a cartoonish fiery hell, it is in fact there waiting for you right now, its hand-drawn flames licking at the edges of your future cel-f.

You can achieve such a state, but the requirements are too high for mere mortals.

Yeah, but OP won't be (apparently) mortal forever, is what I'm saying... and by implication he might already have created his "cartoonish fiery hell" as the next-moment beyond his last this-moment in the set of "plausible moments of being a person". Ouch.

He'll stop being an ordinary mortal only when he decides it's time and takes specific steps to that end. Assuming it's a he. Of course sex/gender doesn't really matter in this discussion.

I don't think you need to deliberately decide. If you run out of plausible human trajectory you might have "the experience of dying" and then end up somewhere else. Just as OP confuses himself with being a "human" now, he might confuse himself with being a "something-else" later. Something in a very hot place where people carry forks.

You're more likely to be reborn as a glue-sniffing orphan in Moscow who has to get raped in the ass for a few bucks to survive, and dies of gonorrhea early in life. That's drastically more likely than fire and brimstone hell with all that this would imply. Even then, we shouldn't assume orphans have done something bad in their past lives, or we won't want to help them. Basically "hell" is a bad idea every way you look at it. Something like hell is possible only for the best of beings, not for humans.

I was discounting the idea of rebirth here. I was suggesting that experience of some sort always continues. And if you've already thought a lot about it being a hell-type situation, then that's what you'll get. Like opening a door and there being a landscape beyond. It's not a conscious selection at the moment, it is creation-by-implication. OP is going to a big cartoonish fiery pit of doom, because at some level he has implied its existence. Sizzle!

And this is rebirth, with which I agree.

I prefer to say that "experience continues" because it's not burdened with any assumptions about reappearing as a human restart on this planet (which implies a persistent place with a persistent timeline or history).

If this were true, then just thinking about psychic powers would get you functional psychic powers. That isn't how it works.

The difference between our hell situation and psychic powers is that in the latter case, the gap is already filled. You already have that part of the landscape filled up. In the case of the post-death scenario, we're dealing with pure creation-by-expectation to fill the gap. And why do you think that thinking about psychic powers can't get you functional psychic powers? What if you thought an awful lot about them?

I am saying humans generally remain humans indefinitely unless something interesting happens

Why do you think this?

I do not think we become an animal or whatever. I don't believe that the human lifetime plays out as a timeline, even, and that it contributes to some development of state. If you are in a car crash, you are just as likely to suddenly not have had the crash, or to wake up at home in bed from "a dream about a car crash", as you are to be "reincarnated". Your person-experience is within and of your conscious perspective. It is not something you are. You are not bound to it in some biological karmic way. Which actually means you are more likely to end up in hell than if you were in a Christian or Buddhist type world.

Thinking-about doesn't produce sufficient intent.

How true. But where there's a will there's a way, and thinking-about is a nice way to make yourself aware of specifications, for the fun. But the will is as much about clearing out opposition than anything else. There is no opposition lying in wait when you hit an experiential end-point. The next-moment will happily provide itself. So the comparison is not valid (between post-death-moments and psychic-thinking). Okay, let's recontextualise a little then, just to keep ourselves on the same page: On time (as experienced, not as a larger context since that doesn't exist), let us for convenience declare it to be all present. It is not true now that I am F&BH then, but it might be true later that I am in F&BH then.

Rebirth is even moment to moment, breath to breath.

Well that can get all a bit picky. Let us declare each moment "fresh" in that case.

Secondly, I am saying the general shape of your landscape, and its laws, are not arbitrary.

They are accumulated. You are making my point for me somewhat: that any next-moment will be consistent with the structure of the landscape. However, if your landscape includes the concept of a F&BH then it is reachable. It is part of the laws and is not arbitrary.

I am not suggesting that just anything will happen next. What happens next will definitely "make sense".

But your intent is more profound than just the body. Think: in dreams generally physics remains identical to waking.

Ah, right. You see, I'm not thinking of this stuff to be related to the body at all. The body, thought, the environment, they all arise from-within the "world-pattern" and consistent with it. By which I really mean, the very structuring of yourself. Like the Imagination Room metaphor from before, where the swirling patterns dictate the entirety of experience, which includes body sensations and so on, but everything else.

There is no end-point. [experiential end-point]

I agree with this, I was meaning when you run out of a plausible story for the continuance of your person-in-a-world experience, so there has to be some sort of discontinuous change (apparently). For example, you have that car crash, you fly through the window and get diced on the grill of the oncoming truck - the body as conceived of is definitely destroyed in this dream. So, here you are without a body... what experience arises next?

What "makes sense" as the next spontaneous arising?

The next-moment provide itself as in, the accumulation of observations so far (the patterned state) implies a next experience which arises, even though you don't "deliberately" choose it (by weighing up options).

Moments tend to resemble each other. For particularly small moments of time it's accurate to say for our current style of mentality that they're more alike than different.

Yes, agreed. When I say "fresh" I just mean we can reconsider each one in our discussion. Each next-moment is similar to the last for as long as their is a plausible story from this-moment. If not, there is inevitably a discontinuity (apparently). This does just happen randomly though; the next-moment will make sense in terms of the broader pattern.

They're stored in your intent.

Okay, I think we're getting somewhere: you are viewing things a little differently to me. I don't see it as having "my" intent. All intending affects the actual world-pattern. Not "my" world-pattern but the actual world-pattern. At the very moment of intending, my intention is superimposed upon the actual world. All subsequent experiences will then be in alignment with that modified (really: superposition) world-pattern. So in physics a superposition of patterns is:

pattern1 + pattern2 + pattern3 + pattern4 = Total Pattern

Hence it is both an accumulation and a transformation. There is no sense of separation in the overall pattern. Each addition of a pattern transforms the total pattern. However, in this example we're not really talking about something that corresponds to your sword metaphor. Because the sword would be a single pattern or intention that was being modified; the patterns I was talking about "superimposing" are different intentions on top of the world (e.g. Nice new hat + meet my friend + sunny on Tuesday = Nice Week).

World-pattern arises in the mind and nothing arises in the world-pattern.

The world-pattern here is everything. You might say that at any moment one particular part of the world-pattern is "lit up" (appears as senses) but it is always there in awareness. Like (reusing an old one) the sun in the daytime sky, where the sun's brightness conceals the other stars that are there. If one could select which star to become "the sun" then that would be apparently evolving sensory experience from a fixed world-pattern.

Agreed 100%, but what happens after the context bursts is not arbitrary.

We are agreed. One of the points of a world-pattern is that it is a structuring of experience. The next-moment always "makes sense". That doesn't mean you can't end up in hell, though, if that is your natural understanding of what happens after you "die". For something to exist in the world-pattern, it merely has to be conceived of. The only difference between a thought of something (a "shadow-sensory" experience) and a dominant sensory experience of it, is intensity.

Your propensities are "stored" in the mind as your intent, and intent doesn't become destroyed when the context is no longer plausible.

This is what I have been calling a world-pattern. It is both the memory storage and that which is experienced. Sensory experience is merely a triggering into the senses of certain patterns within the world-pattern. All thoughts and observations are therefore already present, either actually or logically (there is no difference, or at least no way to distinguish).

In other words, to jump from humaning and physicaling to F&BH is a task for the best of beings, not for normals.

I'm not suggesting you lose your human-formatting, although you might no longer experience a body (which is fine, human-formatting is about sensory profile not content).

In my view there is no "actual" anything. The world has no pattern of its own. In fact, there is no world at all.

Nothing has anything of its own. I'm not talking about a physical, spatially-extended world - I'm talking about that structural pattern which is basically the "definition" of possible experiences. In short, the "world" that you experience. This is exactly subjective idealism. There is no structure outside of this, this is everything: the entirety. It is within you and it is you and so on. It is the constellation. You are the stars. Blah. Let's just cut to something: Obviously when we are discussing this stuff we both realise that there is no division between context and content, experience and experiencer, and so on. To discuss it is to separate it temporarily into parts; plainly this is not the actual situation. By naming something we inevitably imply it has a separate existence. This is the problem of thought, which comes to use as a "shadow-sensory" experience. It requires division, relative location, and temporal separation. Conceptualisation inherently means fragmentation of the subjects, when of course it is whole.

When I dream I see different world-patterns, but they all share similar rules of physics. So it's possible for world-patterns to change but for the general rules to remain.

The world-pattern contains all worlds. It is the very structuring of your experience - the world of experience not "Planet Earth" or "this dream" or "being this person". Strictly speaking it cannot even be referred to as a configuration space. As mentioned previously, it's basically a memory-block. Memories are triggered associatively; new memories overlaid; etc. But any metaphor cannot capture it, for it is all "ideas".

Here's why you talk like that. You associate intent with effort and struggle. Struggle is clumsy.

No, no, no, **I don't associate it with effort and struggle!** Damn you! ;-)

The apparent division between "on its own" and "intervening" is simply to convey that no ongoing maintenance is required - that one needn't be constantly "doing" your experience - and that you can gently redirect it as desired, occasionally. Now, in the final limit what is happening of course is that it's all you, you are the ongoing movement and you are the shift in movement. But that's not very visual or useful way to describe it from the outset. Again, it's back to the "there is no division, everything is consciousness" formulations which are of no use other than something to remember as the fundamental.

No struggling for me, kiddo!

Okay, on "optimising for influence", that's exactly what I am pursuing. And I think of it as better to have a situation where experience plays out and one only need occasionally "decide" on what you want the world to be like. Not even "what you want to happen" - rather, what you want the facts-of-the-world to be from this point onwards. Effortless is built in, you can't get away from it, if you're going to take your stand as awareness, rather than as body muscle and tension and resistance. Change only happens when you are relaxed or have reached a point of effective relaxation (via balance). World-pattern is in the sense of your private world. It has nothing to do with planets. It's more properly called, perhaps, your private extended definition of your universe, or similar. However, it's a completely generic arbitrary associative and generative patterning system, so it's more like a memory landscape. Very true about quick typing and then subsequent edits. Things sound right as you type them, and then realise it's not quite right, or is a statement too far from what we intended. When we're having a "live" discussion, probably best we draw attention to a revised idea in the next "live" message - just as we would in real-life dialogue?

So, I'm really not getting across what I actually mean with this intending, deciding, happening business - because you are responding with words like "passivity" and so on. The sense in which I mean it is (referencing earlier) a frictionless environment. If the floor in my house had no friction, I would simply "decide" to go to a room and even the tiny shift in weight distribution brought about by the mere thinking about it, would result in me going there. Just thinking about a location, I would find myself there. Now, if it takes "time" for the shift from here to there to occur, I could change my mind and - simply by the changing of my mind - end up in a different room instead. In neither case would we say I was "passive" but nor would I need to "maintain" a particular decision. The fact of the decision would have altered things such that I was going to the room in question.

(Now obviously our metaphor requires a separation into parts which do not exist, but it illustrates the point. With no friction, no inertia, once a destination has been brought into mind, it will remain in mind and be effective, until adjusted again.)

What does the "memory-block" look like? Nothing. Time and space are aspects of particular experiences; time and space are themselves contextual patterns. There is no "outside" to the memory-block and no time. If it changes, the previous state no longer exists and never did. The notion of "pattern" is obviously a concept to describe something that in an of itself has no properties. We might think of them as "dimensionless facts". If you can think about it, it's not it, but we are choosing to think about it. Take a pause right now, and recall the memory the last time you were at a party (say). Where is that party now? Where was the shadow-sensory image of the party, before you recalled it right now?

The best you can probably say is that the memory - like the non-unfolded-sensory world - is a background feeling. So the memory-block "looks" like a feeling.

Part 1/2: Response

In your example you'll spend quite some time drifting through space before you reach your destination, assuming you only used a tiny shift in weight.

Quite so. Just as in real life. If I intend a result, events fall into place over time which lead me to my destination. The stronger the shift in weight the shorted that experience would be. All analogies have limits, but that's not a problem. That's what analogies are. You're not trying to capture the whole reality because only the whole reality does that. You're just trying to capture the feel of a certain aspect. In your analogy, I actually don't understand what you're trying to say. In what way am I at the middle of a hill or the top of a hill? What are the heavy balls? What does deflection mean?

It sounds like things are "coming at you" and you are constantly in a battle against circumstances. And that circumstances are separate from you. And that it's possible for something to be "out of reach". And so on. It doesn't present a model of that "the world" is. But all we're pointing out here is that metaphors necessarily draw upon "everyday world" experiences (physical objects in spatial arrangements unfolding over time) and so, quite reasonably, can only capture a part of the whole picture. There will always be a problem with a metaphor; what matters is that the problem is outwith the main property that's being illustrated. This does mean that the complete set of illustrative metaphors do inevitably clash; just like the physical theories of today.

In practice you can have 10% of your mind agreeing and 90% disagreeing, because it's easy thanks to habit and other factors to keep the old patterns. You have to convince all of your mind to get on board

This kind anthropomorphises "mind" which is really just a structure, but I agree with the idea overall - one might call it "coherence" or something like that: the clarity of the mind really.

I get this, but there is no analogy for this. This is a unique feature of the mind for which there is no analogy.

Yeah, it's unexplainable as an entirety, only aspects of it. However, "remembering" is something most people have had an experience of, and have a mental model of, so it's quite a valuable approach.

should be explained straightforwardly.

There's no such thing. There is only metaphors. No matter how you try to explain something, if you are doing it in terms of something else (which you must do if you are explaining a new concept to someone), then you are using a metaphor.

OK. Just do me a favor and don't use the word "pattern" for something that has no shape. If it's a pattern it has a shape. Patterns are recognizable and are identifiable.

What is the shape of a memory-pattern?

Part 2/2: Back to Basics?

1. A Return To Here

But all this, this metaphoring, is simply more imagination on top of the already-imagined. The risk is that we are making things far more complicated than they need to be, for not a lot of additional benefit - practically speaking, but perhaps also in terms of understanding. So let us return one again to our immediate experience: the current single sensory state in awareness. (We've been calling them experiences or moments and so on, but the word "state" gets to it. What is true is this state, now. Note that by "sensory" I don't just mean visual-auditory-texture, but the whole sense of being-in-a-state too.)

- Every moment brings a new state, the incorporation of an additional fact, which persists unless amended. Isn't that all that's ever happening?
- The changing of the state is what we call the passage of time, if a residue of the previous state is incorporated into the new state. (This is not necessarily the case.)
- We direct our experience by imagining occasionally - creating additional "facts" - but most people do this in reaction to appearances (the facts so far) and within the limitations they suggest.
- The Insight Of The Oneironaut™ is that you can create any state you want by imagining new facts, now, without limitation. What you see-now, and what you think-now that you have seen "previously", don't necessarily matter.

2. Further Discussion

However (and this does maybe tie into what you are trying to say with your "ongoing intention", which I don't think we clash on) - if you are holding onto a particular fact then that remains part of the state even as the rest of it changes. For instance, time and continuity are ideas, albeit ones that are not seen-heard-touched. For as long as those ideas are active, they are part of the imagining you make, the continue as part of the state. If you change the body from a seated to a standing position, but hold onto the muscles in your hips, you either end up rising slowly (best case) or will end up in a half-seated half standing position (worst case). This is a bit like your "10% of your mind agreeing and 90% disagreeing", perhaps?

Then:

- To make massive changes, then, you must detach almost completely, to allow the whole state to be reimagined or reseeded. You basically need to "stop thinking about" other stuff.
- Every thought or metaphor we come up with, is simply further structuring our actual experience. We are basically creating more observations, more partial facts.
- So... is the best approach not simply to imagine that there is only this current sensory fact, with nothing at all behind it, and no mechanisms? Even contemplating "how intention works" simply hobbles the simplicity of it.

Returning to a quote we were playing with a while ago:

"However you imagine that it works, That's how it works." -- The rule of metaphor

In other words, when we create metaphors we are not thinking about things exactly; we are thinking those metaphors into actual existence. When we imagine something in the 3rd-person, we are literally creating a model (like: painting a new picture). If, in addition, while we are doing this we imagine that it is how the world works, then we are making the world work that way (like: re-painting this picture). We might consider "this world" is be a painting we are focused upon. In error, when people use their creative power, they usually create or amend other paintings to the side, rather than making alterations to "this world". They keep making more and more paintings "about" this world, in the hope that this will alter this world. But unless they declare equivalence (which is what magick does) it only has partial effect.

[Your conical hill metaphor]

This seems to imply an idea of a "momentum" and some sense of "proximity", neither of which I'm keen on. But probably the root of it is: I'm perhaps not talking about a "universe" in the same sense you are, maybe (see later). Return to that later though. To clarify now, just so I've got a better idea of what you are actually meaning, rather than just what I suppose you are meaning:

- What does it mean, for a ball to roll to the other side of the hill?
- What does it mean, for phenomena to have "steam"?
- What is this "steam"?
- What is the starting point for a phenomenon?
- What do you mean by "originate unconsciously"?

The problem is when you use an analogy and don't specify what you're trying to illustrate and where the limits lie.

I think you have just illustrated this! ;-)

We don't ever even want to try to describe something ultimate.

It can't be done because it is: a) not divided into parts and can't be conceptualised, b) any conceptualisation happens within the ultimate. I think we do know all truth, right now. Know it and directly experience it. That is different to experiencing the "unpacked" aspects of it, however. Right now, the world is within you but you-as-persepective are not experiencing all possible viewpoints visually, of instance.

Ultimate truth is a truth about other truths. It's meta in level, and is not usable directly by itself.

A good statement. Saying "everything is and is made of consciousness" implies certain approaches, but in and of itself it says nothing. Like "everything is one" and "all is illusion". Okay great.

The reason I said that is because you've been using world-pattern a few times not to mean something with shape, but to convey something shapeless. That's confusing.

It does have "shape" however it is not a shape in terms of spatial extent or a visual shape. The word "form" could perhaps be used instead; a non-sensory form. The issue here is that our descriptions and metaphors require a shadow-sensory experience - we think my creating shadow-worlds with shadow-objects and relating them. Since this is the thing before even that, it's obviously pretty difficult to describe!

Was watching some videos lately (pondering my other interest of physics metaphors) and Larry Susskind in a talk put up a slide of an interference pattern of a hologram (basically, the incomprehensible swirly pattern which when illuminated by appropriate light results in particular images). Here is the link to where that pattern appears. That is one way to visualise "memory-pattern". It is essentially information dissolved into the background. You might say we experience it subtly as an imperceptible "global feel" normally, and when we go "illuminating" we experience the unfolded image.

As soon as I gave the metaphor I also criticized it soon after.

Uh-huh, I'm agreeing here by thinking aloud, not picking new things. Okay, so proceeding from your other responses, you are "cutting up" experience a little differently to me. For instance, there can be no "Other" since everything is "here"; what you call "steam" is just more established pathways; but the root ideas are probably the same. More important though: You seem to be viewing not doing something as "intentional". Isn't this a bit superfluous? I'm never "not doing" anything. Experience arises, I might interfere, but if I don't then I'm not "not-intefering".

It means you relate to origination as something outside your subjective sphere. Since it's "out there" it can only be unconscious.

What can there possibly be, outside my "subjective sphere"? It's not enclosed - so no sphere no "outside". Isn't that fundamental to subjective idealism?

To say that the ultimate is not divided into parts is already a grievous error.

How can the ultimate be divided into parts, fundamentally? It can be conceived of as being divided into parts, however even that conceptualisation will be of whole cloth, a fiction of division.

A form is something with an outline. If it has no outline, it's not a form.

The distinction to make is between something as experienced and something as it is "in itself". For example, a triangle definitely has a form, right? Here is a triangle: image and here is a triangle: {(1,2,1), (5, 5, 5), (10,2,5)}

So you're saying "it's out there." I can't agree. :)

No, everything is "in here", or actually neither inside nor outside because there is neither. :-P

To return to an analogy you've used: the fish not knowing what water is. A problem with conceiving of our situation is that we are not like the fish; we are not "in" anything. It's more like water not knowing what water is.

So for example, if I select a big red six sided die, that preference is not stored in the bag, so can't be in there.

Both the choice and the bag exist (as far as they "exist") inside you. For fun, we sometimes call an object with us "me" and pretend that it does things like looking at options and making choices, but really that is all just play-acting. All of that sits at the same level.

Are you aware of non-implicative negations? And the only way to be free from error is to become familiar with many many many errors

Not this, not that. The term is new to me though; I like it. So really the only way to become free from error is to... step back and realise that errors are just like everything else. We might decide to do this or we might be driven to it by sheer exhaustion.

[No, everything is "in here"] Not everything. :) You aren't here.

Haha, well of course I'm the only thing (which isn't a thing) which isn't anywhere at all (and yet is everywhere). And so on.

That's still not everything. Where is my next choice?

As soon as you have thought of it, it is there also. The thought of it is it. Until you have thought of it, you don't even know you don't know (so to speak).

We take an object that's with us, and we split it into me and not-me. But all that is arbitrary. Both me-ness and not-meness are mental fabrications.

Yes, they are fabrications. Are you suggesting, though, that these objects which your are identifying with, were not created by you? And that you could not create another object now, and identify with it?

The study of the world and of oneself is literally the study of error.

Do we need to study the error, other than for interest and amusement? Can we not simply identify with the background (as it were, knowingly the mistake) and view all identification as "error"?

Where is it before I have thought of it?

Until you have experienced it ("observed" it) there is no such thing, except as implied by previous experiences. However even contemplating the implication brings about the observation. You can retrospectively imagine that it was there all along.

It's actually pretty claustrophobic. You can't see around the edge, as it were. You can't catch sight of the pre-sight situation - because there is not one. You can only conceive "that there is one" (which is really to say that there will be one).

Slow changes are easier. One-offs are easier than repeatable functions. Shallow changes are easier.

Let's return to that. "Why" is this so?

This kind of lazy heuristic is no substitute for the actual wisdom.

But if the "actual wisdom" is wisdom of a relative sort - one part of the world experience as contrasted with or implied by another - then what fundamental value does it have?

If wisdom is content then I can change the world within me and make it obsolete. I am the constructor of wisdom, then; wisdom is an experience which arises within me (a "me" which is before structured knowledge, being simply "being").

If something is non-existent, how can I think of a concept that doesn't exist?

You can think of the existence of something. For instance, you can think of the train having a driver without thinking of a specific driver.

I agree with all the rest of it, that's my thinking also.

Fundamentally, you just can't get "outside" of your thinking-about, you can't be further along the road than you actually are until you get there. We can conceive of the fact of their being a place for something - slots in which things should appear - ahead of the encountering, but we are just thinking stuff.

You can know the teleology of your will.

As you say. As to "decisioning" there's a case of describing all "observations" as happenings because it gets rid of a load of dubious abstractions - for starters, it means we get away from the idea of there being persistent things that are "occurring" in some defined way when not being observed - but we've implicitly covered that.

So slow changes are easier than quick ones because I enjoy stability at all times...

The discomfort of discontinuity! I think everyone has this. Anything is possible, but the implications actually acting upon this can break your reality quite badly. For instance, a friend dies in an accident. You summon that fact from the background and you change it. You go to the bar that night and he's there as if nothing happened (which, now, has become true). How does that really work out for you?

Even much less dramatic alterations bring with them certain "existential issues". If you've lost your wallet in the park and you update the world so that it's now lying on the table, you can explain it away as having teleported it, or a friendly spirit having moved it, or forgetfulness (the "urge to forget" is very strong after significant shifts) or whatever. So long as you don't think too deeply about it.

I believe there are beings not in this realm here that don't have a discomfort around discontinuity.

What beings could there be that aren't of this realm? Surely there's just... me. ;-)

However, at high levels of renunciation, "breaking" what sucks or what one no longer cares for is no longer a big deal.

Many of the dramatic stories people have of discontinuous change occur in times of desperation: imminent death, life gone truly wrong. Interestingly, people often report odd and flexible realities when a child: wishing they were staying at their grandparents' and waking up there; needing to go to the toilet and 'blink-teleporting' to the bathroom; people and things suddenly changing, appearing, disappearing. Children have less of an investment in stability; correspondingly, their magick may come more easily. Ctrl-C, Ctrl-V (duplicating toys), Ctrl-Z (undoing events), etc.

The friend dying.

This links back to our other conversation about observations and so on. So for the purposes of this, I propose that observations are always consistent with previous observations, facts accumulate and the world becomes increasingly stable; the world always "makes sense". If you make discontinuous change ("my friend is still alive") then from that moment on your observations will be consistent with that updated fact. There will be no evidence other than your memory that it was ever different to this, since any "looking for evidence" would of course be an "observation" subsequent to the change. Now matter how it plays out, each observation will be plausible, and narrow the possibilities of the next observation:

- You are drinking in the bar. The friend shows up. He never had an accident and there's no evidence of an accident, and nobody remembers the accident or your previous conversations about one, or
- You are drinking in the bar. The friend shows up. He had been fucking with everyone with a Facebook post and it just got out of hand, or
- You are drinking in the bar. You have a conversation with the barman and talk about the friend's death, the barman says "yeah I heard". The friend shows up. Turns out his brother had a crash and the reports got confused, or...

Depending on what you do and how it plays out, you are getting what you want, but the "story" that goes with it may vary according to your demands. I am the formless realm. ;-)

Yeah, there are lots of interesting stories about distant places and what you might term a lower "consensus hurdle" to change, although I'm inclined to say that it isn't a real barrier so much as a barrier that ends up being formed within you. For example, many who go on meditation retreats report that after a while their dreams seem to be more solid and real than their waking time. The "rigidity" of their waking life seems to dissolve somewhat. The traditional view has been that consensus is enforced by contribution, but don't think that's necessarily so. Hallucinations are just more experiences and are equally valid. They aren't "wrong". Right? :-)

[Facts accumulate] They seem to, but they don't. All of one's expectations is one single expectation. Nothing accumulates.

For sure it's just a way of describing the process. There is indeed one single fact and it shifts (although not in time). When I was talking of a "world-pattern" previously, it is to this "one single fact" that I was referring. You are calling this "expectation" but that implies an anticipation, which I dislike. It is better to say something like "fact" - but remembering that "fact" also means how things work, the formatting or framework, not just specific locations and properties of "things" and such.

So knowledge cannot really accumulate.

The above should clear this up - accumulation would be the "apparent process" however the truth is something more like a shifting state.

The problem is, depending on how the story goes, you may feel like you don't deserve any credit for doing magick. ;)

Haha! Well, it may actually be the default that you don't retain the memory of the change. If the "one single fact" moves and doesn't leave you with any personal trace of the prior state, then your friend never died and you never brought him back. (Confusing histories!)

Additional: Just in passing, on the consensus thing, I was reminded of this story:

[QUOTE]

Consensus Reality

Aboard an oceanographic ship in the Persian Gulf
While I was stationed on a ship in the Persian Gulf during the war, I had the experience of being "out-voted" about the correct syntax of a computer command which I knew functioned perfectly well just the day before. A group of less well-informed technicians wandered by, and shared their consensus opinion that I could not possibly get the output I expected using that computer command. Lo and behold, they were right; from that point on, I never could get that syntax to work again. I have come to believe that reality is based on consensus. Proximity is probably relevant, and degree of belief/influence may vary for participants. I suspect that our long isolation as a group may have played a part in that event.
-- Yedeth, Your Stories Page 23, [\[Realityshifters.com\]](#)

[END OF QUOTE]

All you have to do, is wait, and new things show up. But that's not necessarily true.

This is exactly true, in experience! The next-step of the world always "makes sense" in terms of the previous observations. However, it is not predictable. Mainly because it is the world of reality (the entirety of all subtleties) that imply the next step. You cannot anticipate this or model it, because those things are in it.

All experience is directional. You can't stop directing it.

I dislike the use of "directional" because it implies a destination. I dislike the use of "directing" because it implies an act. However, the meaning is understood.

Simplicity is not a virtue in and of itself. I oppose gratuitous complexity.

We are agreed.

So a physicalist metaphor does what now?

All metaphors are essentially physicalist, in a way.

The world changes constantly in boring, uninteresting ways.

Maybe your world does; my world is far more fascinating. ;-)

I use the language of personal responsibility.

But who is this "person" and what exactly are they "responsible" for?

We can draw metaphors from family relations, or taste, and those aren't physicalist.

Actually, my real point was that all metaphors will be object-based within a context of location (space) and transformation (time). We are bound to imagine "parallel mini-worlds of surface" while considering ourselves to be probing something deeper or behinds things (which we are not).

What is the location and transformation of $1+1=2$?

Think of it now. What do you experience?

For me, I have a parallel sort of blank space which is simultaneous with sensory experience, and in the area which would correspond to just outside the location of the left side of my jaw, there's a white blurry hand-written script (like this). If I attend to this, I see that just beyond it is a sort of grid, like this but in a triangular shape, with the sides being of lengths 1, 1, and 2. I do not deliberately construct any of this, it's just what appears. Note that this is not a representation of the sum in my mind, it is actually that sum in my mind as it is currently. (From experience, if I change these "objects" then the change persists or evolves from the new state.)

I experience a sense of equivalence, is perhaps the best way I can describe it.

Would you say that was a "feeling"? A sort of felt-sense of the situation from which any other shadow-sensory aspects arise? I think of them as all of a piece. The form may indeed change depending on context but the "essence" of it is the same. (For the particular example, mine is quite stable though.)

What do we mean by "abstract" anyway? Perhaps we can approach this by example.

The Vase

I have never seen a vase before. A vase is on the table. I move around the vase, seeing it from different angles. I pick up the vase, feel it. I then use the vase, filling it with water and putting flowers in it. While doing so, a friend tells me where she bought the vase with her mother. Later that day, we go to the shop and see lots of different vases. In the evening, I watch a TV show about how vases are made. So, what is "a vase"? It is the summation of all those different vase-related sensory experiences. It is no particular instance of those experiences; it is the overall pattern produced by the accumulation of those experiences [1] - including the auditory-visual language, "a vase". When I say to myself, "a vase", I have a felt-sense that comes-with some other sensory aspects which appear in awareness. So it's abstract in the sense of not being "about" a specific vase, but in terms of being an experience it is quite specific.

[1] Berkeley has a term for this which I can't find at the moment: maybe something like "collection" or "occasions". In any case, all the sensory experiences of something that lead to it being distinguished and hence to the formation of it as "a thing".

I like the term felt-sense. I hesitate to call it a feeling. Maybe intuition is a better term.

I shy away from "intuition" because it's vague in use whereas felt-sense nicely captures the idea of felt-meaning and direct-knowing. It can be used to indicate what exactly intuition is in terms of an experience. And as you say, "feeling" means other things.

If you take it to be a summation, then so long as you are missing something from your summation, you don't know what the vase is.

You never know all about "vase" (potentially speaking) because there is are always more vase-experiences to come. Although you do know "all that a vase is so far". What vase "is" to you is the summation-pattern, the observation-accumulation, of all your vase-experiences so far. In the example, after the visit to the shop I have a pretty good "abstract vase". I could certainly identify things as vases and so on. But then I watch the TV show about how vases are made, and my "abstract vase" has changed again, been further enriched.

When I encounter a vase, all of this is triggered into experience a as a felt-sense. What a vase "is" to me, is that felt-sense. How would you describe what a vase "is"?

[On intuition as a word] I like it because it's vague.

I meant "vague" in the sense of it has lots of different meanings to different people, whereas with felt-sense we mean something which, although it cannot be specified in language, does have a particular meaning and context. The content of it may be vague, but the phenomenon itself is not. Anyway, felt-sense is the best term I've encountered for capturing that "direct global knowing of all aspects" of something (the quoted phrase itself already goes off!).

Either there is no concept of a vase then, since the summation is never finished.

You're not gonna get all "Platonic" on me, are you? There is no "vase" separate from the accumulated observations that contribute to "vase".

You're also assuming all your experience with the vase is acceptable and is not a corruption/lie/misinformation.

But how to judge that? All vase-related experiences add to my "abstract vase" and all are genuinely vase-related. If I subsequently encounter a vase-related experience which negates a previous one, then my "abstract vase" is adjusted accordingly. "Vase" is an ongoing thing. Just like the world. From a subjective idealist point of view, the world is my accumulated observations of it. There is no truth other than this, "somewhere else". Observations include sensations, perceptions, thoughts - everything that arises in the space of awareness. This is vital. Because this is how we can make changes. We do so by creating additional observations which constitute the latest facts-of-the-world.

I'd describe it as ignorance without any basis in either experience or ultimate reality, an arbitrary mental fabrication.

It's basis is entirely in experience and mental fabrication (which is just more experience) and also it is a form of the ultimate reality.

We use a reality validation framework for this.

I'd make the point that we are not deliberately working out what constitutes "vase" and what does not. I'd don't do any deliberate checking and cross-checking. Simply by encountering "vase"-related experiences my "abstract vase" is triggered and modified. Such experiences include conversations about vases and so on. When I say "observations" I mean in the broadest sense: any experience that connects in some way to my "abstract vase" will revise it. Because there is no separation between vase-experiences and my abstract-vase. My "comprehension" of the experience involves the triggering of my abstract-vase.

Instead there is one expectation which has a certain conceptual "shape" to it. When you learn new info, you update your expectation. So expectation changes shape, so to speak, but it doesn't change in quantity. It changes in quality only.

This sounds very similar to what I am saying though, does it not? Perhaps I need to be clearer: by "observation accumulation" I mean that the arising of experiences inherently evolve knowledge. As in the vase example above.

[On "creating observations" and magick] This is bad for magick.

I disagree, but remember that by "observation" I am including all experiences. To say observations are non-factual is the same as saying all observations are factual, in the context that the observation takes place.

By creating new observations, I am pointing to things like: Waving a magic wand having decided that waving the magic wand means that the weather will change - i.e. that wand-waving is a fact of weather-changing. Or by imagining that it is raining I am observing the fact of future raining.

No story required. But this is getting into a language tangle that is not really required. The general sense is that every observation is information about the world, and that creating an observation with different information is to change the world.

All experience is a mental fabrication.

You need to remove the word "mental" from that because it's meaningless.

POST: Letting things be and changing what you want

The problem is essentially the same as the other OP's. If I'm intending, doesn't that directly imply dissatisfaction with the moment I'm in? How can I be dissatisfied if I'm completely accepting? The struggle.

Well, I don't see the problem and perhaps it's a misunderstanding of things in modern interpretation.

In meditation, you "let things be" in order to let the noise subside and, in the subsequent calm, realise how things actually are (that there is the sensory experience, and stories about that experience are fictional and malleable). Having had that realisation, you are free to operate in alignment with the actual nature of things. You can simply let the current pattern unfolds dynamically without interference, like waves bouncing off each other in an ever-evolving but self-consistent manner, or you can use your will and imagination to tweak it now and again, like briefly splashing your hand into the water. "Everything is fine as it is" is a comment about the perfection of the self-consistent pattern, which has no choice but to unfold logically and perfectly. If you assert changes into the world, the shifted pattern will also be self-consistent and perfect. The world-pattern always makes sense. But some patterns might be more fun than others...

Summary:

- "Letting things be" is an approach to settling and understanding.
- The world-pattern is always perfect, in the sense of being a coherent, self-consistent pattern.
- Some patterns are more fun than others.
- Changing the pattern is fine. The new one will be perfect too.

However, it's true that the more detached you are, the easier the world-pattern shifts, and the more likely your world falls into line with your desires without your deliberate intervention - desire and pattern close their gap.

Let's ponder!

What is a desire?

I'm going to suggest a desire is an indication of the gap between what you are experiencing and what you should be experiencing - the sense of tension is because you are and have been preventing a movement of the world-pattern by holding onto it, and have through manipulation and ignorance deviated from your genuine wants. We might say this situation arose due to ignorance and intentions made from that ignorance, but desire itself does not come from ignorance; it's just a symptom of a state, a pendulum that is being held away from its rest position. As I suggest in the last paragraph of my other comment: if you're totally detached, then your world-pattern shifts naturally towards alignment. Once you are near, intervention isn't required so much. However, the fact is that we've all accumulated pushed patterns. Letting this "karma" unravel itself by itself takes time, just as any disturbance takes time to settle. And during that settling process, you might endure much unpleasantness. Unless you are able to absolutely and complete detach, in which case you might get something more akin to a "dream restart". But for as long as you are attached to the habit of continuity and plausibility, this won't happen. Intending with detachment is a way of quickly switching to the target pattern. The combination of detachment - implicitly in a direction, justifying your "allowing" - and actual specification of a target - which you have already decided to permit - lets you jump more directly to the wanted world-pattern. Not sure that was clear at all, sorry. The short version: desire is a sign that your world-pattern has been pushed into a now-inappropriate state; intending with detachment is a quick way to resolve that because it temporarily suspends some habits.

EDIT: If you were completely detached and allowing, then having a desire would be intending, and the world-pattern would stay in sync. Because desire = pattern in consciousness and intention = pattern in consciousness; the two should match; detaching and allowing is the process by which desires / intentions are integrated into the world-pattern; a desire is like a self-triggering intention.

Let me add: Perfection refers to complete self-consistency. It does not mean everything is in some final, all-things-complete, stable state. That never happens, for as long as there is any pattern at all. The world-pattern is always perfect because it always "makes sense", but it is always evolving. Desire is an indication you have been obstructing that natural momentum in some way. It will always resolve itself eventually, the question is how: by overwhelming your resistance, by you partially detaching and letting it flow more easily, by you intending towards it (accelerated jump), by you detaching absolutely, or by you intending directly to a balanced state (discontinuous jump).

I'll be frank and say that I am fearful of discontinuities.

That's reasonable. There's the feeling that if you let this happen, anything could happen - which is about right. At least at the moment you have, at the very least, the illusion that people remain the same people, and so on. A big shift means that this might not be true "anymore".

So would you say that having desires at all is a sign that one is ignorant, at least to a small degree?

I'd still say that it is a sign that you have acted based on ignorance in the past. We all do this: we all lug our bodies around by effort, for example, accumulating tension, when we are not meant to "manually control" our bodies at all. You might say that your aching body is because you have used it in ignorance. Extend this to the entirety of your world.

I've lately been experimenting with the idea that we, consciousness, could be thought of as knowledge itself.

Well, I'd say what you are is "that which is". It's not a knowledge, it's being. Knowledge implies a knower and a known, whereas you are the knower and that which knowledge is made from. So we are not just knowledge itself, we are what everything is. If by "knowledge" you just mean "all the facts of the world", then you are definitely all knowledge and all knowledge is you, but you are also so much more - unbounded. Hmm. Yeah, I still think that it's just easier to view ourselves as being awareness and therefore everything that appears in awareness is also us. "We are recall" rather than "we are memories". Knowledge is not a thing.

"The only reality is mind and observations, but observations are not of things. To see the Universe as it really is, we must abandon our tendency to conceptualize observations as things."

-- The Mental Universe, Richard Conn Henry

An extra thought: Do we take these things too seriously? If experience is about adventuring then swooping about between possibilities, making mistakes and jumping out of them, is part of the fun perhaps. If we could know for certain that we would exist as a conscious perspective forever and could retain our identity and memories for as long as you wanted - until we chose to wipe them temporarily or permanently - how would that change your approach do you think?

Q: I'd have more patience. I'd stop trying to get things and enjoy the current perspective rather than seek new ones all the time. I already feel like I'm going to live forever, so knowing my memories and identity were mine to keep or dispose of would likely just make me less in a rush to make the most out of this life.
Edit: Do we take things too seriously? I'd say that's a loaded question. We take things just as seriously as we're meant to. No more no less.

Hmm. It's hard to balance something: Knowing you can "jump away" from unpleasant situations should they arise, frees you to experiment more and commit more. But at the same time, having this knowledge potentially lessens the emotional intensity of an experience. Probably it sorts itself out: We forget our power, but when in dire trouble we tend to seek out answers, and in the process rediscover that power. But that does mean that ignorance, acting from ignorance, desire and intention, rediscovery and realignment, god and then... not - all those are inevitable.

***AI:** Try watching a movie and constantly reminding yourself, "It's just a movie, these are just actors," or playing a game and reminding yourself, "These are just pixels on a screen I'm moving with my fingers."*
***That's the quickest path to having no fun at all.** You'll hear a lot of people say that they understand the nature of reality "on an intellectual level" but that they don't "feel it, viscerally". And they mourn this as though it's a failure on their part. Feeling it viscerally is something I have done and it was absolutely dreadful. Most horrendous thing I can think of having endured in my life. Totally against my palette. All of the things that I like were absent and all of the things I dislike were present. It was massive,*

looming, horrible, lonely darkness of metaphysical despair. Understanding, truly, the nature of reality, but -avoiding feeling it viscerally- is one of the very highest paths (although it's tarnished by those who see it as some kind of second-best failure). The only way to go "all the way" and feel it viscerally, to know it in your bones and through them, is to utterly change your palette. To totally rewrite the things that please and displease you. Only once you're in a place where concepts of happiness/sadness, pleasure/pain, loneliness/companionship, form/void mean absolutely nothing to you can you make that step without finding it absolutely soul-destroying.

Yes, you have to immerse yourself to have fun as "the actor" playing the character, but you can also take glee in the creativity of being "the director". You do have to shift your mindset to do that though.

Q: I've never bought into this idea that the solution to everyones problems is to just "live in the present". I have this life log where I track my thoughts and how they relate to time. I track predictions (future oriented thoughts), reflections (past oriented thoughts) and statements (thoughts about the present)
What I've found by tracking the distribution of these thoughts from different users is that despite claims to the contrary we spend most of our time thinking and living in the present. In fact only 10% of the average persons thoughts actually relate to the future. 80% of the average persons thoughts are related to the current moment. Furthermore, being more present is not the solution to everyone's problems. While it's true that some people may focus on the future too much there are just as many people who either focus on the past too much or focus on the present and ignore impending negativity on the horizon. While many may suggest that the overall goal is to be more present in life, ignoring the future can be extremely detrimental to one's well being. Our main problem in regards to future oriented thinking is worrying to much and being unable to turn our visions of the future into reality. But it is not necessarily bad to use our minds to affect the future. That is what makes us human, the capacity to turn our dreams into reality. To ignore this fact is naive. Some people destroy their lives by being too present and never dealing with planning out their future. Some people spend so much time thinking about the future they never learn to enjoy what they have in the present. Some people spend too much time lamenting a past they cannot change. The key is to find balance between these types of thinking.

I'm inclined to think that past, present and future thinking are all fine when done with intention. Being "present" really means "being present to experience", and that can mean thought as much as senses. After all, thoughts are essentially sensory experiences, just not the primary ones at that point.

Once you've set the intention it's there.

Yes, because the intending actually is the making-it-there. If you intend "owls" then that is the overlaying of the pattern called "owls" upon the world, which you subsequently encounter as your attention scans over time. You are basically saying "from now on: owls", and experience unfolds logically from this from that point onwards. (Including, amusingly, experiences "about the past". Which means you discover that there are now apparently "owls" in your past where there weren't before.)

The world-pattern itself isn't intelligent - only complex. However, it is entirely responsive to being reshaped by your intelligence.

POST: Externalizing the internal implies internalization of the external.

[POST]

So I had an idea that was causing some doubt in me that lead to a deeper idea about lucidity. In lot of my dreams I find myself having to take a piss and when I wake up I do indeed have to take a piss. This kind of bothered me because if my dream body was being controlled by physical body it seemed to imply a realness to the physical. But then I realized I made an error in judgment because I assumed that my spirit or consciousness was moving from the physical to the astral/dream and vice versa. The way I see it is that we are constantly existing in both of these realms simultaneously but its our shift in focus that makes us feel like we are existing in solely one or the other. Think of it this way, In my external experience I am typing a post on a laptop right now, but in my internal experience there is a gnome sitting on top of a mushroom. The computer is presented externally in this level of the dream while the gnome is presented internally in another. Going back to my piss these viewpoints get switched you see. The dream/astral level becomes externalized as a weird dream bathroom where my physical need to piss becomes part of the internal experience. picture a camera with recording lens on opposite sides and both of these images present themselves on two different screens that we watch at the same time. Lens 1 is looking at a red ball Lens 2 is looking at a blue ball, so we have a red ball shown on the left screen and a blue ball on the right. If we rotate the camera 180 degrees the blue ball will be on the left screen and the red ball on the right screen. Imagine the camera is us and the red ball is the physical world and the blue ball is the astral world. Being lucid is learning to watch both of these screens at the same time, where as conventional perception has us staring at one screen at a time. Think of lucidity even in the conventional sense of a materialist lucid dreamer. He recognizes he or she is in a lucid dream because they are aware of the existence of a body outside of that dream dimension. To be lucid in this world we need to be aware of our existence in that astral world that is going on simultaneously. To think of each of these worlds as separate is what creates non lucidity because you exist only in one space at a time rather then on multiple levels at once.

[END OF POST]

Hmm, good musings. Your "external" and "internal" experiences both arise in the same space, so it's simply a case of different patterns being triggered into sensory form with different intensities. Normally, the "waking" patterns are more intense (more strongly activated) and so dominate the senses, and the background felt-sense which contains the waking world. When we go to sleep and dream, we might call that flipping between the two by shifting attention, but what is it that shifts? Nothing: we are simply intensifying certain patterns at the expense of others. To be lucid is to realise that all possible patterns in "logical space" are always present right now in experience, like stars in the daytime sky which are hidden by the brightness of the sun (the most intense extended pattern). Our insight is that we discover we are able to choose which star to make into "our sun" at any given moment.

POST: Seems relevant and applicable.

I think that when we let go (stop micromanaging) actually a lot of life realigns. For instance, we may be slogging through the fakery of keeping a face, we decide to give up on that - and then things seem to shift so that it's not required anymore anyway. There's something about taking an approach implying the (apparent) requirement for that approach. And the only way out is to... cease taking that approach. Being nice is 50% a trial but being "whatever you are" is never a trail, but somehow removes the requirement to be deliberately nice. I am not a fan of up-to-date papers, let us say. And I often find that if I don't do something that I'm meant to do, it turns out not to have mattered anyway. (Although avoidance doesn't work in this way, I suppose because avoidance implies that one should be doing it and that there are repercussions.) If life is literally this imagination space, this immersive strand of thought, then of course it has no "depth" and is an ongoing response to our approach at this moment regardless of any supposed history. Trying to live an ordinary life would actually be contrary to how things are, in that case.

I really detest humans so much these days. There are about 100 or 1000 humans I like, but on the whole I detest them. I don't give a fuck. Let them help themselves, I suppose. That's my mood recently.

I’ve been through phases like that. For me anyway, the people I actually know were fine in my mind, but anyone who was “abstract” were pretty much lumped into my sense of things more generally at the time. (That’s how it was for me anyway.) It felt like I’d burned myself out with the effort of, I dunno, feeling responsible - and instead just letting go of that obligation, I swung the other way. It was the concept of people at large I was feeling obligated to, and that’s a helluva burden.

I will meanwhile save myself, because I sure as fuck know, nobody gives a fuck about me, except maybe my parents and wife, which is sad, but that's the truth.

I’m sure that’s not true. Well, in fact I know it’s not true. But it’s a case of who matters, right? Those people matter.

I mean, I hardly ever seen anyone give a fuck about anyone else, except one or two people.

Well, it does seem that there’s a lot of self-absorption around as we go about our day. Particularly at the moment, where society seems to be set up more like a “fight”. But, you have to be sure to separate out your “fictional idea beyond immediate perception”, right? Because it has a sneaky habit of filtering the information that arrives to us, further supporting our view. It’s like: never believe your senses, never believe your thoughts, never believe your beliefs. Or something.

So I said, fuck it. I give up. You win. I will be that way too. I need to save myself first, and so fuck you all. . . Being whoever I am is not that easy considering how much filtering and censoring I'd have done in the past.

The next step though is to give up... even that, right? Yeah, all the debris we accumulate can make things pretty difficult.

[Things turning out not to matter]]LOL, I find that's true most of the time. Maybe I can even say it's been true every time in the past. But I still have this nagging sense of... what if I need this paper?

Yeah, it’s the faith thing! But as our “mind-roominess” grows then that stuff just gets better and better, and the apparent world seems to shift to match and accommodate us. Quite often other people are the sign of this. When you have shifts in mood, they respond. When you feel more open, you are open to them and they are drawn to you. For instance, a few years ago I had a bout of depression, and came out of it. I knew I was coming out of it not because of how I was feeling though - it was that in cafes and out in the town, random people would come up to me and start chatting away, in a way that never happened before. They’d just start talking unprompted about relevant topics, without preamble. They were basically taking on the role of my own inner voice, which had gone quiet, externally. Aspects of me.

Because it's not normal for people to smile like that when they pass you by, since I am not doing anything to invite that.

It’ll happen more and more. The more you surrender and the more unbounded your mind feels, the more exposed and defenceless you will feel - but what you will have become open to is a feeling of, I dunno, “the love” or whatever. You’ll be in rooms full of strangers and everyone will be your friend.

[On avoidance.] See, it's not all clean like that. I don't get how anyone can ever be perfectly clean about any of their intentions unless you've been living a certain lifestyle for a long time.

For sure. Or rather, it’s not about the lifestyle so much as when you reach the stage where you surrender your own micromanagement and let it all start flowing? But it’s natural to be in a mixed state with overlapping and contrasting intentions contributing simultaneously.

I think the amount of historicity really depends on how you operate your mind. Maybe for you there is very little, but for me there is quite a bit still.

Natural development over time, I’d say. Eventually you “operate your mind” less and less, and it’s more like (as discussed in previous posts and our lucid dreaming pal) recalling states that already exist than creating by control. To shift from one 3D-immersive thought to another, you allow the previous one to dissolve as your attention moves to the replacement. That kind of thing.

[On wives and parents and worldviews and presents.]

It can be pretty difficult when we love people and yet they are frustrating, due to their unquestioning worldview. Especially when we see it causing them problems, or that we have to be involved in situations we disagree with conceptually, as a compromise. Although that being okay, or endurable, is a sign that there are things beyond just those ideas, that are more important maybe. I think parental love is meant to be idiotic and primitive - that’s how parents have been designed! :-) They can only show it their way, even it’s a little outdated. Me, I accept the sentiment that’s been “infused into” the objects, even as I absent-mindedly dismiss the object themselves. There’s no accounting for taste, eh! :-)

On the point that people only care about a version of us, the “you”, that they constructed in their minds, there’s no way out of that though, right? Their “version” of you is you to them, just as your “version” of you is you to you - and will be incorrect, because it too is an aspect. Your parental relationship sounds fairly usual! :-)

[On society being based on the “fight and struggle” metaphor.]

I absolutely agree there. I’m not sure when things shifted to being “an investment”, although the seeds were sewn in the 1980s/90s are part of the deregulation of the finance industry, allowing banks and corporations to include yet more things into a “world as market” frame. This had led to everyday people treating their financial dealings as if they were ruthless players; they ditch their empathy and adopt sociopathic tendencies for their actions in those areas. And it has become totally transparent behaviour to them. Even to the extent that they moan about the actions of investment banks and the fallout, while supporting governmental and personal behaviours which exactly correspond to, and are the reasons for, this situation. We need only look at the current attitude towards Greece and the moral crusade against it. Greece must be punished, as an example to everyone else, the people must pay. Even thought the details are far less clearcut, it could easily have been Spain or Italy, and they were probably duped somewhat. It is disturbing to look at the misery that will because when you compare the Greek debt to the cost of the bank bailouts (reasonable summary from 2013 here on the state of those), and you see how lacking in compassion we are.

[On people being drawn to us.]

When you are “communing with glory” then what is being drawn to you isn’t people. For that time, everything becomes more “you” and the separation with others dissolved somewhat. You are, um, hanging out with yourself! :-) So yes, our non-human aspects bring us together, because our non-human aspect is that we are just one thing. I love the idea of you being both a sweetie and a beast - that’s how it should be! Although strictly speaking, we aren’t anything at all until events trigger within us a response of a particular type. And then afterwards, we stop being that too. We might have ideas about ourselves which persist, but they are baseless really, right? You are that nonhuman happy-said-sunshine-thing.

[On surrender and exposure.]

Yeah, by “surrender” I mean to cease to obscure what you are. It means to surrender opposition to your true state; it’s not like giving up to other forces. Since there is only the force-that-is-you, to surrender simply means to become more accurate in your ways, and hence effortless. On “exposure”, perhaps that’s the wrong word. I was reaching for something like “unbounded” or that being the context of everything, without being any one thing. There’s “nothing to grab” as you said.

[Dissolving the historicity.]

The more you do so, the less of a fight things become, the more like an “open mind” you seem to be, as you referred to earlier. That’s what that whole Overwriting Yourself was all about of course - relaxing or ceasing to oppose, and then asserting that unencumbered state, taking on the shape of it. The ultimate in agility!

Do you have a, um, vision or clear concept of how you would like to live, the world as you would like it to be? Not defined in terms of a response or manipulation of this one (i.e. not defined as counter or negatively) but as a positive image (not emotionally, but in the sense of being “assertable”)?

You can undertake long-term commitments or vows, and then you no longer have a loose identity with regard to those commitments.

Fair point. I was pushing more for residual ideas about concepts of self, and concepts of the world, but those are intertwined with our commitments too.

Hmm, well if giving up your mask is "surrender" doesn't it just cheapen the word?

How so? It is to surrender the comfort of your ideas to that which cannot be expressed, only experienced, in fact not quite even that. Our real self might be invincible, but it is not certain, until we have given ourselves to it - which is an act of faith ("surrender" in that sense, abandonment of prior ideas and trusting). This doesn't mean "dropping the social mask" so much as letting the apparent boundary between identify and world to fall away, meaning complete exposure but also complete becoming.

The closest I found so far is something shown in Hunter x Hunter anime.

Got it bookmarked but haven't watched it yet. Just glancing at the wiki page to remind me:

There they meet a kung fu master named Wing, who trains them in utilizing Nen, a Qi-like life energy utilized by Hunters to manifest parapsychological abilities—also considered to be the final requirement to pass the Hunter Exam.

Yeah, I'm signing up for the Hunter Exam, definitely! :-) One could potentially create a persistent dream realm to try it out in. Since it already exists as a pattern, it wouldn't need to be "created" just traveled to.

Might it be better to talk in terms of not being "identified" rather than "disowning"? The final view would be one where owning or disowning becomes meaningly. It's easier to say that because we are everything, we are not any particular thing - and that this isn't about content.

For instance, if changing from this environment to another is simply a case of allowing this to fade and embracing another, it makes no more sense to say we own or identify an environment than it does to say the same of a thought. The world "is" a strand of thought, albeit a bright and stable and immersive one, etc.

I can disown the world because it's mine to disown. :) Me disowning it is proof that it's mine to do with as I please.

Might it be better to talk in terms of not being "identified" rather than "disowning"? The final view would be one where owning or disowning becomes meaningly. It's easier to say that because we are everything, we are not any particular thing - and that this isn't about content. For instance, if changing from this environment to another is simply a case of allowing this to fade and embracing another, it makes no more sense to say we own or identify an environment than it does to say the same of a thought. The world "is" a strand of thought, albeit a bright and stable and immersive one, etc.

Whatever we say about it will sound as a limitation.

How very true. But who can resist trying to capture it in language, even though it is inherently impossible? Not I, for "one"!

It's so hard to come to grips with this being the case, because the world can become so small and insignificant if you get what this means. It's not a vast place.

It "has no depth" as I phrase it. The mind is vast- infinite - in terms of possibilities, but it takes up no space and takes no time to not-do-so. Talking of "personal beings" being overwhelmed, though, makes it sound like a personal being is in something - but I'm guessing you mean something like, of all the possible experiences, the experience of being-this-person-in-this-world is but one, and as a proportion is therefore vanishingly small?

In reference to the infinite grid of all possible moments, each instant is infinitely small.

What I mean is, your ultimate being overwhelms the world. Not the other way around.

Yes, that's it. The world is an ongoing thought within you, you are not an ongoing process within a world.

Gotta go. Thanks for the quality chat - enjoyable as always.

POST: I'm beginning to question some things about oneirosophy.

I'd say this being God Almighty thing is just another "as if" hat you can put on. The true sense in which you are God is that you are consciousness, and the world is solidified imagination within that.

Meaning - The world has no depth, but it's not in the sense of having no complexity or mystery, right? It's just that it is not "made from" anything; it is not a place. It's true that it comes down to "nothingness", but only in the sense that there is no solid substrate or ultimate pattern; there is still meaning. Experiential content remains mysterious, because God Himself does not know what the next-moment will contain. If he did then that would already be that next-moment. The complexity and the simplicity are unbounded.

Oneirosophy (or nondualism/idealism) doesn't remove the mystery, it just means it is clearer what's going on, which is something along the lines of:

- We tend to assume that we are people in a world, in fact we are conscious perspectives having a being-a-person-in-a-world experience.
- We tend to assume intentions act locally (body movement, deliberate thoughts), in fact they act globally (the whole world shifts).
- We tend to assume the observed facts of the world are definite, in fact their relative contributions to experience can be adjusted.

So it's really about a removal of misconceptions. Following that, the experience you choose to have is your own. You can live the life you want in the version of the world you want. There really is no fixed content-based truth at all; there is only the fundamental truth that it's all arising in awareness.

The only problem might be, there's sort of nothing to say beyond that. If there's no "how it works" and all experience is relative, it means you can't even really argue about things anymore...

POST: My Experiences So Far

There are lots of lessons to learn here.

But is there anything to learn really, beyond the one main lesson?

Beyond realising that the content of experience is transitory and relatively true, and that only the nature of it as consciousness does not change and is fundamentally true - surely everything else you apparently discover is really just "more dream"?

Even that lesson is more dream. You're dreaming a dream of discovering the transitory content of experience and the nature of consciousness. And you're also dreaming anything else you learn or don't learn. Knowing your true nature and not knowing your true nature are both dreams you can dream.

Agreed. The lesson is really a command: "**cease and be!**"

POST: Everyday Inception

Consider this as strands of thought, perhaps? From that perspective:

- What you might call your experience of being-a-person-in-this-world is a very bright, persistent 3D-immersive strand of thought which fills up your perceptual space. Directing your attention to that thought, you directly feel your so-called body and so on.
- However, most people have got into the habit of starting a new strand of thought, a thought which is "about" their body. This may be because they rarely have their attention expanded into the main strand of thought; instead they are focused in one of the spatial gaps, making them vulnerable to getting lost in passing thoughts, and rendering their awareness of the main thought like a "peripheral vision" experience.

All strands of thought occur within the same aware space, kinda "parallel-simultaneous" with each other. There are no "levels" like inception, but there are relative "brightnesses" at any one time. Being fully present would mean that the brightness of the primary strand would be intense, and there would be no narrowing attentional profile deforming it.

Another dream-like thing that people get is deja-vu! ;-)

I have an extra thing to say, which I'll write up properly later maybe, about how we often make the mistake of trying to move our bodies by gripping onto and moving the body-sensations. However, this just generates tension (we are intending the experience of "gripping"); we should actually intend-imagine the target posture, or a fictional image which implies the movement for us, and allow the body-sensations to shift towards that goal effortlessly.

A feeling-movement seems quite a good term to me. Intention can be the movement (really: a thought of an end-state which experience then moves towards) or it can be an indirect assertion (an imaged object causes the movement), but I guess both of them are basically subtle asserts of fact. There is never any movement really; an intention repatterns or defines a sequence of moments, which your attentional focus then encounters.

If you've read the Missy Vineyard book, you might find the exercises in The Michael Chekhov Handbook worth a look (link points to PDF: see ch4, p32 I think). They are exercises for actors, but essentially (unwittingly) they leverage the realisation that your experience is imaginary. Because they are written for performance use, they are described in an accessible way and quite a few people seem to find them enjoyable.

Wow, this is Jedi training! Thanks for this resource!

My father has it... I have it... my sister has it... you have that power, too.

The tension you speak of. Perhaps one could think of it as the common art of 'walking' applied to all 'movement'?

Most of us seem to walk effortlessly, in that we do not appear to consciously consider each individual step or twist of the ankle.

So we do not really think of 'walking' as a series of literal steps that we have to take. The 'walking' is just what it is feels like to be aware of the imagined target coming into actual being here and now.

Which is what Douglas Harding points toward with his experiment of spinning the world, or driving the world. And here's a related video/audio pointer with Richard Lang.

Yes, this is a similar angle to Missy Vineyard and Michael Chekhov (Alexander Technique variant and acting imagery, respectively). It's a changing of context leading to a change in how you intend. Douglas Harding is pointing out that same thing as "being the space in which experience arises", although he never quite says it straight I think.

I think most people, even though they walk effortlessly in the sense of not individually directing their legs, do somewhat "re-intend" their body position continually, which is equivalent to sending a "stay still!" order at the same time you are directing a movement. When you release that pattern, it's like gliding.

Q: Precisely. One could think of one's whole self as a leg in that sense. But it seems like it does require quite a bit of trust in oneself, as well as an openness toward the unknown. I guess fearlessness is a term that incorporates both. Let us take for example an individual who is terribly afraid of dogs. They decide to move from point A to point B. Initially there may be gliding, but as soon as a dog-like shape enters their field of vision they may feel a strong desire to 're-intend' their position as a way to seek alternate routes. The alternate route being a way not around the dog per se, but around all the bodily sensations involved with acute stress. But if this same individual is always aware that dogs are 'out there', gliding at all may be very tough. Oh, I would also like to thank you for making me aware of this 'Alexander Technique'. I had never heard of it before. It seems like quite the useful tool!

Yes, **it's about a level of trust**. Trust that the spontaneous movement that arises is the appropriate one, even though it feels that it is an uncontrolled response. In truth, so long as attention is fully open (actually: no attentional control) then the total available information is being contributed to your response, and it will be maximally appropriate. Ironically, any effort to constrain attention or movement to control experience, will lead to a "less safe" route. However, it feels very exposing to pursue this at first - although it leads to a sense of ongoing pleasure once things settle out and more of the "background" shines through.

POST: Playing with Attributions & Points of View (Yer uh Wizard, Harry!)

[POST]

I was talking in the comments of another thread about playing with how you relate to perceptions. Here’s a little more about that. Look around you for a while. Really get a good sense of where you are and how you feel right now. Take a few minutes to do that.

... ..

Good? Alright. Now, try creating a division between two distinct types of experience you’re having: **“direct perceptions” and “attributions”**. Notice the difference between the visual keyboard you're perceiving and your concept of “what a keyboard is”. To help you get a grasp of the difference between the perception and the attribution, try changing your attribution. Think about your keyboard as the instrument that it is. Then think about it for the block of atoms/matter that it is. Then think about it as the visual stimulation of 2d colors in your eyes that it is. Then think about it as the geometrical object in space that it is. Then think about it as the extension of yourself that it is. Note these different “ways of thinking about” the perception, and how they differ from the perception itself. Notice how much easier is it to play with these "ways of thinking about" than it is to play with the direct perception itself.

Try doing this with more complex, nuanced things. Look at your neighbor not as, for example, “Jeff the guy”, but as the hairless and upright homo Sapien, as the geometric object in space, as the sack of meat and flesh, as the conscious being with experiences and perceptions, as the child that grew up into an adult, as the background character in your solipsistic world, etc.

Now, take note that one of these was your “default”, while the others required an active consideration on your part. If you’d just stumbled out of bed and saw your keyboard, or saw your neighbor, you’d be “subconsciously” using one of these default attributions. **In fact, nearly everything you interact with is conceptualized in merely one way of many possible ways, and your current defaults can be changed if you’d like to change them.** If “Jeff the guy” is annoying to you, “Jeff the kid who grew up into a confused and sad man” might be less annoying, or if your keyboard seems crude and mechanical, thinking of it as a physical object of color and shape may make it less abrasive.

Your “default” is not very different from the defaults of most people. Collectively, we share a lot of default ways of conceptualizing things. These are “cultures”. Cultures are collected, habitual, often subconscious ways of conceptualizing our perceptions. If you feel your default way of conceptualizing things is shitty or non-ideal, then you can break away from your cultural habits. Personally, I think my (our?) culture has a lot of shitty habits both minor and major. For example, minorly, I think our cultural attitude toward food is pretty lame, and that we could be handling food in a much better way. Majorly, I think each of us has a tremendous potential for power and influence over our own state of being, but our culture conceptualizes lots and lots of “external” things as having power of us, and by assuming they have that power, we grant them that power. **This is kind of like being Harry Potter, and the invitations to Hogwarts are arriving in the mail, but instead of bolting up the mailbox, Uncle Dursley has taught the whole family that envelopes will burn you if you touch them, and so nobody ever touches an envelope, and if they did, they probably would genuinely think they were being burned.**

Alternatively, you can try to be “culturally open”. In other words, question your habits and tendencies and play with your habits and tendencies. See if you can’t change your defaults. See if you can’t start to love something you used to hate, or see if you can’t find depth to appreciate in something you’d only understood superficially. You can also do these things in the opposite way (e.g. hate something you once loved) and while it’s less fun and less encouraging, knowing that you can do that and being able to do that is important if you prioritize flexibility.

Of all the things one can shift one’s default attributions toward/about, the one I’ve found to be the most interesting is the way one relates to other living things. You’re currently experiencing reality/yourself as a being within a world. This is probably not a very unusual mode of experience. We can imagine experiencing merely a volitional being, and we can imagine experiencing merely a non-volitional world, but between those extremes there seems to be a “bigger infinity” of potential experiences that involve both a volitional entity and a non-volitional world. Taking the POV of a being or entity appears to be a common perspective (at least from where I stand).

While “you” are not a human, which is to say your capacity is not constricted to only being a human, you can (and, I think, should) dwell on the fact that you are currently experiencing a human point of view (POV). You’re currently “humaning”. And your spectrum of experience is that of the particular human you’re experiencing “yourself as”. So, while I’m ≠/ Utthana, the current perspective I’m taking is Utthana’s perspective (although I do sometimes take others). And just so, other living things are unique in that they exist within our perspective as other perspectives themselves. For example, TGeorge exists within my POV, but he exists as a POV himself within my POV. This means that there’s “a way it’s like to be” TGeorge. You can meaningfully say, “This is what it’s like to be a cat,” whereas you can’t say, “this is what it’s like to be a chair”. We can imagine ourselves as experiencing ourselves from the POV of a cat or from the POV of TGeorge, in a way that we can’t imagine ourselves as experiencing ourselves from the POV of a chair (as conventionally understood – we can imagine something that looks like a chair which could have a POV). Being mindful of this, to me, is super useful and enjoyable. I like recognizing other POV's within my POV because my default is often to objectify people and the really inflate my own POV. I don't tend to see other beings as full and as nuanced as myself, but Utthana the human and TGeorge the human are both equal POV's that I could take. So I like taking this perspectives (sometimes, and not always), because it allows me to:

1) Empathize. All POV’s are POV’s that I could theoretically take. I’m the capacity to take perspectives, not a specific point of view myself. “That could be me,” is applicable to everyone I encounter. I like to play with my default conceptualization of other beings in such a way that I'm inclined to have empathy for them. I currently am interested in playing a role of someone who is relatively non-aggressive, non-competitive, helpful, and kind. To further my interest in playing that particular game, I make things easier for myself by changing the way I look at difficult people (some of the time).

2) Be aware of the glaring subjectivity of my own POV. By regularly acknowledging and appreciating other potential perspectives, you come to appreciate your own perspective in light of others. You become aware of all the possible perspectives you could take. I especially like dwelling on plants, because plants have a potential perspective and POV, but it’s radically different from that of animals and helps to demonstrate just how alien our perspectives can potentially be (which in turn highlights the potential weirdness and alienness of our current, default POV).

3) Change my attributions more easily. Seeing my default perspective as just one among many helps make it seem less “front and center”, less dominant, less immovable. For example, I currently look out my window and see trees, grass, etc. They look kind of dark and I conceptualize them in a slightly negative way. They don’t

seem as positive as grass and trees in brighter lighting. Understanding that my default perspective is just one of many possible perspectives, I can decide to see the dim lighting as beautiful and cinematic, I can decide to see the grass and trees as miraculous shapes that grew from the ground, I can decide to see them as distinct entities with experiences and perspectives, or I can even decide to (and this is a step further, altering perception instead of attribution) see something entirely else outside of my window, like the Eiffel Tower. Asserting a new attribution or perception may, at first, feel like it’s “only happening in your mind” or “imaginary”. Further weakening your sense of your default POV as privileged (as well as further contemplating subjective idealism in general) will make “imaginary” seem a lot less imaginary and “only happening in your mind” seem like an arbitrary description.

I recommend you experiment with different conceptual attributions for your perceptions. Don't think that your perceptions can only be conceptualized in one way. **You don't have to learn how to do magic and directly change the "physical" world around you in order to radically change your experience in ways that make you happier and help you do things you'd like to do.** You have tons and tons and tons of default, subconscious attributions to your perceptions and every single one of them can be played with. This whole thing is malleable. And even the "anchor" of your attributions and perceptions, your particular "POV as a being", is merely one potential POV and you can play with that as well. Start small, work your way up, and try not to be discouraged by any tendencies to dismiss things as "imaginary" or "all in your head".

[END OF POST]

A good read. Couple of quick ones for now:

And just so, other living things are unique in that they exist within our perspective as other perspectives themselves. For example, TGeorge exists within my POV, but he exists as a POV himself within my POV.

Because this phrasing implies a nesting problem, it's probably better to say that all possible POVs are "moments" that are simultaneously available, and you can "take on the shape of" any one of them. The TG that is apparently within your POV is made from "sensations and perceptions and meaning"; it is not actually a POV. A POV is an experience, it isn't something that can be contained within anything else.

“this is what it’s like to be a chair”.

I don't see why this wouldn't be possible. People on ketamine report experiences of just this sort (becoming a certain object), as do those following various shamanic practices. It can't be imagined when not being experienced, of course - i.e. while you are still experiencing "human-ing" with the baseline sensory-channel formatting that this involves - but then again you can't experience being joyful and simultaneously imagine being depressed either.

This [becoming chairs and tables] is a subtle and tricky point, though, and you're right to question it. I wasn't sure how to convey it in such a way that made it sufficiently clear.

I agree it's a tricky one to discuss, because the discussion itself is of course "formatted" as a shadow-sensory experience, so it gets very abstract very quickly - but I think it can be quite a fruitful path to explore. There's no one way to make it clear, I'd say.

I don't think it's possible to experience yourself as an inanimate object.

What is special about "animation"? You can become the void space you are "looking out from" right now, and that is definitely not animated as such. You can become the gaps between sensations. You can also become your hair.

[They] experience themselves as being something very chair-like, but it's a distinct thing from what we think of as a conventional chair.

That would be the exact point though, right? If you-as-consciousness become a chair - if you "take on the shape of" the experience of being-a-chair - then it would not correspond to what we, while human-ing, think of as "a chair". I think the subtle underlying important insight here is that the "aliveness" or "intelligence" or "experiencing" that we have belongs to consciousness, and not to the shape of the experience. "Senses" are an abstraction, you never experience them. "Being human" is a dead pattern, as dead as a chair. Lend your attention now to the room around you, allowing yourself to "feel" into it in all directions. You experience this room by becoming it, filtered or organised by certain patterns. Even if you remove visual imagery, auditory imagery, textural imagery from this experience, you still have an experience. Are you maybe thinking about "human-ing" as being your current baseline experience in some fundamental way, when really it is consciousness?

I think even the notion of a "POV" might be problematic here. Because I don't actually have a human POV as much (as you've just pointed out with your examples), what I actually experience is being-a-world but formatted in a certain way. And doesn't "perspective" have the same problem? What exactly does it mean to "have a perspective"? It's just another way of saying we're taking on the shape of a particular experience, surely?

Let's perhaps skip to the bit we probably would need to bash out between us: knowing. (We can always back-pedal later.) This is not fully formed, I'm just trying to feel out how we could approach this verbally:

I suggest:

- To "know" something, you simply have to be it. Knowing is being, and vice versa.

This is not the same as having a conceptualisation of being something, of "being aware you are that something", since that is actually a thought about what you are (and is always wrong). The difference between knowing and knowing-that.

- To "know that" you are something, is to become the thought-about the knowing.

I suggest that we often confusing becoming the thought about something ("knowing that") with becoming the something.

I think you may be onto something that 1 is possible, while I think 2 is not possible.

Yes. We might draw comparison with our own experience, living as a human person. Let's proceed from our everyday experience:

- We are always experiencing "being" a person. (This is not strictly true in fact, but for this brief moment let's go with it and we'll return to this later.)
- From time to time we experience knowing-that we are a human.
- The knowing-that takes the form of a thought, and that thought arises as basically a "shadow-sensory experience". In other words, formatted as human senses.

This leads us to:

- The manner in which a human knows-that it is a human, is in the form of a human-patterned experience.
- The manner in which a chair would know-that it is a chair, would have to be in the form of a chair-patterned experience.

So -

I definitely think that one can be a chair. In fact, I think that our ongoing experience is a case of becoming lots of different things, so this is not a stretch really. It's actually harder to argue that we experiencing being a human as such, rather than just occasionally thinking-that we are a human. I am not definite that one can know-that one is a chair, while being a chair. And perhaps that actually takes us somewhere interesting:

- In what sense is it true that I can simultaneously be a human while also knowing-that I am a human, anyway? Surely I am either being a human or being the thought-about being a human?

And if this is the case, then doesn't that lift the restriction on knowing-that you are a chair? Because it reminds us that knowing and knowing-that are on the same level. It is consciousness that takes on the shape of both experiences. Consciousness is surely free to take on the shape of "being a chair" and then "knowing that it is a chair", without restriction?

[Knowing, not knowing, know-that simultaneously:] it's more likely possible than not possible. As a general rule, imposing restrictions on consciousness is false.

Agreed.

The way I conceive of this is through the idea of "lines of thought". To recap briefly: if we go back to the idea of what we truly are being an "unbounded open awareness", then our current experience if being a person in this room is really just a very bright, 3D-immersive, spatial thought which is filling up that openness. But it is a thought nevertheless. Then, there is no reason why, just as we might visualise a sphere floating in this perceptual space, we cannot at the same time hold a "parallel-simultaneous" experience in that same openness. We can look at a mountain range and simultaneously have a thought about mountains. In fact, we can be walking along a street in San Francisco while parallel-simultaneously paragliding in France. It's a matter of the relative intensity of the experiential patterns, rather than actually "being in a place". In a very real sense, we are having all possible experiences parallel-simultaneously right now - it's just that one or more of those "present-potential moments" are brighter and therefore more dominant than the others. (Usual metaphor: the sun in the daytime sky obscures the stars that are always there.)

So, in this discussion we're increasingly moving towards, again, consciousness as primary and any experiences - including reflections upon experience (which are also experiences) - being always available and current. Our apparent "human-ing" is therefore not at all restrictive inherently - except that for as long as it remains "bright" we will not be chairs nor be able to think from the position of being a chair. And if we become chairs completely we will not be able to think about being so in a human way. The question then perhaps becomes more about the ability to associatively link from one experience to another, rather than about the ability to have an experience. I can be a chair and then be TG, but whilst TG I might have no associative path to recall the memory of being the chair.

Time stops being of much use here.

Indeed, really we mean the experience of change or relative change (although that has problems too). I treat time, like space, as "arising with" a particular strand of experiencing. I use "parallel-simultaneous" to try and convey that things don't necessarily share the same experiential space, although they all appear within "open awareness".

And learning to play with relative brightnesses is what I'm particularly interested in.

For me, that's exactly what all this is about. The apparent manipulation of reality is all about what I would call "triggering patterns into brightness". When you move from this room to the room next door, you aren't going anywhere. Rather, the 3D-immersive image of one room - the thought of one room - is shape-shifting into the image of the other.

Are you REALLY the chair or TG? Or are you just experiencing yourself as if you were the chair or TG?

Yes, that's the question. That's why I keep going back to this "taking on the shape of an experience" wording. You are not inherently anything in particular, you are "that which takes on the shape of" things. For convenience, it's handy to use the phrase "I am TG" while that is the experience, but all experiences operate on an "as if" basis.

This is where the notion of imagining-that comes in. Right now you are imagining-that you are a person in a world. You are also imagining-that a whole set of facts-of-the-world are true, and the brightening of those patterns as a superposition leads to the selection of the moment you are experiencing now (as a metaphorical description anyway).

I found this to be a really productive and interesting convo.

Me also. It's always clarifying, especially if we're coming at it from slightly different starting points. I guess it's inevitable that eventually we'll all converge on at least a recognition of the common underlying aspects to each of our approaches. As to the other subs, my project is basically split three ways: developing metaphysical models (here), collecting spontaneous shifts ("glitches"), exploring practical reformatting ("jumping"). The strands have to be kept a little bit separate though, because mixing the platforms mangles your experiences (a point which follows naturally from our discussion).

POST: It seems like y'all are en route to mastering the siddhis, but...

[POST]

Hi there. I'm going out on a limb here and assuming that most of you (the prominent posters, at least) are familiar with the tenets of Buddhism--it seems that "oneirosophy" is (inherently) a melding of Eastern/Western philosophies. I have no doubt that there are some of you in this subreddit who are currently mastering/have mastered the siddhis (psychic powers that arise as a result of lucidity). My honest concern is, is not oneirosophy itself ultimately just another distraction, like everything else? I've spent many hours reading through a bunch of posts and they're all quite stimulating, intellectually and spiritually, etc. However, there is a LOT of ego here. Like, a lot. A lot of pride and condescension, as well... even if it's not intentional. While oneirosophy resonates with me (admittedly!), sometimes I can see why the Buddha intimated that it's more difficult for gods (as opposed to humans) to achieve release.

[END OF POST]

Well, I'm inclined to say: why not both? ;-)

I know what you're getting at, but provided you recognise experiences for what they are (peak and mundane it's all the same), then you are fully free to enjoy them, since you realise you aren't them fundamentally. That even includes having fun by being a bit of a dick in an argument now and again. Perhaps it's not what you mean, but surely pursuits of power are only "distractions" if you think you are separate from the world and that one part will overcome the other? In exactly the same way as "seeking" is a distraction. So long as you don't mix up the narrative with some sort of "development" - you have understood that although you may change, you never progress - it's okay I reckon.

Hey, thank you. :) Good words, here. And this actually does clarify some things!

No worries. An interesting question to ask ourselves: once you've realised the nature of things - and know that there's nothing to it, that it's boring - what then? You just gonna sit about for all eternity?

Everything stays the same.

That's why so many enlightened folk of tradition still drink, smoke, are rude and impatient, all that (apparently). By default, you are still having a being-a-person-in-a-world experience. Just because the world turns out to be dreamlike in the sense of having nothing behind it, doesn't suddenly make you a super-lovely guy - unless you arbitrarily decide to be so. And that's what you do have, more options (or rather the rediscovery of the options you always had) - i.e. the recognition of the possibility of changing your "private view" as you please.

A1: Late to the game, but I'll comment anyway...

That's why so many enlightened folk of tradition still drink, smoke, are rude and impatient, all that (apparently).

There may be a distinction between being "enlightened" and being "developed". I can imagine a person who's been able to see through to the "reality" of the world yet still has personal issues to resolve or a better perspective to develop.

Perhaps people often equate the two - enlightenment and personal "beatification" - but they might be mutually exclusive.

I agree. People tend to have an idea of what "enlightenment" is, and that it'll equate to some automatic Gandiesque outlook. But it is, at base, simply the recognition of the nature of experience: that it is consciousness "taking on the shape of" content, and the world is not in fact a "spatially-extended place unfolding in time". So, your behaviour might change because it comes with the direct recognition that "everything is consciousness" and everything is an aspect of yourself - but "yourself" isn't the personal self,

and the nature of reality is in truth amoral, so it doesn't pan out quite like folk might assume. If you suddenly realised that what you really were was "a big open space in which experiences appeared", then all your preconceived notions about what is important get recontextualised. It's this shift in context, and its implications, that others tend not to get.

POST: True "timeless" nature of dreams?

So, the "global summary" of the dream, a representation of (but also actually being) its entirety - encapsulated in a felt-sense of its overallness?

I think that's about it. If I could hold on to what that dream "structure" was, it was all the experiencing of the dream but wrapped up into into a 4D structure of sorts. Hard to convey since hen we think of "structure" or "sculpture", we immediately think of something static/unchanging. But the structure had all the aspects we know as change, just wrapped up in itself. "Felt-sense" is about right. I could sort of see it in mind's eye - but that was a visual interpretation arising from the feeling of recognition of what this thing was. (That is if I'm not mistaken about the whole thing.)

My suggestion (via The Patterning of Experience and related) would then be that your current world is also a felt-sense that you are interpreting by unfolding aspects of it into sensory experience - arising as a 3D-immersive strand of thought in your "perceptual space".

Yes. To me, it hints at the possibility that our current experience is our physical brain interpreting or translating that felt-sense into something temporal and sequential - for whatever reason. Of course, the "brain", in this case, would also be a part of this experience...so a recursively created experience by a created experience.

I say - No recursion. Just forget brains. And interpretation, as such. A moment's pause, a relaxation of attention, and it's obvious - right now - that what you truly are is basically an "open aware space", and all sensory experience arises within that. "Sensory experience" includes thoughts, which are basically "shadow-sensory"; they are just not so bright, stable and 3D-immersive. I might then suggest that there is no 'outside' to this space, and that all possible experiential patterns pre-exist and are dissolved within it, varying only in their levels of contribution. All you need to do is, while looking at this screen, direct your attention to the "place you are looking out from", and note what you find there. (The alternative is to take a leap of faith and "just decide" to become the background space to your current experience.)

POST: Wu-Wei, doing nothing

It means doing away with the compulsion to "better ones situation" or to be mired in ignorance of one's perfect position always.

I'd also add that it is a much more practical thing. It's that thing of your body "moving by itself", effortlessly. It's the flowing detachment which means your body and mind respond appropriately to the situation. This often gets overlooked by authors, because if you've never heard of the experience and never had it, you would never know that this is what is being indicated. Just as with (say) the parables in the Bible, where, because they don't know what is being pointed at, they interpret it in all sorts of mundane ways relating to making choices and moral views (not to mention an "entity god" who is separate and does things independently). So, one might do away with the compulsion to better ones situation, but that's in the sense of ceasing trying to directly manipulate it with action, rather than with intention and letting the action flow. Anything you do is "correct" in the sense of it arising from the current state in response to circumstances, but only if you truly allow action to rise spontaneously, rather than holding on to parts of your current state. Wu-Wei, then, is perhaps better described as "not interfering" and "opening to spontaneity" and "effortless action" in a direct experiential sense. However, as with all these things, it does then get used as a metaphor in other parts of life.

All good points. I may have phrased it in a confusing manner. I like your quoted explanations. It is indeed the sort of thing that is difficult to understand in the context of how "regular" people "regularly" understand the world. Non-interference is the easiest for me to directly understand. When we interfere it's because we believe in separation. If you realize the experience as a shared dream of one entity, then you have no reason to interfere, because you are it. Then you have every reason to play.

Perhaps the core of this is: people confuse intention with experiencing bodily action. In fact, an intention can be attached to any act or experience (and an act is really an experience: the experience of an action), whether it is "regularly" logically related to it or not, and results will follow correspondingly. Without understanding the rule that "experiences are local, intentions are global", it's inevitably that things like wu-wei and indeed everyday motion and experience, will be misinterpreted.

So then what do you think classifies as interfering? If I had to try to piece it together I'd say nothing can be truly said to be an interference if one completely accepts one's direction. Note how I didn't say be sure of one's direction; you can be uncertain but accepting, of course. This I've found is the best way to live. Sure you could have things turn out a very certain way, but that's overall less enjoyable then the spontaneity of doing what you want in an unpredictable way.

Any ongoing intention which countermands our spontaneous movements - of body, mind, attention or world - which arise in the moment. Something like that?

However, practically speaking, we would of course occasionally "redirect" things by intention. But it should be in the manner of course correction, rather than slowing things down because we don't trust our spontaneous responses and so holding onto every moment. In general: you should be sitting back and enjoying the unfolding experience, rather than constantly hitting the brakes.

A further thought: also, pushing ahead or "forcing" is also interference, and probably the most common type. You are walking along the street to catch your bus, and you force the walking to go faster than it is spontaneously occurring. Lots of examples of this, large and small, all stemming from a lack of trust that what is arising naturally is appropriate. (So you get to the bus stop, and it's delayed for 10 minutes. If you'd kept your relaxed pace, you would have arrived at the perfect time - and so on.)

[This is very meandering...]

I'm sat on a chair. I'm thinking about how crappy work has been. I've been pretty depressed about it. Wait! I intend:

- "A great business opportunity that's ideal for me."

I potter about. Feel hungry. Fridge is empty of healthy food. Maybe I'll go to the grocery store to buy apples. I pause. My body gets up, and does this. I find myself enjoying the sights and sounds of the city as I walk a couple of blocks along. I find myself interacting wittily with the shopkeeper, but before I make a purchase, I bump into an old friend I had been thinking about earlier, and we pop into the bar round the corner for a pint of cider ("liquid apples, almost the same!"). We have a fun time. During our conversation, he mentions that his ex-girlfriend is setting up her own design business. Knowing I'm into those things, but my work has dried up, he give me her number. We meet two days later for a coffee, our business ideas are totally aligned: why don't we set this up as a partnership?

= one intention + letting experience arise.

You can live without intending, but if you never intend, then experience will just continue along its present path. I will remain depressed, depressing things will continue to happen.

Intending = re-patterning, with that patterning subsequently arising in experience.

The main lesson is, though: there's no "fundamentally naturally good state", because that would be the notion of destiny. I don't agree with the notion of destiny, or of a path that is independently correct. If you don't like the current state you are in - perhaps because it has become very "splashy" and incoherent, you can use intention-imagination to bring it under control more efficiently. Things will resolve themselves eventually, but deliberate intending lets you "skip to the end". For instance, fixing the heart or abdomen as your centre provides a stable, reliable point as everything else shifts and evolves. (Although ideally you are spending daily time letting all of that left over movement unravel anyway, through a releasing period.) I'd call those areas the "global summary": by attending to but not focusing on - perhaps "including" is a better word - you get a situational awareness of an overall type. It doesn't guide you, it is just is the most efficient way to be directly aware of all available information. Which allows you to decide intelligently whether to amend it or not.

Short version - If you don't like your situation, intend the alternative. Having done so, then trust that the world has been re-patterned "4-dimensionally", and let things unfold. If you keep intending (micro-managing) then you don't get the benefit of the "autocomplete" nature of patterning - instead, you will only get exactly the step-by-steps you ask for, that you can intellectually design, and you won't benefit from any "magical" coincidences or discontinuities, etc.

But couldn't the state of allowing your intentions could be the fundamentally naturally good state?

Okay, this is a wording issue I suppose. I use "state" to refer to the current configuration of the world, all the activated patterns in their relative intensities. If you don't interfere, then all the experiences which arise spontaneously will do so in accordance with that configuration. If you intend, you shift the state, and subsequence will arise in alignment with that configuration. So in this sense, one state is as good as another in the sense that there is no configuration that is "the configuration". Just like there is no "best" pattern of ripples in a pool of water. Maybe if we use "approach to living" rather than state to mean what you are saying, then we can say that non-interference would be the ideal approach - with occasional course-corrections (amendments of state/configuration) if so desired.

My heart is sending out good feelings when I align to my highest intention. What is my highest intention? To be free.

Can we change this to, rather than "sending out good feelings", some thing like "is a good feeling" when you align to your highest intention? And then I'd suggest: what's happening is that when you cease to oppose the spontaneous arising of experiences, you feel a clarity and maybe even something like "love"?

Note, you can have this feeling regardless of whether the current state is traditionally a pleasant one or not. The feeling comes from not being conflicted or fragmented, not from a situation being good. People feel most at peace shortly before their horrific violent car-crash deaths...

That's why I say that there is no such thing as a fundamentally good state, but there might be a good approach.

Would that description fit in with what you're getting at?

...

Try this experiment: Lie down on the floor and let go completely. Of your body, mind, but most importantly your attention. "Play dead" and allow your attention to roam where it wants. Habitually, we try to use attention to manipulate our experience and "do things" but this actually obstructs change. So having let go, "just decide" - i.e. intend without doing anything - that your body is going to get up. Do nothing, and let your body move by itself when it wants.

Note: By "do nothing" you must not actively do nothing, because what you will tend to do in that case is re-assert your current position. In other words, you will intend being-where-you-are are as the interpretation of "do nothing". And as a result you will suppress any movement. Really I mean, "do not interfere with any movements that arise".

I'm sure I could do it but just a bit hesitant to try. Why might this be the case?

You can definitely do it; it's not different to what you're doing anyway, you are just ceasing to intend the opposing motion. Stopping "staying still" all the time by constantly asserting your current position. It's a bit frightening because you are letting go of what you perceive to be direct control (even though such control actually works against your intentions unfolding). It amounts to "surrendering to god" and trusting that spontaneous movements "from nowhere" are the right ones, even though you cannot intellectually access any reason for them. Particularly in Western societies, there is an underlying assumption that our raw spontaneous aspect is evil and untrustworthy and needs to be suppressed. You perhaps have unexplored notions of how bodies and minds work, of there being an eternal battle between reason and magic, impulses and order, good and evil, and so on. Really, it is fear of The Unknown. But you have to get used to this at some point, because all of experience is "unknown" until it appears within your perception.

Short version - Try it and see. Once you decide to truly surrender and give up, and things settle out, it'll likely be one of the best experiences of your life.

Thank you for doing what you do. :)

Haha, thanks.

Oh, I had an extra thought too: when you release your attention, this obviously means you are no longer avoiding any body-space areas which might contain "stuck thoughts and incomplete movements", as I call them. In other words, things may move and shift and that includes uncomfortable feelings that have been left "orphaned". If such things arise, just let them become prominent, peak, and they will "complete themselves" and fade. Trust this. Sometimes people clamp back down again when these things appear - if you remain in open attention, it'll pass, and will be like a wave in the ocean, rather than in a glass. The relief and calm once these are cleared is very pleasant. Note: as is the theme here, you don't need to do anything about them, they'll resolve themselves.

TriumphantGeorge Compendium - Part 19

POST: The idea of imaginal metabolism.

I hadn't thought of using "digestion" as a metaphor before - really interesting. If everyday life (and specifically the body) is basically "imagination solidified", then any imaginative act performed with intention can potentially have an effect. Although we habitually view our sensory experience and our thoughts as existing in different realms, in fact they differ only in intensity, and share the same space - which means that the connection is a matter of degree rather than possibilit-ee.

...

Yes. So, when in other comments I say that "all patterns are always present and active to some extent", it's in the same sense as that. It's not that the "embodied imagination" is a special level in terms of it being a primary structure, say. Rather, flipping it around, it's that this particular set of patterns are currently very bright, and therefore dominating our experience. Any collection of patterns could become the "embodied imagination" if they were intensified appropriately. So, this gives us a couple of obvious ways to soften things up a bit, right?

- We can do it indirectly, via an imagination object imbued with particular meaning. For instance, vividly feel-imagine a sprinkler located in your stomach area which spins round, whose water has the property of dissolving the solidity of the world, and leave it running. Or --
- We can do it directly, by 3D-imagining/asserting over our current experience (i.e. in the same space as our present perception), an open empty unstructured space with the property of "dreamlike flexibility", for a prolonged period perhaps, such that this default of transparent malleability becomes more prominent.

...

Right, so they're the same approach fundamentally, but the implications are different.

I've not got the phrasing down for this, but let's have a go...

In both cases, you are creating something from nowhere - the sprinkler, or the "space of flexibility" - and assigning a meaning to that act, a result that it implies. It's just that the second one seems more abstract because it doesn't have an obvious "shape", and the second one also involves the creation of something which has the property of the result. However, that property is you specifying the change, it is not you making the change. In both cases, the result is indirect. It is the changing of the fact that is implied, that brings about the result. The imagery itself cannot cause anything - one piece of transparent imagery cannot bounce off another piece of transparent imagery. I suggest that a fact itself is a dimensionless part of an extended pattern and has no sensory aspect itself, so if you are at all aware that you are changing a fact, then you are always "creating something which implies the change of fact" (an act), not directly updating the fact. When you go to a bar you've never been to before and open the door, you are not aware of updating the fact of the barroom; but the very first intentional step you took towards going there, implied the fact of its existence, and every other intentional act you did shifted the world and implied a particular sort of barroom - right up until you actually observed it. At the point of observation, it becomes "fixed" in the scene that an experienced scene is much "brighter" and becomes a high-contributing pattern when it comes to subsequent experiences.

And in reverse order -

I think it's also possible to make one's style of experiencing into something where experiences do not become overly fixed no matter how bright they might seem.

Yes indeed. You might view it as there being a contributing pattern/fact which corresponds to the statement: "The world is a stable place and the implications of a sensory experience constitutes a set of facts which persists once the sensory experience end". These more abstract patterns are of exactly the same nature as any other pattern: they always exist but their contribution to ongoing experience can be increased or attenuated. Which leads to some interesting questions about how far one really wants to go with messing with accumulated structures - there's flexibility available, sure, but there's decoherence if you push it too far.

Why not directly? So you're saying facts are only and ever implied? Are facts always tacit? I think this might be important, but really I have trouble feeling what you're trying to get at here.

EDIT: Warning, this is not well described. I'll probably try this again after I come up with a better way to put it into words.

Let me try and grab a hold of this. There's a couple of approaches I can think of to describe it (bear with me since I'm formulating this as I go).

So, let's begin by taking an obvious fact:

- "Everyone always loves me." (heheh, why not!)

Now, try and summon that into sensory experience. What you'll likely come up with is an audio-visual-texture-emotion sensory aspect of that pattern which includes a felt-sense of it. But remember, that particular pattern is one without a temporal restriction - it is immediately "all time everywhere forever". You can't actually experience it from a 3D-immersive single moment viewpoint, much less in a contracted image. You can't grab it completely and hold it in your hand (so to speak). You hold part of the extended pattern in the senses. And that extended pattern is part of the undivided pattern of all-patterns.

So what I'm getting at here is, while any possible intention is of course is a shift of the entire pattern (or "all possibilities"), we obviously do not experience that because we are only ever aware of a slice of it. We operate in the blind. When I create my sprinkler, it is simply by hook onto a larger pattern which I cannot fit inside my current perspective. But since the sprinkler is connected to that, it becomes my proxy, and my manipulation or specification of that, becomes/is my manipulation or specification of the more abstract fact.

When I do this with my "softening of the space", I am doing the same thing, although it's more subtle. I am imagining, implicitly, a space and that the space is softer. I am not actually directly making my current space softer, the space I am imagining is just the partial aspect of the intention. You can see this in practice because when you do this, the form that gets triggered in experience "happens by itself" towards the imagination, like you have pulled on a piece of material. You notice the same thing when you use imagination to move your body. You can imagine a wind blowing your body forward, and your body will respond as if that were so. Or you can imagine your body in the forward position, and your body will shift state towards that position. We might call it "intentional leading" or something like that.

EDIT: When you try to heal yourself, how do you do it? You quickly realise that grasping onto the sensations and trying to change them doesn't work. Instead, you must "be the space" around and through the area, and then either use a metaphor to change it, or imagine the replacement sensation. But I'd suggest those are both the same thing: creating a desired sensation is still a metaphor for that target state and is not the target state itself, because: time and the inability to fully specify, you can only imply. Practically speaking, it's not that important, and I'm obviously struggling to convey it. But for as long as there are any patterns active, there will be a notion of change, and for as long as that is true, there will be a "leading" effect, I suggest.

Here I don't agree with your choice of the word "directly" in the context of the above-quoted paragraph.

The sense I'm using "directly" in that paragraph is in the experiential sense - that within the current sensory field (as you phrase it) you are experiencing performing a creative act relative to your desired outcome which you might naively interpret as being an interaction between just the sensory objects. So, taking the "naive view" as being one where we assume that what we experience in the sensory field is what is happening, then:

- In the sprinkler example, even in the naive view it's obvious that you are taking an indirect route - in the sense that you experience yourself creating an intermediate step. You've created an object with properties, such that it will bring about the change.

- In the updating-space example, though, in the naive view we might think that you are actually interacting with the space that you have been experiencing and modifying it. Hence the potential interpretation of updating it "directly".

In fact, the two approaches are identical, it's just that the "sensory aspect" - the visible part of the iceberg, if you will - of one corresponds more closely to what the experience of being completely in the target state will be like. The "naive view" person is not doing what they think they are doing in the "actual view".

In the "actual view":

- All experiences and changes are direct - because there is no other way for anything to be. All that exists is "The Absolute taking on the shape of The Relative". So any experience of change actually is that, being and changing. You can't get more direct than actually being something.

A sensory act is like shifting the tip of the iceberg, or pulling a rope in the dark. The sensory experience is just your sensory handle onto the larger pattern you are invoking. Some sensory handles happen to be of a form that is a more literal representation of the intended end-state, but that does not change their level of directness. The handle is always indirect (in the sense that it does not provide a naive experience of the change) but also totally direct (in the sense that it is a direct interaction with the facts-of-the-world). We can also think of these handles as "icons". Let's use an everyday example, where there's a folder on my computer desktop and I want to remove it.

- The "folder" looks like a folder. It has all sorts of folder-concept associations for me. My tendency will be to think of it in terms of an actual folder. In truth though, there is no genuine "folderness" underlying either the icon or real-life sensory folders, other than those associations. And therefore I can create my own association.

However, in our computer example:

- I can right-click on the little picture of a folder, and select "Delete" from the popup menu. This is like the sprinkler example, where the act is more of a more abstracted form. There is nothing about the letters D, E, L, E, T, E, that correspond to the everyday sensory experience of removal. This is revealing of the principle: "the meaning you give something is what supplies its causal power".
- Alternatively, I can drag the the folder to the trash. This is like the "updating space" example. The sensory aspect of the act matches my usual notions of how the act of deletion works: a folder getting put in a bin. But really I'm just being fooled. Just as in the last example, there is no literal correspondence between the sensory experience and the form of the update. In fact, the actual update has no form and is literally unthinkable; I can only think in terms of icons/handles. This reveals to us that our accumulated historical meanings are no more direct or real than the ones we arbitrarily assign.

The conclusion is along the lines that all sensory experiences are "handles/icons" for the larger pattern, undivided from it, involving direct interactions, but not complete experiences, because they are not completely unfolded. Our habitual perspective doesn't have enough "dimensions" to experience the whole thing unpacked simultaneously, into 3D-immersive space.

So hopefully this ties your comment and my comment together? Specifically:

- All updates are direct in the sense that there is no such thing as not being direct, because all there is, is Absolute-Relative. It is always directly experienced, but not in unpacked form. Facts and patterns are "dimensionless" in this sense. (Felt-sense, global summary to the rescue.)
- All updates are indirect in the sense that our sensory experience of the act is not an actually an experience of the overall pattern changing.

As you indicate, we are left with inseparability, full responsibility, and unbounded potential or capacity - whilst also having a situation in which "all creation is finished" and always available.

Ive noticed that if I believe I am trying to enact a change, then I will experience merely trying to make the change. The change itself doesnt necissarily manifest. Ill just be manifesting a struggle.

Yes, you have to generate the experience of literally updating the world - or doing something that you have decided means that you are doing so.

...

Ah, that was enjoyable. Okay, mostly agreed. Yes, I'd forgotten about Hoffman's icons (I was just looking for a more immediate example and, um, I was looking at a computer screen). But yes indeed. Where I differ a little is that I was more explicitly pointing to the icon as being "attached" or rather seamlessly part of the larger pattern. To "tug" on the desktop icon is to literally pull upon the extended pattern it is attached to.

And that's why I say things are unthinkable, in the sense that the computer screen cannot display the entirety of the of the computer, because not all of the computer is made from "colours" and a part cannot display the whole of which it is a part. In clearer language: we can indeed think about anything, by manipulating the sensory iceberg tips, but we cannot think of the entirety, because thinking is partial experiencing. Experiencing the whole would be... experiencing the whole. As far as the term "Absolute" goes, yeah, it's the hypothetical state that we might call "unshaped" experience, the raw state - not my favourite term for it, but we need something, and I tend to try different ones out. I think a word is required for this, because it's only in contrast to this concept that we can fully point to the nature of relative experience. Otherwise it's like describing waves without having the concept of water. Of course, experience has no medium as such, but its difficult to discuss its arbitrariness without some concept that "all patterns" exists somehow, even if totally neutralised.

On "dimensions" - just a metaphor to better imagine selection (or relative intensity) and apparent perspectives. Specifically, that you can't simultaneously imagine a 3D-experience and imagine a 4D-experience. This connects to the thinking-with-iceberg-tips earlier, really. As you say, representation - which is really partial sensory experiencing of extended patterns - cannot be complete, at least in terms of being unfolded into a spatial context. Meanwhile, elsewhere there's been discussion of those events where people experience reaching a catastrophic end - and then it didn't happen, but it seems the world has shifted somewhat. Interested to hear your own interpretation on that, jumping off from my response below:

Factual Updates and Collateral Shifts

If the world is a continuous and coherent pattern, a blanket of material with folds as facts, then you can't adjust one fact without tugging a little on the rest of the material, impacting the other folds. Although these "collateral shifts" would make sense in terms of the fundamental nature - the blanket - they wouldn't follow the logic of the world's apparent content - the folds. For instance, your car tumbles off the side of the road but - flash! - suddenly it didn't happen after all. Changing that fact inevitably results in a collateral shift of the world as a whole. But it takes the form of, say, an extra tin of fruit in your kitchen cupboard, a news reporter's hair being parted at the other way, and an acquaintance you've not seen in 10 years now never existed. Those changes are causally linked to, but not logically linked to, the event. Quite possibly you would never encounter these updated facts. However, the change in your felt-sense of things - that "global summary" sensation that you have - might mean that the world sort of "tastes" different subsequently. You intuitively know that you are no longer in the same place. There's a different "flavour" to your life after the accident somehow.

Riffing on this a bit...

So if there was just flash, and suddenly the accident didn't happen, could you recognize such an experience without the requirement of differently parted hair on a TV announcer? I think yes, you could. So it's not a hard requirement to have differently parted hair.

It's not a requirement - rather, it's an example of a possible side-effect arising because a change of one fact tends to lead to non-logical shifts in other facts, as they are of course part of the same overall pattern. So you survive the crash, get home, and notice (hey!) an extra tin of peaches. The cause is a shift of state, but in terms of everyday logic it seems nonsensical to the experiencer. Of course, this is a case where our experiencer produced an intentional shift of state (albeit unwittingly in terms of outcome, it was probably: "I want to live!"). If they'd just let themselves die, their experience would continue but probably in a more interesting way. So moving a hair doesn't change anything. The movement of the hair is already part of the current state, which is static and eternal. Only intention changes state. If the movement of the hair was not already patterned - it wasn't going to arise - then the intention to have it move represents a state change and will have (very minor) collateral effects, otherwise it will not.

What we might call spontaneous or "passing" experiences (in the manner of "passing thoughts") do not correspond to intentional changes of state; they are deterministic unfoldings from the current state. Only intentional redirection changes the state.

It's not like shifting can be studied objectively.

Well **nothing can be studied objectively**. The point I was making was, no particular collateral change is required but any change can happen by the logic of continuous, coherent patterned states.

I don't think we can talk of the state as something beyond intent, on its own.

We're not, though. The state is your current total intent so far. When we intend something, that's not something additional on top, it is the shifting of this state. So if we think of our current state as the set of all-patterns, each pattern at a different level of contribution, so there's a relative distribution of intensities:

- That state is our total intent. It is static and it completely defines our experience going forward.
- What we call "intending" is really "changing the relative distribution of intensities" such that our state corresponds to our intention.
- Because there is no separation between "intending" and "shifting of state" - it's like a blanket of material folding itself into a different shape, under its own volition: shape-shifter metaphor - then "intention" is "the state".

Our current intention is our present "shape" - just like our current physical position is the relative arrangement of our body parts. We change bodily position by rearranging the body, which we call "moving"; we change intention by changing state, which we call "intending".

...

Yes indeed, the body example was an everyday perspective comparison. Heh, perhaps we should introduce a special character (§) that corresponds to "but of course, the whole known universe was involved in this". "So I§ was walking down the street§, and I went into the shop§, and bought an apple§ which I ate§."

...

[COMMENT]

Q: It's not that the "embodied imagination" is a special level in terms of it being a primary structure, say. Rather, flipping it around, it's that this particular set of patterns are currently very bright, and therefore dominating our experience. Any collection of patterns could become the "embodied imagination" if they were intensified appropriately. I agree with you completely. However, in this I think we're slightly different from the book author because I think he feels this embodied imagination is completely special and unique and "on its own level" so to speak. It's not a philosophical book, so it's hard for me to put my finger on the author's metaphysics, but he does sound somewhat like us because he is saying that phenomena we think are physical are only quasi-physical. In other words, he's saying also that physicality is ultimately just a very impressive illusion, exactly like in a dream. However, he privileges embodied imagination and he even believes he's able to contact alien intelligence through the use of specially guided embodied imagination. So "alien" here doesn't necessarily mean "from other planets" but it only means different. So for example, if you felt yourself embodied as a bear with the mind and experience of a bear, then that would be you making a contact with the alien intelligence, as he would put it. And then this has some kind of purpose. Anyway, the way he explains things sounds very strange to me and it's not how I would explain things. However, he kept making references to the alchemical tradition and I found it interesting. I'll try to quote a piece of it:

The basic consistency of all substance was called prima materia, primal matter. Since alchemists considered matter as existing in a state of continuous creation, primal matter consisted of sparks of live creative forces around which visible matter coagulated. This is similar to the quasi-physical substance of creative imagination, as for instance a dream. An embodied image is in a permanent state of being created. When creation stops, the dream is over. Through extreme slow motion the alchemist participated in this ongoing creative process of primal matter, which began to pervade him, exteriorizing its inner sparks to the alchemist by way of the inversion process discussed previously, so that he could know its hidden self and partake of its intelligence. The primal matter of metals was called “alive silver,” argentum vivum, quicksilver, mercury. This alive silver had to be purified, cleansed of all its ill aspects, eventually producing a golden tincture which could heal all substance: turn lead (which they considered a sick form of alive silver) into gold (its most precious condition), a sick body into a supremely healthy one. This was done by the art of the fire. Alchemists would melt, in the way of ice, the crusted outer coagulation of metallic bodies, making them flow alive like quicksilver, in order to obtain the creative sparks of primal matter, the substantive intelligence around which the metal had embodied. Unveiling bodies unto their naked intelligence was necessarily a slow process, as is all embodiment work. And as the alchemist gathered sparks, the creative potency of primal matter increased. The result was to be an ultimate medicine of such creative intelligence that it could heal all bodies, ranging from lead, an afflicted metallic body, to the diseased human body itself. Many alchemists were medical doctors. They would make this medicine from poison. The word they used was pharmacon, which means both poison and remedy, from which we derive our “pharmacy.” Only from what is afflicted and its affliction could a medicine be made. This extraction of medicine from affliction they called the process of refinement. The ultimate medicine was named tinctura, the coloring agent. The tincture was of such refinement that it was almost a pure disembodied spirit, pure abstraction, like mathematical structures; yet almost is the operative word. While science after them went all the way through to mathematical abstraction, alchemists always worked with particular embodied substances, waiting in slow motion for them to reveal their intelligence. This highly refined embodiment, called subtle body, is a pure manifestation of primal matter. Subtle bodies are embodiments existing between physicality and abstraction, in a realm of quasi-physicality, which we have called embodied imagination. Subtle bodies belong to a primal world between body and mind – less physical than matter, more embodied than mind – and their very existence annihilates the mind/body conundrum by adding a third, an in-between: primal matter. This in-between primal matter is both embodied intelligence and physical body, partaking of both inspired metaphor and physical anatomy. It was called soul-as-medium, anima media natura, soul stretched painfully between eternal abstraction and decaying flesh.

[END OF COMMENT]

That is a very mangled piece of writing! To modern ears, that is. It seems to be rooted in the older traditions, almost like a historical study, but then linking that to the modern concept of imagination. That alone makes it quite interesting. Have you ever encountered Jerry Epstein and his use of imagery for healing? I read one of his books a long time ago (it might have been the Waking Dream Therapy one, I was doing the lucid dreaming thing at the time) but your post reminded me of him - and he seems to have expanded things a little. The collection of imagery exercises on his website are very "dream logic" and pretty close to what we've been talking about as a modern take on this approach.

So if we take this literally, you can basically talk to the metals and convince them to change, because you'd assume they're not just dead substances, but are living beings.

Well... extended patterns. You could certainly have the world behave as if they were alive and had properties that could be described as intelligent, I suppose. However, as with everything else, it would be your intelligence, creating the maps, albeit by implication. Reading that sort of material can be great for triggering fresh ideas for causal imagery, ones that would never occur otherwise, you're leading me to think. I'm off to make a cup of coffee and talk to a stainless steel spoon about empathy...

I might think, oh, I see, so now I really understand it, whereas when before I thought I understood it, I've only understood it partway in reality.

I completely agree on this. I've come to think that it's another aspect of the "after the dream... more dream" thing. It's in the nature of content that it is always apparently expanding; the discoveries keep coming, so the context keeps changing, so the understanding keeps evolving. Which is another way of making it obvious that the truth you can think, can comprehend, is not the truth (because the actual truth must be unchanging). The fundamental truth is something that can only be perceived - known directly, now - and is not something that can be thought about.

I don't think the fundamental truth is ever perceived because perceptions change and are selective, whereas the fundamental truth is unchanging and is beyond selection/deselection. This is why it's so damn hard to remember what it's like to be enlightened! If the fundamental truth was plainly obvious, everyone would always and ever be an enlightened being.

Yes, I really mean that "the fact of being and being everywhere" is always available and can be known. As I've just said in a comment to /u/3man, you never experience purely being The Absolute; you are always "The Absolute taking on the shape of The Relative". You would have to have absolutely all patterns at zero contribution for you to just "be". The blanket of material with no folds. Which is not possible, I would say, in the sense that if it ever happened, that would be it, or rather only "it", so to speak.

Why would this state be called "being" or "just being?" It seems arbitrary.

Yeah, it is arbitrary. There's no word for it. "Only awareness", perhaps. "Absence of activation", maybe. It's the only state, or non-state, which is truly meaningless. It would be "before" everything. Meanwhile: I will reply to your other, longer comment later today. Want to read it properly non-mobile and give it due consideration.

POST: Wu Wei, pt. 2

[POST]

This idea just came out my noggin. The continued allowance of freedom to all thoughts may just allow the truest of thoughts to be created. We spend a lot of time trying to dictate our thoughts in one direction - nothing wrong with intending where you're going - but what if we're missing out on certain avenues because we ban certain thoughts. Because get this, we're afraid of what those thoughts will lead to. What if we just allowed them and then surprise, it turns out the lion was a small cat waiting to be cuddled. It's worth a shot, in my opinion.

[END OF POST]

Define "truest", I guess. Do you mean, that the thoughts that arise will be ones where all information is taken into account - so, the "truest" reflection of the current state of the world in its entirety?

If I am the absolute how come **I do not know that I am**? What robbed me of this information that should be fundamental?

Interesting accidental wording! In fact, "that I am" is the only thing that we do know for certain. And that's quite a good starting point. Even now, you don't necessarily "know" you are The Absolute, you simply "are" it. Intellectually, you can only infer that you are the absolute, perhaps by noticing that everything changes in terms of content but you (as a feeling of being) always remain. Experientially, it's similar: you find that your direct experience does not correspond to the idea of separation, and perhaps you have a particular event-experience in which all the usual content seems to drop away. In all cases, you are The-Absolute-taking-on-the-shape-of-The-Relative or in other words, you are always what you are and having an experience. The situation where there is no shape you have taken on, "pure Absolute", is a hypothetical one. However, there is always that sense of "being"...

We maybe need to ponder what we mean when we use the word "knowledge"?

My usual metaphor: the blanket of material whose only property is awareness. The blanket has folds in it: the blanket experiences itself as one fold relative to another fold, in all directions. In what sense can the blanket "know" that it is everything?

- **Conceptually** - It can create a fold which represents the fact that it is the whole blanket and all folds. But that knowledge will always be a fold, it won't actually be the truth in and of itself.
- **Directly** - It always "knows" it is the blanket simply be being it, without reflection. When we touch a table, the "hardness" is the direct experience. But do we "know" that the table is hard before we have reflected upon it?

In other words, you never forgot that you were The Absolute, it's more a case of you never intellectually pondering it. You have always known that you "exist" though and that existing is direct knowledge of being The Absolute, just not of its implications. Another thought experiment: how did you come to "know" that you are a body, in a general sense? In actual experience, you are always 3man-sitting or 3man-standing or 3man-walking. There is no generalised sense in which you are a body, in actual experience, surely?

But I'd say direct experience of knowing you are it all - "being" - is special because it never changes and is always there, in a way that the body isn't quite. It's sort of everywhere, and is the only fact that is always available at all times and places. It has no content, so it needs no context. Maybe the distinction we need to make is between: the knowing and the meaning?

POST: No-self and other minds?

One approach is:

- Instead of thinking of yourself as a person, think of yourself as an "open aware space".
- Instead of thinking of the world as a "spatially-extended place unfolding in time", think of it as a toy-box of all possible patterns, dissolved into the background of that space.

Right now you are experiencing a particular combination of patterns. A particular combination of patterns = a "world". In other words, you have taken on the shape of being-this-world-from-the-perspective-of-this-person. And the same is true of everyone else. We-as-consciousness share the same world in the sense of all accessing the same broad set of patterns. However, we are not doing this in the sense of sharing the same time or space, because time and space are part of the experience, not part of the larger context. You can conceptualise this as each of us having a turn at being a world one after the other, or as existing at the same time but separate, or as one consciousness doing both parallel-simultaneously. All of those are wrong, but it gives a way to imagine it. And you tend to find that the way you imagine it, becomes reflected in your experience - so it is "true enough". Subjective idealism but not solipsism.

Q: Right now you are experiencing a particular combination of patterns.
To restate this in an interesting manner, a particular combination of patterns is creating the "you experience" within the whole

No. He says sternly! ;-)

Patterns are not creating anything. Patterns don't "happen". The combination of patterns is the experience. And it's not just the "you experience", it's the whole thing always. It is better described as the being-a-world-from-the-perspective-of-a-person experience. You always experience the whole, it's just that, as the intensity of the sun in conceals the stars the daytime sky, some aspects are "brighter" than others. So if I was going to be super-picky I'd revise my wording this way:

- Right now you are an "awareness" which has taken on the shape of an experience. This experience can be described metaphorically as a pattern which corresponds of the sum of all possible patterns, each of which is contributing at a different level of relative intensity.

I guess the important thing is the idea that we are the only things that ever "happen", and that "happening" corresponds to shifting our state = the relative contributions of patterns. Our ongoing experience is not such a shifting though; it is a revealing of the current state. A state fully defines the entirety of the world over all time.

The problem is that not everyone knows about the language of selectivity as emphasis, and why that can be important, so you can be sure you're losing a lot of folks who don't follow your every word when you say stuff like "each of which is contributing at a different level of relative intensity." The only people who will know what this means are the ones who've been reading your prior posts. Other than that, they'll just be shooting from the hip when replying.

What, people aren't following my every word? Then I have no sympathy whatsoever! They should get with the programme here! ;-)

This is a problem, though, with reddit and online discussion in general: how do you build up body of knowledge and refer to it? Without any accumulation of terms and imagery it's - well, not quite like having a memory reset every time there's a new post, but it probably is like having a reset every month or two. And if nothing else, it gets boring providing context every time, and later it gets hard to distinguish what is the default view, and what's novel with your own view. For instance, one of the first things we have to get to grips with is that the world is not a "spatially-extended place unfolding in time" beyond our sensory experiencing of an aspect of it. Perceiving this changes the context of everything, and without that foundation in place, discussions about subjective idealism are basically "structurally wrong". So, given that, do you start from the ground up every time?

Although having said that, I do try to make things progress fairly logically, albeit in abbreviated form. If something doesn't make sense but is interesting, people can ask. If it's not interesting, they can ignore. I personally think an eclectic, mood-based approach probably works okay - because every comment isn't just a response to a post with a pre-made view, it's also an exploration of your own view, from an imposed perspective, leading to a spontaneous reshaping in real time. Sometimes this means we veer off the tracks a bit in our writing - our thinking might become a bit opaque to others, since it temporarily becomes that to ourselves - but this breaks through into improved clarity for everyone later. Today's custom-concept-laden, insurmountable mountain of a selfish response is really the foundation for tomorrow's transparent, easily-shared, transformative insight.

I strongly agree. I don't think you're doing anything wrong at all. I hope that's not how I came across. My only point is to try to clue-in some stragglers who otherwise might be curious.

You raised a really good point though: over time, through our participation on this sub and others, we're building up a set of different perspectives that are quite powerful, but it's distributed across a few posts here, a few comments here, intertwined with discussions, and it's like we're keeping them alive by partially reposting them in responses. When we stop typing, it'll all disappear. (Apart from the sense in which it's always been there.)

Yea, it's true. Except it will not easily disappear from my heart, and probably not yours either. Of course inside all-potential everything is also available. But personally I don't want to see the ideas that I like get turned into a religion. Ugly things tend to happen when things become religions.

Agreed. What I want is for things to be useful. There is nothing to believe in. I think when "teachings" turn into "stagnant beliefs", that's when the troubling side of religion appears: it becomes all about the organisation, rather than power for the members. (The Quakers had it about right I think)

One possibility from a while back was to evolve the wiki from its current form (the "key posts" section is very recent, actually, it wasn't even that before) and expand it into something which amounted to a more thorough write-up. Particularly since many of the "goodies" are lost among the numerous discussions in the comments sections, which aren't always directly connected to the posts they appear under. This, in effect, means there's no real place to go to find the full picture from any of the authors. We [moderating authors] probably diverge a bit on the details (e.g. my whole "patterning" thing is bit of a separate branch, I suppose, so I've tried not to go overboard on that in this sub) but I do think it would be nice, at some point, to have a more comprehensive overview of the subreddit's output, and even make a plus out of the contrasting aspects (which are really more about preferred metaphors of course). So, good idea, thanks for the prompt.

== you'll very very likely find out how Nefandi and TriumphantGeorge were wrong too==

Yes, and I think that's an important thing: subjective idealism is, in a way, about "never having to say you're right". Because the content of experience, which includes ideas, is never correct or fundamental; it's shape is completely open for shifting. Which points us back to that whole thing of the only truth being that we are experiencing, not what we are experiencing. If we've accomplished anything here, I think it's that we have reached ways of talking about things which are some of the most flexible available: they avoid saying anything is fundamental, while still offering a way of conceiving of things and so making changes, rather than just saying "not this, not that" or that you'll have to wait for "grace" to give you an experience of openness. We're saying: here are some ideas, and if you use them, you can have experiences which will reveal to you that things are not what you assumed, rather than just "hoping" that one day something will happen for you. I think that's pretty good going for a little subreddit that's only being around for a year - probably because we happened to bring together in interesting mix of participants who have slightly different angles not the same thing, revealing each other's assumptions and producing a purer version of the total. Well done us! (Or should I say: well done me's!)

I guess I'd say that, being "true" means "being right for you" (which can change, obviously). Whereas we can go through periods of trying to be right for others, when all we can really be is helpful or useful, free with our insights. Something that I notice heavily is that people want you to convince them that they can do something, or that something about their own experience is true. And you have to say really: look, only you can experiment with your own experience, only you can find out whether you can do something or not. Thinking about it, talking about it, won't do anything. It's like drawing pictures of the beach to in an attempt to see if the weather is warm at the coast, and refusing to actually go there until you've felt some heat from the crayons.

Thinking about it and talking about it can be helpful, but not in the way some people imagine.

Right, so to clarify a little: having a discussion about something does intensify within people the corresponding worldview, and they will have a little bit of the corresponding experiences as a result. But, if they never take the time to do that for themselves, then they haven't gained a whole lot. They can get addicted to thinking, talking about things because that's the only way they get a taste of the experience. They still want it to - as you say - be a "knowledge download". But it's always up to you to trigger the concepts within yourself; they don't persist otherwise, and you'll come complaining (meaning: the person will) that "it's not working". And the answer is: "because you aren't becoming". True enough, a conversation doesn't necessarily trigger the worldview you are talking about, but it can at least trigger a variation of that, in the context of their own patterning. One might hope that this would be sufficient to pique curiosity and get people experiment for themselves; but it isn't very often the case. (Perhaps because most people don't really, deep down, want to "cheat" their accumulated patterning, even if it would transform their lives from misery.)

This might be a bit of a tangent, but I also discovered another possibility for why I might not want to cancel all the misery immediately. For me I think there is a hidden desire to be able to "reply" (as it were) to any state honestly and forthrightly. So in other words, I don't so much want to remove misery, as to be able to say freely, without reservation, without fear, "fuck you" to misery. It's like a desire to be someone other than a victim in the face of a bully. To prove that you can do this you still need someone or something to play the role of a bully so that you can blossom on the inside into someone fearless.

True, this isn't muffins, this is reformatting yourself. And once you know, although you might wish you didn't know, the fact that you know means that you will never choose to un-know, because that would be to deceive yourself, um, knowingly. Pretty much nobody wants to be the guy who likes his steak in The Matrix.

So, on the "reply" thing, that's interesting. Say I'm in a conflict situation. I know (that word again), that I could just "delete" the situation if I wanted. However, that tells me nothing about my courage to meet the situation on its own terms, and triumph. If all I ever do is delete uncomfortable situations, then I am not truly exploring my experience and all that it can be. Also - later - being certain that I am "secretly safe", I might conclude that life is all about such experiences anyway, and without them I might as well just "skip to the end" because I won't be having fun - or at least, not learning new things. And that points to something: some people become concerned that by doing this stuff, life becomes a different sort of churn. But actually, the mystery never goes away, and in fact becomes more obvious due to its clarity: you never experience something prior to experiencing it; it's always a surprise, in the details, even if they are laid out before you, due to your intentions.

For any subjectivity that uses any non-trivial amount of othering, I agree, there must be some surprises, at least in the details. Thing is, I can't imagine why anyone wouldn't want some degree of othering, because it's so damn useful. For one thing, that's how we automate the boring stuff.

Well, it really is mind surgery, you're right!

Agreed somewhat on the wanting to return to oblivion re: the syndrome syndromes, although might that not be due to the lack of understanding? Depersonalisation is, I'd say, another form of localisation, just shifted spatially somewhat (in terms of the experience). You've gained an insight, but without context you are powerless to use it. So really what we're talking about, in that latter part, is freedom - the lack of a need to do any particular thing, and therefore the ability to choose to do anything. And mystery, really, is a contributor to freedom, and to adventure. And ironically, the more that is "othered", the freer you become: intend what matters, let the details autocomplete!

Sort of! :) But 'othering' is not a freebie. The downside of 'othering' is that processes tend to then take on a "life of their own" as it were, and there is a risk they become renegade processes which no longer serve anyone's interest but "their own." I view 'othering' as I do fire: very very useful, if you're careful not to set your house on fire.

That's all part of the fun, though! And of course there's no certainty that micromanagement makes you any safer; "manual" operation means you can't take into account the larger context, which you get for free when you let existing patterning fill it out for you. It's a matter of taste, but I think occasional course correction probably makes for a better life overall. Either way, it's still better than "normal" life, which is blind in action and understanding. So it's a matter of perspective (adopted, literally). If you step outside the frame completely, you've got what amounts to an "eternal static pattern of perfection" - but basically no experience. With too narrow a frame, you're left with a sort of blindness with things thrashing at you from nowhere, a completely dynamic experience with no stable platform. Once you've calmed yourself down though, played with this for a while, then things line up a bit and the (apparent) chaos subsides, and you can trust more, especially since your intuition tends to be clearer, so you do in effect see beyond the immediate 3D-frame.

Perspectives: I really did mean "literally" on the perspective thing - as in, viewing something from here... rather than here. Seeing the whole pattern laid out, versus being "inside the maze" and not being able to see around the next corner, only having faith that your intentions are always fulfilled. That kind of thing.

Tending the garden: Well, that sounded very Biblical Parable! And that's not necessarily a bad thing at all.

The Biblical reference wasn't judgemental there; I think that book was originally a perfectly decent attempt to codify a particular description of reality (namely: the apparent internal shapes the apparent external), which has become somewhat corrupted by poor and culturally-unaware interpretations. So it's not a bad source at all to pick from, I'd say.

A perspective doesn't necessarily mean visual; it's a relational thing. It really means the balance between the explicit and the implicit - the proportion of information which is unfolded into awareness vs that which is not. If the world is an eternal informational landscape, then one's perspective dictates the radius which falls within one's perception.

The problem is that the Bible never (please correct me if I am wrong) conveys that God is the innermost person inside the person...

It kinda does, via metaphor. God, Jesus, all meant to be aspects of you, in the early interpretations. All that stuff about fathers and sons, seedtime and harvest, forgiveness and non-judgement. Unfortunately the subsequent religions (as distinct from the early Christian movements) flipped that around so that God was something external to be worshipped and pleaded with, rather than internal and to be attended to.

To me the term "perspective" means that whatever you experience is a result of a specific manner of experiencing.

That still applies here. On the landscape and radius, yes it's metaphorical. The notion of "proximity" depends upon the particular aspect we discussing. In this case, I'm referring to the ability to perceive outcomes.

Talking more plainly: right now, I may have set various intentions, but all I am perceiving is this room around me (simplistically speaking). However, I may have a sense of the next-moment, of outcomes through intuition. If I could "step back", although not 3-dimensionally, then I would have access to a greater degree of temporal or event information. We could call this our present "knowledge horizon" or something; but what it's trying to convey is that you can't have both a dynamic experience and the experience of the full set of outcomes.

What can I say? The Bible is a product of its time! That's why we have to rewrite this stuff in modern language periodically, as the old descriptions stop being understood. If those parables had been written "straightforwardly" they would have made no sense to the readers of the time. For instance, the ideas of "reality" and even of "person" probably did not exist in the way they are used now. The concept of even an individual distinct identity is relatively recent. The Bible as it is now (the official selection, as it were), is obviously compiled from the viewpoint of a hierarchical religion with a certain power dynamic, but that doesn't mean the message is gone, if people want to use it as their entry point. (Not something I'm recommending; I'm more indicating that those who are already dedicated to Biblical studies might find the true message is not what they are being taught in Sunday School.)

It is unlikely Jesus was a historical character - probably an amalgamation of various stories and parables. Y'know, and the Old Testament is fun, right?

But this "stepping back" is moving through a different from conventional dimensions. And a dimension is a narrative. That, by the way, is a recent insight I had: dimension is narrative.

For sure, yes! It's perhaps best to think of dimensions as, rather than spatial extents, rather as stories enfolded within stories, like an origami sculpture. I see the next level up from here by "folding" this room into itself spatially, and that's what leads me to the "higher" perspective.

So even if you take only the very old documents, I don't think the Bible fares very well.

Yeah, I'm not recommending the Bible as the go-to text for today, just saying that it was an attempt to codify this knowledge, rather than a bunch of little moral tales as it often seems to be presented as. On the historicity of Jesus, I mean that the stories themselves seem to be a patchwork of different characters; but then the Bible wasn't (I suggest) aiming to be a historical account so it doesn't matter much. It's probably unfair to compare Buddhist texts with early Christian ones; I don't think they were on the same level. The Western texts don't seem to do abstraction very well; they don't really explain, rather they guide behaviour?

One of the nice things about idealism, of course, is that we can happily construct pseudo-spatial spaces consisting of meaning, and not have to suggest they are less "real" the "proper" dimensions - since we don't reify the physical concepts anyway. I really like your description of orthogonal narratives - very evocative. We could also apply the notion in a more granular way: orthogonal facts. One could actually create mental structures for this, perhaps, and flip through them as part of a more general organising principle.

I agree, but the Bible was never meant to be a document about transcendence and thus, never about spiritual liberation. It's a document about law. What you can and cannot do as a human on Earth. The Bible is less a spiritual manual than it is an early codex of law. So the task of the Biblical authors is almost literally the opposite of someone who writes about liberative spirituatlity. The task of the Biblical author is to ground you in this here bad dream, and make sure you can't escape it. The point of the Bible is to clip your wings! It's to put you in a small cage.

I don't agree with your assessment of the Bible. I see it as an attempt at a "how-to" manual; and early example of self help. It doesn't make sense to compare it to deeper texts, because it was never meant to be that - in fact, it was probably never meant to be a single book in the first place. As you imply, it was a bunch of oral stories, which got written down sooner or later, and combined with some other material that fitted the purposes of the 'publisher' of the day. We probably have to make a distinction, I suggest, between the original material and its purpose and context, and the 'collected works' and intention of the later compilation.

Hmm, pondering this: it's interesting that while the West has become more adept at abstract thinking, it has at the same time I think (as a culture) grown more literal. The older civilisations basically communicated in metaphor, it seems (perhaps due to that oral tradition), and what's happened here is that we've stratified: high abstraction - gap - literal structures. What we do here in our discussions, is perhaps the filling in of that gap, using the full spectrum of thought to make connections.

But do you at least agree with me that law-giving and spiritual liberation are mutually contradictory concerns?

There is the possibility that, through the application of law, one might gain insight from the experience - but I do think that it's more likely you have the experience but don't get the broader meaning.

Yeah, I bet them desert fathers had a few more secret stories on the go...

I think the re-inclusion of subjectivity might turn into a broader trend. It's relatively recently that "objectivity" was jumped upon to provide a simplifying concept to make it easier to create explanations. But a couple of recent approaches in physics are flipping it round and saying, let's start with the subjective angle ("private views") and, um, we'll worry about connecting things up "objectively" later. We may yet see a resurgence of, and a reunification of knowledge by, subjective ideas - if not idealism, exactly. For the subjective view stuff, check out Christopher Fuchs' work on QBism. It's a fairly readable introduction. An interesting development, and (at last) a move away from many-worlds and all that other nonsense. I wasn't talking about any particular approach, just that a revisiting of the subjective frame will lend itself to a folding back of "objective" knowledge. What the theoretical context for that would be, I don't know - it might be idealism, but I figure there would be a few stepping stones before it got to that.

Have you ever seen Tom Campbell's videos on youtube?

Yeah, Tom's good, I just dislike the implication that something is "happening" in the background, and so on, other than experiencing - that the simulation is "running" somehow. As you say though, he is thought-provoking, and he is leading lots of people in a good direction, even if they have to throw the ladder away when they get there (which applies to most metaphors). He clearly delineates the parts of the model and connects them to the everyday world, and he even brings Robert Monroe back into awareness as an interesting guy, rather than as some bloke who just messed with OBEs.

Signing off for now - check out that Quanta article and tell me what you think. You can safely skim over the parts which are too physicsy and still get the gist, I think.

Q: I am reading this QBism grimoire by Fuchs, and here's a juicy quote from it:

QBism says that every quantum measurement is a moment of creation, and the formal apparatus of quantum theory is an aid for each agent’s thinking about those “creatia” she is involved with. But surely a Copernican principle applies just as much to QBism as to any other science. QBism’s solution starts by saying the last point just that much more clearly: “Quantum measurement represents those moments of creation an agent happens to seek out or notice.” It does not at all mean that there aren’t moments of creation going on all around, unnoticed, unparticipated in by the particular agent, all the time. The larger world of QBism is something aligned with James’s vision of a pluriverse where “being comes in local spots and patches which add themselves or stay away at random, independently of the rest.”

So, guess what? You probably wouldn't like QBism either, based on at least this one passage.

Well, I dislike aspects of it also - but that doesn't matter, because if I loved every aspect then it would be... me! We have to be careful about "moments of creation" and so on. Better perhaps to say "moments of definition" or "moments of fixing" or "moments of intensification of the contribution of a particular fact". There are no moments of creation, in that sense, other than something unfolding sensorily into consciousness plus in effect the facts implied by the content of that moment (since the world is always coherent between shifts).

Remember what happened when I was exposed for the first time to your style of thinking? How many questions I was asking? Things like "enfolded" and "unfolded" made absolutely no sense to me. Well, just how many people have been asking you about that stuff besides me?

With the "imagination space + patterning" type metaphors it's much more intuitive generally. Since I've got people actually using that to update perceptions and create changes, it's much easier for them to connect to direct experience (which is of course the aim).

POST: New here, and I have a question.

All experiences occur inside 'experiencing'. Even ideas about an "outside" of experiencing, occur inside of 'experiencing'.

We can fantasise all we want about what is going on "out there", but it will still just be a concept "in here" - with "in here" also being a concept. You never experience inside or outside really. All we ever encounter is our own mind, taking on the shape of a particular state, from which experiences apparently arise. In fact, you can easily demonstrate to yourself there is no outside - by trying to find it, right now!

Hint: First direct your attention towards "the place you are looking out from" as you read these words right now. Continue onwards as far as you can, see if you can find a boundary. Now do the same in all directions. Now try and find where "you" are. If you think you find yourself, ask why you are able to see yourself, from the outside. Realise that this means you are the outside too, which is therefore also inside.

...

"Materialism" is a conceptual framework, which arises subjectively in people's minds. "Materialism" is made from thoughts and is nothing other than that. It's a potentially useful way of thinking; it might lead to interesting ideas for creativity and behaviour, for instance. But it cannot "give rise to subjective consciousness", because it is itself dependent upon it.

For your example -

You are already in that position, of being "objective inside of your own mind". So, in what sense do you know everything or perfectly understand the system of your own mind? You'll notice: All you ever come to appreciate is relative truth within the content of your experiences. And it doesn't matter at what scale this operates at. This is separate from the nature of experiencing, which is fundamental (unchanging) truth.

So a way to get to the heart of it, right now, is to realise that the nature of your experience remains the same regardless of its content, and that since content amounts to patterns within the mind, it makes no sense to talk of the mind arising from content.

To reuse a metaphor: If your mind was a blanket of material, and the folds within the blanket were the content of your experience, is there any arrangement of folds which could fully capture the truth of the existence of the blanket?

POST: Morning Lucidity (new lucidity technique)

[POST]

So this morning after having a ton of weird dreams from unregular sleep i had some insight into a new lucidity technique. When i woke up this morning i was super groggy and slept in much longer then i usually do, yet when i was lying in bed still awake, it kind of still felt like i was dreaming because i was so out of it. The morning seems to be a good time to work on lucidity insight mainly because you have just been dreaming and its fresh on your mind. So this technique for lucidity is rather simple. The second you wake up in the morning instead of telling yourself you woke up, you instead try to feel that this is yet another dream in the sequence. The closer you can do this upon the ending of the dream the more effective it should be. It would probably be most effective if its after a particularly vivid and memorable dream as well.

[END OF POST]

Q1: Its not really a new technique, its called DEILD, dream exit induced lucid dreaming. A fair few of my LDs have been induced this way

Q2: this technique is used to make waking reality seem more dream like, not to induce a lucid dream just to make that clear

Q3: Is there a difference? This is one thing I've been wondering about for a while. I've had a number of experiences that lead me to suspect that waking reality is really just a lucid dream where we are dreaming that we're not dreaming.

So there's a threshold of disbelief that, once breached, makes it obvious one is in a lucid dream and so one then treats reality as such and if shit gets weird one just wakes up in bed. But if on the other hand one wakes up into a lucid dream and nothing is weird, the belief tends to be, "ah this is waking reality" and so it is treated as such.

Is the point you're getting at with making waking reality more dreamlike vs inducing a full-on lucid dream one of stability so as to not wake up from the dream? I'm not sure if I'm following.

I think what he is getting at is simply using that moment upon waking to assert to oneself that the day that is about to commence is no different in essential quality to a dream (contrary to one's usual assumptions); to bring the "sense of dream" you still have upon waking on, into the day with you.

It is true there is no difference in type between waking and dreaming, but we do not normally act as though that is the case, even if we recognise it intellectually. I think his exercise is a suggestion for bringing it over, as a feeling, into actual experience via intervention.

(I'm reminded that Tenzin Wangyal Rinpoche's The Tibetan Yogas Of Dream And Sleep, on our reading list, has a similar idea where you assert that "this is a dream" throughout the day, and ongoing experience starts to fall into line with that assertion over time, such that it is sensed to be a dream.)

Ah ok. Yeah I've done some practice with reminding myself, "This is a dream" throughout the day, but without that felt sense, it's not very effective. This is a pretty good idea the more I think about it. Setting that intention to do it right away in the morning would be pretty powerful. Back to the felt sense, does one need to have to felt sense in order to experience waking reality as a dream or can one come from a place of not having that felt sense and start acting as-if anyway in order to obtain the feeling?

So, of course it's always true anyway, regardless of the feeling you have. The feeling is, after all, just another experience. Reality is always a waking dream, even when it's a waking dream of "feeling that this is a world based on a solid persistent substrate". This means that the power of direct intention is always available to you (because of course that's how the whole thing came about anyway, and it's how you are moving your arms and legs right now).

Therefore, if you do want to generate the feeling, then you can just-decide it directly - or you could intend something else that implies-that you have the feeling, as part of its

larger pattern. As you say, performing acts which correspond to a dreamlike reality, thereby triggering the extended "life is dreamlike" pattern, would be one way to go about that.

Again, though, you can just "know" it without having the feeling, but I do agree that having the feeling within experience means you have a constant reminder, or presence, which can prevent you getting lost in the dream-as-solid-reality again.

it even makes sense if you logically think about it - thinking about reality can be condensed into one thought strand and set about as a construct upon itself or within others but then what makes that so? is it you? is it every poster on reddit or the people on the street or the Jews or the government? it has to be me and there are hard limits on others on what they can do even if their souls are unaffected, their actions are limited - otherwise I would not be able to accomplish anything except at the behest of others' desires: I would have to follow all laws of whoever is in government, I would be subject to arrest for any number of things I do or say, and their religions/beliefs would tower over mine.

Strands which are thoughts about the world, are basically parallel worlds all on their own.

There is only you, so you don't need to concern yourself about the limitations of others. However, this is you-as-awareness rather than you-as-person. There are in, fact, no "worlds" or "people" at all in the sense that we usually conceive of them - as external and independent objects and beings that are "happening". Rather, they are patterns in awareness, and you-as-awareness is the only thing that is ever "happening".

There are no souls beyond the concept "souls".

right, or parallel universes

Yes. So - when I say "world", I don't mean it in the sense of "planet". I mean it as a "self-consistent coherent realm or pattern" or something like that. We could equally use "reality" or "universe", depending on the associations of those terms for our target audience. What we don't mean, though, is something like a "place".

then who is another? i mean, there must be other existences of others not-perceptible within any universe

What "another"? Have you ever encountered "another"? And what does it mean to talk about something which is "not-perceptible". If you are talking about something, then it is perceivable in some form - even if that's in the form of an idea. Which loops back to what were were saying previously: aren't ideas basically patterns and worlds, and those "just" ideas?

then couldn't i have the idea of another existing in a separate place - i.e. an entirely different being separate to every universe that could exist within the range of my all-possible universes

You could. But that would just be an idea in your current moment of awareness. It would be a thought "about" something; it says nothing of its actually happening other than it is happening in thought, now.

who is the actor in, say, my parents? even if all bodies are controlled by me , the experiencer could be different

Hmm.

What "experiencer"? Pause now, and try to find boundaries or multiplicity in awareness. Try to find an experiencer. Where is it? There is not even one experiencer; there is just "experiencing". It makes no sense to talk of multiple experiencers - or experiences. Even the idea of "other experiencers" is... an experience, one of them, now.

Are you "in" you? Are you an actor "in" you? If you are thinking of answering yes, pause more, and try and identify where it is. Now, consider again what it means to talk of an actor "in" your parents.

There are no actors, I suggest. Nothing is happening, except this experience, now.

but that is a thought about me

How can you have a thought "about" you? What does that mean? Is any thought actually about you (in the sense of capturing what you are about)?

but could i not 'let' another have an experience within my experience?

What other? There aren't any others. Strictly speaking, it's not "my" experience; it's just experience. "My" is itself an experience.

No thought can capture the medium within which it resides and of which it is constructed, surely? You can't think about the actual you; you can only think other stuff and call it, incorrectly, "you".

Direct investigation reveals that experience has no boundary, and hence no "outside". Any idea you have about an outside, is just a thought of the idea of an outside - inside.

Who says that people are liberated? I suggest that people can't be liberated, because there are no people. However, "that which has and is experiences" can shape-shift such that it is no longer under the illusion that is a particular shape (in this case, the shape of apparently being-a-person-in-a-world).

In what sense does there have to be a "purpose" to experiences? The idea of "purpose" is itself an experience - of thinking about the concept "purpose".

why bother having an experience unless it is for a reason?

Experiences - in fact just-being - is its own reason. That isn't necessarily the same as a logical reason, though. It is important not to conflate thinking (e.g. mulling over concepts about life and experience, and ideas such as "reasons" and "purpose") with the main strand of experience.

Thinking about "a purpose" is an experience. A "sense of purpose" is itself just another experience. You might as well ask, "what is the purpose in having a sense of purpose?", and so on. You can do that, but none of those answers will matter in the slightest really; they are parallel, and say nothing about the fundamental situation.

If you need something to hold onto, though, one might say that the reason to experience anything is simply the feeling of wanting to. Any unpacked, narrative reason is just arbitrary story-making to justify that feeling, or desire.

isn't that a reason? the reason to be is to be

Yes, but with a small caveat. The difficulty is, the "reason" that can be described isn't the actual reason. "Logical" reasons and "direct" reasons both appear identically in written language - and so the two get confused. It's another aspect of that thing where, when you discuss "the nature of experience" most people immediately switch their attention onto some thinking-about experience in order to explore it, rather than attending to actual experience. Often, discussion don't emphasise the difference, and so people talk at cross purposes. Not us, though, eh? :-)

as i said before i mostly see deductive / thinking-about experiences peppered with the occasional insight. this is no good to me because i never have any actual experiences involving another but instead have thinking-about time-wasting exercises.

Yeah, I get you.

Well, you do have experiences involving "another" one one level - it's just that you-as-awareness are "taking on the shape" of the experience of being this-person interacting with that-person. They are both what-you-truly-are, but since that "you" is not a personal you - and is undivided and therefore not really an object at all - then it doesn't devalue the interaction.

As with the whole solipsism thing, the error arises with from the fact that all thinking presupposes division - objects and relationships in mental space - and assumes that experiences is of that nature also, when it is sort of neither that nor not that.

i'm just fed up with the running-around-in-circles!

Just give up thinking about it, is what it comes down to eventually. You can't "solve" this in thought anyway, because it's not a "problem". Only the concept of it is. The only way to have an experience of something being a certain way, is to start viewing it that way. Things are no way in particular, inherently. That's why you can't work it out.

However, as you indicate, you can have an "insight" - an intuitive direct knowing - that things are a certain way fundamentally (that is, undivided and unchanging and containing all possibilities and all you-as-awareness). You can never reach this by thinking about it though, or by performing actions to get to it, because those thoughts and actions already imply division; that is enfolded in the intention.

All you can do, is bear in mind that it is always true that, whether you are experiencing division and location or blending and expansion, you are an undivided that which is "taking on the shape of" the experience of apparent division, or apparent expansion, and so on.

then how did i have those "insights"? if i could just have that insight perpetually - is what i'm striving for

There isn't a "how" as such, but I'd suggest it's when you cease holding onto your attentional focus, cease subtly constraining and deforming experience.

When people do relaxation or contemplation or releasing, while they might "let go of" their body movements and thoughts, letting them be, they often still hold onto their attentional focus - in spatial or content terms - perhaps just very slightly. This can be likened to allowing a piece of material to relax into a loose state, while still holding onto the edges. For sure, you not shaping the content as such, but you are still holding it in an overall state which is a deformation of its unmodified state.

So - you might have let go of 3-dimensional sensory content, but you are still holding onto the experience of 3-dimensional space itself, which prevents you having that direct intuition or knowing of the void "everything everywhere all at once in every location" truth.

But are there not infinitely many perspectives of this experience, now? How is one able to assume that what is being experienced from one perspective applies to all other perspectives?

There are infinitely many possible experiences, but that doesn't mean that there are infinitely many experiences that are "happening".

You might say that all possible experiences are "enfolded" or "dissolved" into awareness, but only one is "unfolded" or "condensed/expanded" into sensory experiences, now. Or you could think of it as having a book in your hand with 100 pages "enfolded" into it, but only one page is current unfolded as the experience of "reading". In other words, the world is basically static and eternal, and the only thing that is "happening" is the current experience of it within, and as, "awareness".

Although it's tempting to imagine that there are many perspectives or "awarenesses" that are happening at once, this is incorrect - because awareness is not an object, and has no boundary; there is no outside to it. It is not "an awareness" it is just "awareness", which you might conceive of as a sort of "material whose only inherent property is being-aware and which takes on the shape of experiential states".

Furthermore, not being an object, it does not exist within time - rather, apparent change is something which is part of an experiential state. So it is meaningless to talk of "awarenesses" or experiences happening at "the same time"; spatial-extent and passage of time are part of an experience, not part of awareness. This also means that you are not a person, as such.

The current "shape" or state you-as-awareness has taken on, then, is that of apparently being-a-world-from-the-perspective-of-a-person.

To take what you're saying literally seems to imply that what I'm witnessing is not two people having a conversation on the internet via the use of human bodies but rather just my own mind communicating with itself with no existence of said bodies on computers somewhere else.

It's tricky to talk about because the "I'm" you refer to isn't you-as-person and when we say "witnessing" we have to be careful we don't imply that there is some sort of separation - this isn't a situation whereby there is an observer and then a thing that is being observed.

In your current moment right now, you can easily notice that although you are having an experience of apparently "being over here with the screen over there", in fact when you go looking for yourself you discover you are sort of "everywhere". (This is best done with eyes closed: attend to your body sensations, then attend to distant sounds, and try to identify where "you" are - in particular, try and find the "edges" to your experience.) In fact, you'll discover you don't really have a human body at all as such.

So, it's not a case of "my own mind communicating with itself": there is no communication happening; there's a sensory experience "as if" two people were talking. Fundamentally, though, there are no people as we usually conceive of it. There's just a particular total pattern in awareness = a state.

Now, written down like this, that sounds quite start and lonely, but that's where we return to our early points: awareness isn't a "thing" and also it isn't made from anything; it is undivided. This means that the entire situation is always one of fundamental "aliveness" and "oneness". Therefore, you-as-awareness is in fact the total aliveness of the world, taking on the shape of anything - albeit not in the way you might have originally thought. That is, the world is more like a dissolved pattern than it is a "spatially-extended place unfolding in time". However, that does not make it less "real" or "existing".

In fact, it makes it more real than you might have thought, because it means that the world is more than the basic model you might have confused it with. What you had previously considered to be "real people" and a "real world" are, upon inspection, just some thoughts you were having about the world - inferior, empty concepts, parallel constructions lacking in complexity and momentum. The world-as-it-is, although of the same nature (patterns in awareness), is so much more than that; it is everything, always.

Hence, perhaps, "the world in a grain of sand".

This I can grok. I visualize it similar to a Mandelbrot set zoom. All of the patterns inherently exist as potential but only one particular pattern is in frame at any given time.

Right, that's one way to imagine it. I've used things like an infinite grid, or an origami fortune teller or an ink droplet analogy in the past. Basically, any metaphor that conveys the idea that the entirety of all possible states exists eternally "dissolved" into the background, and that from that a state is selected and a sensory experience is unfolded - but all of the same "stuff", that is "awareness". What's important is, not to confuse these descriptions with "what is really happening", because even those descriptions are themselves just more experience - and all that is every "really happening" is this exact experience, now.

Does "awareness" and "consciousness" point to the same place for you or are they different in the way you use them?

They're both rather corrupted words, I'd say. The problem with "consciousness" is that it's now used in at least three distinct ways, and those ways are conflated such that the meaning in this context can get obscured. The three ways are: "consciousness-of" (that is, the content of consciousness), "self-consciousness" (the identification with one part of that content as "me") and "consciousness" (that is, the "stuff" of experience). Here, we mean something like the final definition. I think that using the word "awareness" can be a bit better because, although it's often used to mean "the thing we have our spatial attentional focus on", it is vague enough to fit our intended meaning of "the 'material' whose only property is being-aware and which 'takes on the shape of' states and experiences".

The way I've been picturing it lately is as if "The One" has all these countless fingers of awareness that it started diving into this static Mandelbrot-like hologram with.

That's fine as far as it goes, but you are still subtly distinguishing between a thing that is aware ("The One"), and the thing it is aware of ("this static... hologram"). We really want our metaphor to convey that there is "that", and "that" is adopts the shape of experiences - and that experiences actually consist of all possibilities at once, just with some possibilities being "brighter" than others, hence "take on the shape of".

All of which is a battle to avoid accidentally talking about "that" as if it is an object, as a result of language only being able to deal things in terms of objects.

Which seems to imply that there's no way to know whether any of the other people in my experience have any awareness behind their experience or if I'm just looking at empty images and assuming they do.

Well, if you follow the above reasoning, the question doesn't even arise. There is nothing "behind" anything; there is no awareness "behind" experience, because awareness is what "takes on the shape of" experience. The only thing that is happening right now, is the experience you-as-awareness have taken on the shape of, right now.

Right now, how would you describe your experience as your respond to this?

I feel like I am an open space with sensations floating in it, in the form of the experience of sitting at a computer screen typing a message with a very welcome cup of coffee to my right hand side (and therefore in danger of succumbing to any sudden mouse movements). But what matters is, what is your experience right now as you read this response?

If you are having an experience, how do you reconcile that I also am aware and having an experience?

Not at the same time though, eh? But also, not not at the same time. It is more accurate to say that this issue is about how experiences themselves are outside of time. Experiences have the shape of time (ongoing change) and space (physical extension) - experiences are formatted as space and time, space and time are aspects of an experience - but there is no space and time outside of the experience of them.

The "Hall of Records" metaphor tries to capture this point. I'll attach it below in a moment, as a reply to this comment.

I've thought a lot lately about the idea of there only being consciousness. And how I've come to think of it basically is that we are all the same thing but this thing is capable of being anything.

So, being careful there: the idea of there only being "consciousness", which is different from the idea of there only being "a consciousness". There's a big difference to that, because the latter would suggest there is only the sensory perspective you are having right now, with no other possibilities, whereas what we are saying is that all possibilities are here and now, and so you can have experiences "as if" pretty much anything is true (including all those nice metaphors you've come up with). Leading us to...

I've noticed that after hanging around conscious beings for a a day or a few that it's like their dream stuff seeps into mine. For a while after leaving them my reality will be brighter. I'll be seeing all sorts of new plants and such that I had never seen or even knew existed before.

Right, I find this also. We could think of it as, we allow our narrow attentional focus, or subset of the world-pattern, to open up, and our sphere of presence (the subset of the possibilities we allow to contribute to our ongoing experience) then incorporates all those fresh patterns and apparent interactions. When we loosen our hold on our experience this way, the world does often become more dreamlike, because we aren't gripping onto it with our habits and assumptions so much, we aren't intending in terms of our world views so much. Creativity in action! :-)

The Hall of Records

Imagine that you are a conscious being exploring a Hall of Records for this world.

You are connecting to a vast memory bank containing all the possible events, from all the possible perspectives, that might have happened in a world like this. Like navigating through an experiential library. Each "experience" is a 3D sensory moment, from the perspective of being-a-person, in a particular situation.

And there may be any number of customers perusing the records. So this is not solipsism: Time being meaningless in such a structure, we might say that "eventually" all records will be looked-through, and so there is always consciousness experiencing the other perspectives in a scene. At the same time, this allows for a complex world-sharing model where influence is permitted, because "influencing events" simply means navigating from one 3D sensory record to another, in alignment with one's intention.

This process of navigation could be called remembering. Practically, this would involve summoning part of a record in consciousness and having it auto-complete by association. This would be called recall. You can observe something like this "patterned unfolding" occurring in your direct conscious experience right now.

So in terms of "oneirosophy" you don't need to worry about another "you". You are not even the person you are experiencing, you are simply looking at this particular series of event-memories, from this particular perspective. "Intending" changes in your experience means to decide to recall a memory that is not directly connected to this one.

Note that none of this metaphorical stuff is necessarily required though - all that matters is that you are willing to let go of the current experience, and believe that you can connect to another experience which is discontinuous with it. However, these "Active Metaphors" better allow you to format yourself.

you see my body is not illusion otherwise i couldn't exist, even though the cause is imaginative and the only solution i have is to manifest mushrooms - and by manifest i mean have success in growing

Well, your body is an illusion in the sense that it is not what you might have assumed it to be. Being an illusion doesn't mean something doesn't exist - it just means our description of its nature is incorrect. In this case, the body is realised to be an experience shaped from awareness, rather than an independent external object which is being observed by a separate conscious viewer. It's an illusion in the same way that a photograph of a crowd scene is not actually a bunch of people wandering about on a street.

Other people's bodies are of the same form as yours: sensations and perceptions arising within and as you-as-awareness. Your body is just a bunch of sensations plus an idea; you don't really have a body as such. And other people's bodies are basically just visual images, sounds, and textures, just like everything else.

Note: if when you think of other people's bodies, you are thinking about them as if you were "in" those bodies, or are viewing them from a 3d-person perspective (the "view from nowhere"), then you are immediately "wrong" - because what you are doing is imagining that you-as-awareness had taken on the shape of a different experience. On the other hand, upon recognising this, you are "right", since you realise that there are no "other people" as such, except as patterns of experience, and that is what "you-as-person" is also.

so it's their fact of them existing in my presence that i'm concerned about

I'm not sure what you mean by "existing in my presence"? Firstly, what do you mean by "my presence" and then what would it mean to "exist" in that?

Q: *Firstly, what do you mean by "my presence" anyone i see what would it mean to "exist" in that? be seen by me but my presence itself is the totality of awareness localized to a particular experience, as in brahma [infinite grid], paramātmā [localized experience] and bhagavān ["my" experience as 'śrī kṛṣṇa']*

I meant more what your presence actually is - but going along with that: when you see "someone" what is it, exactly, that you see? What exactly are you experiencing?

i'm experiencing an experience - albeit one i don't care for

...So, putting aside any interpretation based on mushrooms or contemplation or anything else, you end up with: you are having an experience of sight-sound-texture-feeling, with nothing "behind" that. You are experiencing an experience; you are experiencing being an experience.

Given this, what are "other people"?

other people must be myself

And what are you?

parāvara - totality - the universe - everything

Even that, though, is perhaps a little grand and over-reaching, referencing ideas that are not themselves persistent (although I do get that they are metaphorical and trying to "point the way" rather than capture its essence). So -

I'd suggest keeping it simple and phrasing it as something like:

- "What you truly are is 'that which takes on the shape of experiences'."

Or just "that which experiences", but I think it's useful to go with the formulation above, since it emphasises that there are not two things - the experience and the experiencer - only one thing (really: no things). And that is the only thing that is always true: the only fundamental truth. Beyond that, things are changeable and are only relatively true.

how would you encapsulate that in a word?

I think I would probably deliberate not do so, since it that word and its conceptual associations would become yet another distraction. If I had to go with one, I'd opt for: "this".

Of course, this (ahem) only makes sense once you have already worked through everything, but that's fine. It's really a recognition that no word can mean what we are talking about here, since what we are talking about here is that from which all meaning is made. (And we're back to the metaphor of no sandcastle being able to capture "the beach" and "sand", while also being both of those things.)

POST: The depths of the skeptical mind.

[POST]

I thought i would share this experience while it's still fresh in my head because i am still baffled by the oddness of it. I was having a dream that i was walking around my neighborhood, and i realized i don't remember how i got here. I thought to myself, is this is a dream? It feels pretty real right now. So i decided to see if i could levitate and sure enough i could. I levitated a good 20-50 feet or so up into a tree and decided to stay up there. On a nearby branch in like a birds nest or something there was a black flask nearby. Curious in this state i decided to see if this liquor would give me a buzz. But just before i began to drink this voice out of nowhere came into my head and was like "dont drink out of that it might be poison, you cant be totally sure whether or not we are awake right now". And i'm like REALLY MIND? ARE YOU FUCKING KIDDING ME? I just levitated 20 feet up into a tree and you are still doubtful as to whether or not this is a dream. But i have had other occurrences like this as well, like if im pretty sure im in a lucid dream and i want to strip off my clothes, sometimes ill get this sense of "this might not be a dream, you don't want to get arrested". But there was still some legitimate doubt as i didn't do any levitating or nothing before hand, it was just a strong feeling that i was in a dream. But after levitating and having that voice go in, it really made me realize the lengths the skeptical mind will go to try to cling on to a materialist worldview. Maybe it has to do with the human part that wants to retain its survival, and maybe that has to do with that fear of dissolving boundaries and the comfort of consensus. This experience also shedded light on why materialists can take hard psychedelics and still remain materialists afterwards, the skeptical mind can always find excuses because skepticism can destroy any idea in ones mind because it is a kind of weapon, but the problem is that it can disprove truths as well as falsehoods if applied too liberally. anyway, that's all i have to say for now.

[END OF POST]

This experience also shedded light on why materialists can take hard psychedelics and still remain materialists afterwards, the skeptical mind can always find excuses because skepticism can destroy any idea in ones mind because it is a kind of weapon, but the problem is that it can disprove truths as well as falsehoods if applied too liberally.

One of the major problems is that people literally and directly experience their viewpoints as true. The concepts and beliefs you hold actively shape your experiences, because they "snap to" the subtle structures of your/the mind, which then further embeds those viewpoints in a feedback loop (like this).

If you believe materialism (or just assume it, unwittingly - belief is not a choice usually) then you'll experience that as your truth. Things that don't fit in with it either won't be noticed, or will be explained away, or quickly forgotten. Only aspects which fit in with your established concepts seem to be clear and in focus.

On the upside, once you are introduced to new ideas and entertain them a little bit, those ideas will infect your experience and you will have confirmation of them. However, any doubt at all will revert you back to your previous, more established worldview - in much the way you describe. "Hey, I'm levitating! But, y'know, better watch out I don't get arrested for being too noisy in this quiet neighbourhood."

I cannot fully understand how you reached the conclusion about scepticism destroying any idea from materialists being materialists (and I see that as a bit of generalization, I mean do you know what's in their mind?). Also what I saw in your dream was a subconsciousness trying to protect you. Any connection with what's happening in you waking life? Note: Thanks for sharing these thoughts. It means that it made a great impact to you. This is why the bigger the impact the bigger the "cruelty" of the other point of view it needs. Or I am just being a skeptic ;)

What is that subconsciousness do you think?

just his inner self

And where is that?

it's part of him. I feel a circle coming up.

Me too :-)

So, where is he?

I am afraid I don't know his address...

No. 1 Infinite Street, Everywhere City, Entirety NA.

Does that mean that I can visit him even from my sofa under my bed cover or does it mean that I am himself as well?

Yes and no.

Both he and you live at the same address, always, although you suffer from the illusion that you occupy different rooms.

POST: Minimalism and Renunciation.

[POST]

Every state of mind has its costs and its benefits. The human state of mind, the humaning game, has its benefits. You get the experience of striving as a human with seemingly real pressures and potentially get the rewards and joys that success in the human world has to offer – love, sex, art/media, science, tasty food, drugs, communication with other free beings, etc. However, in order to have these experiences and to have them seem real, certain sacrifices had to be made. You had to trick yourself into believing that you were powerless over the vast majority of reality. That you can only influence reality indirectly via pulling the puppet strings of your body. That the body could make very real demands upon you. Etc. If you want to have human experiences, then you will want to keep the cognitive structure that generates the human world. The cognitive structure is the tool you use to have the pleasant conventional experiences that you seek (at the cost of the unpleasant conventional experiences you flee from).

If your imagination remains limited to casting for sex, money, a better job, human status etc. with your magick, then you probably won't be interested in what I have to say. However, if your aspirations range from lucidity to telepathy and telekinesis to deification, then what I have to say may be of interest to you. All of the latter values require an abandonment of your humanity in some way. What do I mean? Humans aren't telepathic or telekinetic - this violates the human idea of an external world that you and other beings interact with only through your limited bodies. You're going to have to start thinking about the metaphysics of other people's minds and the physical world differently as well as the relationship your mind has to those minds and that world. Thinking in these other ways is indicative of insanity in the conventional world, because you're supposed to be an ordinary human. If you could read and influence the minds of others, where is the boundary between their mind and your mind? Similarly, if you could influence a physical object, where is the boundary between your mind and the object? How could there be other people, a physical world, or even a 'you' in the limited sense you're used to thinking about yourself? These are inhuman questions, and they eventually result in a total abandonment of the cognitive metaphysical structures that keep the human world in balance (e.g. strict laws of physics, strict self v. other), which is what then allows for your magical influence. Even if you successfully develop some psychic power by changing your cognition of reality somewhat, as long as you desire the things that require a conventional, human frame of mind, your powers will never move beyond simple magick tricks that make your human life a little easier - tricks that can be written off as coincidence or as potentially explicable by physicalist science in the future. The reason is very simple. Even if you've learned how to leave humanity and live in new realms, if you are committed to, attached to, and desire mundane things then the idea of permanently abandoning Earth for these other planes of existence will be deeply disconcerting. You'd eventually return to Earth (or something like it) and thoughtlessly reenter the human realm as you focus on attaining material desires with your limited body, rather than expanding your psychic powers and chasing after things that don't require active self-limitation and lead to self-forgetfulness. What I'm saying is that your human attachments are the chains that bind you to this world. Human ambitions allow very little room for direct influence by your will. A being with god-like powers would eventually find itself in our position if it had strong desires for these human experiences that require self-limitation. After a period of restraint, even the memory of one's old abilities disappears. Worldly cravings will weaken your paranormal abilities and subject you to the suffering of the human world. Thus, the stronger your rejection of things that require a human frame of mind, the stronger your magick can become.

To become a Lord Mage, you must renounce your humanity. There are many facets of the abandonment of your humanity. I think most of it can be summed up in terms of status, possessions, and the body. Status. I think icons of status are relatively obvious. Icons of wealth, of attractiveness, of membership in certain social groups, of image, etc. These earn you all the perks a conventional life has to offer - you get the most play and the least work and the most respect by other humans. These demonstrate your success at humaning and range from sex, money, cars, clothing, ornamentation, homes, precious metals, art... Possessions and the possessive mindset. The whole idea of material things belonging to individuals. Respecting the concept of material possessions and thinking of objects in terms of mine and not mine. Having a responsibility to maintain those possessions to use to your worldly ends (you've got to keep the house in good condition, the car, the electric razor, the lawn mower, the computer, the books, the driver's license, etc etc etc) and protecting them from damage by environmental conditions or by other individuals seeking to disrespect the possessive mindset and “steal” your stuff. Possessions are mostly either status/image symbols, are directly depended upon for pleasure, or serve a functional purpose in maintaining your life and hobbies in the world. The body is the tool of action and expression in a world like this. The body seemingly has certain needs for it to be in ideal useful condition. Grooming, hygiene, food, water, breathing, sickness and healing, pain and injuries, medicine, the 5 sensations, heat and cold protection, etc I think that the more you start to abandon status, the easier it is to relax possessions. As you relax your hold on possessions and status, it becomes easier to relax your hold on the body. It also works the other way. So, in a way these three are connected. I could talk a lot about the details about what symbols of status and possessions rule your lives and how they can all be easily overcome if you decide to, but I think each of you knows for yourself where you're at in that process and what needs to be worked on. Also, you can learn not just tolerance to social rejection or non-possessiveness. You can learn total tolerance to non-eating, to non-sleeping, to cold and heat, to sickness, to pain, to disembodied states, to astral realities, etc. These are the abilities that will really help you break away from the human world - that will one day help you cope with humaning withdrawal symptoms. But these tolerance take time. Besides being annoying addictions on their own, status and possessions take up time that could be used on developing one's magickal powers, developing lucidity, or attaining liberation. Hell, even if you don't want to devote all your time to multi-life concerns, status and possessions take up time that could be used for adventures and exploration and travel in this life.

As for me, I am only holding onto a show of status until my student loans are paid off (hopefully in three years if my plans work out). Then, I intend to live in a van and work on giving up possessions and learning to live ultra-minimally until I can live with only a backpack of stuff and travel and live like that. After that, there are so many options that I have considered. It is incredible. I expect my life will be a mix of travel, adventure, and spiritual practice after that. I imagine the characters I liked and most wanted to be when I watched TV and played RPGs - unattached adventurers. That seems like a good place to get to for now and to then learn so much more about myself, my powers, and my world. I decided to eventually move into a van quite a while ago. Recently, I became confident that I could eventually give even that up. And then I realized I might be able to go further than I'd considered after I read about an individual who isn't part of a religious order who hasn't used money in any way in over 10 years. While he in some ways still identifies as a conventional human, he's managed to abandon possessions and money in a way that I've only heard of in ancient religious texts. <https://sites.google.com/site/livingwithoutmoney/> I don't know about you all, but I find this to be an inspiration.

So what do you think of all of this? How do you relate to what I've posted here? What are your spiritual plans and your plans for your human life? How focused are you on renunciation v. other practices? What do you believe and what are your values?

[END OF POST]

What, no yachts then? ;-)

- Experiences

I can relate to much of this, and have experimented a little at both ends (being rich and being less so, being status-heavy and not). I've also experimented with letting "TriumphantGeorge" be moved by the background flow of consciousness, and at other times taking direct control of "TriumphantGeorge".

For me, life is about experiences. It can be fun to experience having a Ferrari in the garage, for instance, so long as you don't think you own an "object". What you "have" isn't made of "matter", it is made of "eyes and fingers". In other words, what you have is access to a certain experience without latency.

- Destruction and Emergence

It's relatively easy to switch to an impersonal experience: Just change the context of your attention to be the open, dark, silent, present, thought-free background upon which the patterns of experience arise. As you say, though, I think it can take some time for the structures that have accumulated - become enfolded into your conscious space - to dissolve. You can do this with an "overwriting" exercise, to bring your daily experience closer to transparency. This aim surely isn't necessarily to remove those experiences, but rather to no longer be bound to them.

When I read of some people's efforts in this direction, I've sometimes thought that maybe: It is perhaps a mistake to confuse destroying your current experience, with becoming non-attached to it. The former doesn't lead to the latter, necessarily, and is not even required for the latter. In other words: Just by lying down each day and releasing our hold, the apparent world will naturally realign to our true nature. No grand physical acts of renunciation required.

I still think there's nothing wrong with yachts, so long as you understand what they are. :-)

- Maximum Power!

If you really want full power, right now - basically, a reset - then suicide while persisting attention on the background is probably the way to go. Followed by something like the "sparkles" method for OBEs. Since you get that experience in the end anyway though, I never saw the hurry.

If you do the man-in-a-van thing, or the wandering nomad, what do you think is going to be cooler about it? Not a challenge, just interested. I find it totally fascinating. I'm not sure that you have to zero-out your current 'dream contents' to have everything you want though, but maybe it can make it come quicker?

...

Great response, thanks.

Of course having a Ferrari can be fun. But there are two things that come with having a Ferrari.

I agree with where you're coming from in general. That's why I say that usually we are seeking experiences rather than status. Because status experiences, such as "ownership", are conceptual, and often come with additional experiences that aren't desirable.

Ferraris: My answer generally is that you wouldn't want to experience ownership at all, unless you had so much money that it didn't matter. Rather, the experience you want is using a Ferrari when you want it (and not having one when you don't), so surely you'd just "wish" for some sort of arrangement that gives you just that.

Aside: I used to live in an apartment block where a few people had expensive, high performance cars in the basement garage. They'd take them out for a spin periodically. Thing is, those cars aren't designed that way; they need to be constantly run and tuned, and kept in decent environments. Almost every time those guys took them out, they'd have to get the car jumped into motion, or it would have some sort of problem while they were taking their girlfriend on a trip to show off to her parents, or it'd have to be off for retuning before the trip. To be a member of a car club would make much more sense for these people - ah, but then they wouldn't have the "status" of "ownership".

This maybe fits more with what you're saying.

But... why not use magick to have Ferraris and yachts and a cool house and them not to have onerous obligations? Why not use magick to have an income stream that doesn't have burdens attached?

Perhaps... you are not being ambitious enough? ;-)

That's the thing. I see problems and conflicts between my present lifestyle and my future ambitions...

Basically, to be free of the influence of external powers (and internal powers).

I can visit... hermits (if they want to chat for a bit)

Can I just say, separately, that this is a fantastic line! :-)

Anyway, you've answered my next question which is: you seem to be focused on freedom-from rather than freedom-to. In my experience, the former takes care of itself, if you concentrate on the latter. (Magick works best by somewhat ignoring your present circumstances, and concentrating on the circumstances you desire?)

You have a student loan. Are you using magick to 'delete' that yet? Or are you going to slog through the three years?

That vs. sleeping in the same room in the same house with the same neighbors for several years, staring at screens, working for some jackass boss for the bulk of my life, having to deal with conventional humans's ignorant bullshit all the time, etc.

Thing is, in my viewpoint, you don't need to physically do anything about "human's ignorant bullshit"; it only impinges on your life to the extent you focus upon it. Like a dream where you fixate on something, then re-focus and it dissolves into the background. It was never really "there" anyway. You were just experiencing your own conceptual momentum rendered into apparent objects. Personally, I'd least go for a Matthew McConaughey-style Airstream existence. :-)

[QUOTE]

“All your life, all your love, all your hate, all your memory, all your pain. It was all the same thing. It was all the same dream that you had inside a locked room. That dream about being a person. And like a lot of dreams , there is a monster at the end of it.”
— Rust Cohle [Matthew McConaughey], True Detective (HBO)

[END OF QUOTE]

Yeah, but I have this huge commitment and attachment to the material/external world. There are other people. There is a world. And my conception is that they are relatively static and fixed, though the rules can be bent a little. This is what I presently believe. If I believed that this world was a dream deep in my bones, then I would destroy it and build a different one. Ordinary people treat each other and myself like shit, and they are generally ignorant fools. Problem is, I'm still dependent on this body and I'm currently deeply dependent on them to take care of my body. Thus, I have to deal with their shit all the time. It feels like 70% of my life is consumed by my human job, my human interactions that are necessary to get what I need from people, my human chores, etc.

So much of this perhaps results from your current ongoing attachment to the material world, while your ambition is to be unattached to this, as a way of realising your potential as God. However, becoming God will be a case of recognition, not becoming. If you are not God now, you can't become God. So your path is about reaching this conclusion and accepting it, surely. All the rest - Ferraris, money, desires - doesn't really matter much, just images in consciousness. They're here because, as God, you have implicitly created them. And your sense of limitation, the same. I think you might just be putting off the inevitable. How are you going to transition?

I repeat: **If you are ever going to be God, then it must already be so**, simply concealed from you, by You. You must in fact already be the whole world, and not just /u/AesirAnatman. There are no other people, and no /u/AesirAnatman, except as fragments of You.

As has been said elsewhere, **the truth is that you are a vast space of consciousness**, in which all experience - this world - arises. The content of this space is a direct result of your intention. All content - thought, body sensation and movement, surrounding landscape - is a response to the momentum of your intentions. For as long as you act based upon the assumptions and concepts of a material world of limitation, your results will occur bound to those assumptions and concepts. But really, **you are already free**. When you do get around to destroying the world, building a different one, how will it differ? (Given that your current world is like it is, because you are like you are: it is a reflection of you.)

What I want is to become conscious of my manifestation of the apparently external world and reclaim control over it in the same way that I am conscious of and control my manifestation of my body and thoughts.

Got ya. The thing is, as you point out later, you don't usually directly control even your body and thoughts; there is already the momentum of previous intentions. Rather you 'amend the direction' that things are going in. The larger world within you has the same problem: habits have been established, have momentum/inertia, so these days very few manifestations seem 'direct'.

I agree with you. But I am not conscious of my intentions. I don't pay attention to them and am deeply habituated along certain mental pathways.

Yeah. It's a major difficulty, actually. You usually can't be aware of your intentions, because they are first-cause, you can only infer them. Even if you intend deliberately, what's actually happening is that you're experiencing a result, the "deliberately"; the intention already occurred.

That's why people tend to work on their assumptions and beliefs, on deleting the 'structure' they have accumulated. "Eliminating habituation", you said nicely. Or hold on to a "feeling" that corresponds to their desire, so that experience falls in line.

Magick would be a much more common power – similar to the Force, except more powerful and somewhat more common. That's some of what I would do if I were able to consciously reconstruct reality, at least at first.

I think magick must have been more common in "the past". Our shift over the last few hundred years has been dramatic. Once people imagine the world to be a certain, other way, it tends to behave accordingly, annoyingly.

"Release all your desires from the internal, so that they are forced to manifest in the external", is an approach I've been playing with.

The problem of commitments and habits is a secondary problem. The primary problem is ignorance.

I see those as the same hurdle to overcome? You are right that we "ignore... the vast majority of our being". We attend to the surface appearances, "the show", and forget the script, the internal from which the world is "pushed out" into the external.

On intentions: I think you infer your intentions from the thoughts and events that occur to you. But then, having realised where things are going, you can redirect?

That's why people tend to work on their assumptions and beliefs, on deleting the 'structure' they have accumulated. "Eliminating habituation", you said nicely. Or hold on to a "feeling" that corresponds to their desire, so that experience falls in line. Can you explain more?

Coincidentally, I was just having a conversation earlier, see here [*POST: Continuity (/r/Psychonauts)*].

Experiences leave traces which influence other experiences, and so on. Uninterrupted, your world (internal and external) deterministically unfolds in whichever direction its going, in alignment with your enfolded beliefs and expectations. Unless you update those beliefs and expectations.

How do we do this, how do we detect it? If your experience is a result of your 'enfolded structure', then you can't experience it directly. But, your "feeling of how things are", your "felt sense" does contain this. It's like a global summary of the structure of your world.

To change the direction of your experience, you must change the underlying structure, which you do by asserting new facts, and having them felt to be true. Subsequent content will then fall in line. (The content of your experience is transparent and illusory, what you do with that simply doesn't matter.)

EDIT: I still struggle with wording this "intention" stuff well. So, please indulge my attempt and bounce back so I can clarify, get my thinking better on it!

Maybe some intentions are inferred. But I think many are directly recognized. For example, if I start paying attention I notice that my body is sitting right now - thus, it is my intention to manifest my body as sitting. My body is typing at the computer in response to your comment - thus, it is my intention to manifest a response to your comment.

I'm not so sure about this. I think that there is a "momentum" to events, to thoughts and actions and the environment, that continues deterministically until we use our "free will" to interfere are redirect it. At which point it becomes a deterministic chain pointing in a new direction.

Further, it was my unconscious intention to be bouncing my leg, but when I noticed/realized what I was doing, I was able to decide/intend to keep my leg still.

I'd have that as an example of interfering, but perhaps not even. This just happened automatically as a set of experiences one after the other. Your attention spontaneously moved to your bouncing leg, which then stopped, and your attention moved again... and so on.

Would you provide an example of how intentions could be inferred?

In the same way as character. Your idea of who someone is, is a bundle of experiences of that person, from which you infer what that person "is like".

Intention - as "first cause" - is a movement or reshaping of consciousness of itself, by itself. Like a blanket folding itself, or a pool of water rippling itself. You cannot find the "cause" of the fold or the ripple, only the "results": the folds and the ripple. You infer that the folds or ripples were "intended", but you cannot find the "action" that led to the "result", because they are the same.

One the "first cause" has happened, the ripples continue in a deterministic fashion, the pattern propagates automatically, until another ripple is created by "first cause", and so on. In this case, we don't "intend" everything we appear to do - all those appearance are result, patterns in consciousness. Those results could be called our "intention" (as in, what we meant to happen), but the intending itself is occasional, and cannot be experienced. Some people never intend. They are born, and they just play our in alignment with their initial nature or direction. Others constantly interfere, suppressing the spontaneous movements and responses and become disconnected and separate, internal vs external. The happy balance is to occasionally decide what you want to happen, and intend it (by declaration/acceptance or a variation there of), and then let things be.

Note: If you have a thought "I will do this" or "this will happen" and then the action occurs, the thought didn't cause the action; the thought isn't the intending. It's just another result.

TL;DR: "Intending" is a particular thing, consciousness changing itself. It is not the same as an action.

Ok, I understand. Deciding to manifest new beliefs and thus altering reality according to our will. Magick.

Yep, basically. You can "insert a belief/fact" that a particular event will happen, or you can "insert a belief/fact" that is more general, that the world now 'works a certain way' from now on.

I've come to think, though, that the best approach is first to absolutely let go of all control, of all hold on yourself and the environment. To accept everything just as it is, as an experience, with no backing or belief structure. From there, with a minimum of "enfolded forms", your assertions can take maximum effect, because they are no longer filtered in the same way.

Give it all up, to get it all.

Which a few texts make reference to actually: let everything go, to gain everything; destroy yourself to gain the universe; the meek shall inherit the Earth.

I think that momentum isn't objectively out there. We believe that the mind has a sort of momentum, and so it manifests that way.

Yes, I agree with this. The problem is where we draw the line, for convenience, when describing this. Will try to pin it down a bit more later.

I think it is possible to manifest a reality with no habit, with no momentum. Instantaneously manifesting every new whim and impulse regardless of what was manifested previously.

I think this is indeed possible, and as we relieve ourselves of what I will call "enfolded structure" then more things can happen and by more direct narrative routes (or even no route at all).

Hmm. I don't think like this. I think everyone is always intending, but in different ways. Some people are mostly creatures of habit, living out the same basic lifestyles they have lived for many lifetimes.

So, this is where we need to clear things up. We probably don't differ, but we are using "intending" and "deciding" and "momentum" differently. I probably mean something more like "redirecting". Let me try and paint a picture and we'll see. I'll begin without using those words, and then try to reach definitions by the end.

Please excuse length!

The Experiential Mind-Space: Implicate & Explicate, Enfolding & Unfolding

1. The Structure of Experience

I'm going to assert that the structure of personal experience is something like this diagram.

Fig 1. An illustration of the relationship between enfolded forms (belief, expectation, memory traces) and unfolding experience. In an ongoing feedback process, experiences leave traces which then in-form the structure of subsequent experiences, as spatial and temporal structures - i.e. objects and narrative, respectively. To change the nature of experience requires exposure of the ground to alternative types of experience ("external" change) or a shifting of the form of the ground directly ("internal" or first-cause change).

We have an open 'mind-space' in which our experiences arise. Experiences leave traces, "structure" enfolded into the background, and that affects subsequent experiences, which tend to unfold by "snapping to" the pre-existing traces, and so on.

. . . unfolded experience (explicate) > enfolded traces (implicate) > unfolded experience (explicate) > . . .

So we have an "implicate" level (containing enfolded forms) and an "explicate" level (the unfolded objects you are experiencing at that moment).

At this point in the description we are completely passive. Experiences are simply happening to us, and over time the memory-traces are funnelling subsequent experiences into a stable form: call it "habits" or "regularities" or "laws" or whatever. Also, these correspond to "beliefs" and "expectations" and even "facts" - the same thing!

If the universe began with random noise, gradually it would evolve into a structured environment. The way dreams start, from hypnogogic sparkles and imagery, is like this. A while world is formed by itself without input.

(By experiences, I mean both sensory and thought, they're the same, and both leave traces in the implicate order. They differ only intensity. I'll pick up on that later.)

2. Momentum and Intention

What I've called conceptual momentum is basically just the fact that, left alone, patterns of experience become more and more established and have greater influence.

When I talk of "intention" what I mean is the decision to directly interrupt this process and redirect it. Of course, you might say that not interfering is itself an intention, but I want to be more specific about the term. Intention is the act of deliberately changing the enfolded structure of the "implicate" level. Having made these changes, the experiences that unfold at the "explicate" level will afterwards be aligned with the new "facts of the world". We cannot affect the unfolded objects of the present moment directly - they are just mirages, completely transparent and without substance. All change must happen at the enfolded level.

The changes made to the implicate level might involve the insertion of a single event ("this will happen tomorrow") or a new state ("this is now true") or a new relationship ("thinking this means that this action will follow") or broader rule ("this always happens") or statement of identity ("I am like this").

However, in all cases we are simply changing the shape of the 'sand dunes' upon which the 'mirages' are formed.

3. The Mechanism of Change

The key to this is that there is only one mind-space. So just as spontaneous sensory experiences leave traces which affect future experience, so thought leaves traces which affect future experience.

Thinking of a particular image will tend to result in experience following those images, etc. However, this is not very powerful. What you want to do is change the 'global' structure at the implicate level, not just create particular instances. This is done by the additional sense: our "feel" of the world, our "direct knowing".

By creating the feeling of something being true, we adjust our enfolded structures to correspond to that fact. All magick - visualisation, ritual, etc - is simply an indirect way of generating that 'feeling of truth'. However, it can be done directly.

What "intention" really is, in fact, is the raw summoning of that "feeling of truth", of shifting your implicate structure directly into a new state that corresponds to the world you want to live in.

4. Overwriting Yourself with Empty Space

Finally, this leads to one of my favourite exercises. What we really want to do is open ourselves out from habitual paths of experience so that more things are possible, by the quickest route (or no route: instant manifestation). How to do, given the above?

Basically, we want to overwrite our enfolded structures, our implicate level, with open unstructured space - complete possibility. We do this by literally switching our focus to the background awareness, and asserting as fact and adopting the shape of no structure, of 'dream', of open space.

When we do this, we feel the 'push back' of existing structures. It is tempting to use effort to push through this, but that's a mistake. It's not actually 'push back' you are experiencing; rather you're just becoming more aware of the existing structures. Asserting something makes you intensely aware of the contrast between your current beliefs and the fact you are asserting. Persist, and the enfolded traces will dissolve; the implicate order will move towards the shape you are intending.

I think everyone is always intending, but in different ways.

I know what you mean by that. By my formulation above, I'd say that people are implicitly choosing to remain the same by not "redirecting" their path, because they don't update their "enfolded schema" as I've described. They are not actively intending therefore. Or worse: they are affecting it unwittingly by generating thoughts from ignorance! Mostly though, everyone is just experiencing the unfolding of their current direction, forever unadjusted.

Okay, that's my best attempt at describing my thinking so far. Keen for any input or disagreement, alternatives!

EDIT: Minor grammar tweaks, clarification of wording.

I believe it's possible to manifest in a way that doesn't create any habits.

I do too. By using absolutely no effort, we leave no traces. How to do this? Edit the structure of the implicate level, with no attempted forcing of the explicate.

Also, I don't think there's a sharp division between beliefs and experiences. That is, I'm not convinced there's a sharp division between the implicate level and the explicate level.

There isn't. In reality, they are single swirling intertwined process, like waves bouncing off waves. The explicate and implicate are both just patterns in consciousness, but the implicate level is the "timeless level" whereas the explicate level is the "unfolded now".

EDIT: And you are experiencing your beliefs directly all the time in terms of a subtle "background knowing-feeling". The ongoing sensory moment is really a shape-changing time-based aspect of time-less belief: they are really all one pattern.

I don't use the word intention the way you use it here because the implication is that relaxation is non-intentional

Because my definition is that "any change from the way things are going is an intentional act", that's not a problem for me. But in fact, you can find yourself going to lie down and relax, and it wasn't deliberately intended - in the sense that is just flowed from your current momentum. Everything that happens and everything you do is always just flowing from your current momentum. Unless you are constantly re-intending. Which would be a sign of a lack of faith, really.

what I was saying above about being able to manifest without creating habits or immediately drop all forms of conceptual momentum if I choose.

If you manifest by insert single-event facts into the implicate level (i.e. declare a truth, make a change at the non-sensory level) then you are not creating habits - you are "amending the blueprint" directly. So, you might think there'd be two ways to change a habit. If you keep performing an action, that will change a habit by gradually leaving a trace. Alternatively, you can reach into the structure of habits itself, and change it directly. Magick is about the latter.

EDIT: Can we avoid creating traces simply by deciding not to; by remaining in a "dropped, open state" at all times?

I think the manifestation of all of our beliefs (felt truths?), whether new or old, is intentional. But, I understand how your use of the word works in the perspective you have outlined here.

There's no good word really. The essence is "things continue in the direction they are going, in accordance with established habits, unless you use Will to edit your implicate level". You can say that all things that subsequently arise from a change in direction are "intentional" in that you chose the direction, but that's not how I've been using the word.

"Mostly though, everyone is just experiencing the unfolding of their current direction, forever unadjusted."
I don't like the way this and the whole deterministic language sounds. I think that people are living freely in the context of freely adopted commitments and habits.

This is where we differ, and I think it's very important to the idealist/non-dual/dream-like worldview. Once things are rolling in a certain direction, then your experience is deterministic. You are however free to intervene and redirect at any time, but often you won't. You will "have the experience of making choices" but you won't really be actively interfering in their occurrence. They "choose" how to practice, but really they are just acting consistently with their current direction.

They no more "choose" than they choose the beating of their heart and the flow of their blood and the growth of their fingernails. It's all happening from and in alignment with their "enfolding schema" at the implicate level. Acting consistently with one's Current Nature isn't a choice. The only true free will we have is to change our nature, and to stop interfering all the time (if we do that).

Neville Goddard had a stab at a similar world view. Just to give air to another way of wording it, here's a bit of cut-and-paste of the relevant passage in one of his books:

MANY persons, myself included, have observed events before they occurred; that is, before they occurred in this world of three dimensions. Since man can observe an event before it occurs in the three dimensions of space, life on earth must proceed according to plan, and this plan must exist elsewhere in another dimension and be slowly moving through our space.
If the occurring events were not in this world when they were observed, then, to be perfectly logical, they must have been out of this world. And whatever is there to be seen before it occurs here must be "Predetermined" from the point of view of man awake in a three-dimensional world.
Thus the question arises: "Are we able to alter our future?"
My object in writing these pages is to indicate possibilities inherent in man, to show that man can alter his future; but, thus altered, it forms again a deterministic sequence starting from the point of interference—a future that will be consistent with the alteration. The most remarkable feature of man's future is its flexibility. It is determined by his attitudes rather than by his acts. The cornerstone on which all things are based is man's concept of himself. He acts as he does and has the experiences that he does, because his concept of himself is what it is, and for no other reason. Had he a different concept of self, he would act differently.
A change of concept of self automatically alters his future: and a change in any term of his future series of experiences reciprocally alters his concept of self. Man's assumptions which he regards as insignificant produce effects that are considerable; therefore man should revise his estimate of an assumption, and recognize its creative power.
All changes take place in consciousness. The future, although prepared in every detail in advance, has several outcomes. At every moment of our lives we have before us the choice of which of several futures we will choose.
— Excerpt from Out of this World, Neville Goddard

EDIT: Ever played with tulpas? I haven't , but this post was an interesting attempt do discuss "realness" while faltering on the subjective/objective bit: private truth vs public truth?

This is a tricky topic, and I'll try my best to not dance about it. In order to give a sufficient answer, we have to pull in a few premises.
First: Reality is subjective.

Each and every person has control over their definition of what is real and what is not. This is not to say that there doesn't exist some kind of publicly-observable universe; rather, I am saying that each person has control over their perception of what they say, they feel is real or not. These feelings have a special term; they are called qualia, and they are the mental representation of the sensations, from the most physically founded (such as "hot" or "cold") to the most symbolic (such as "weird" or "nice"). I posit that reality is defined by some form of qualia, some attribute of realness, that makes certain concepts (including, but not limited to, perceptual concepts) seem real. That is to say, you and you alone have control over what you find to be real.
Second: Truth is subjective.

What does it take for one to find something to be true or not true? Well, in the same way there is a qualia for reality, some property of realness, I posit that there's also a qualia/property of truth. In this case, we have a convenient name for the things that are assigned this quality: belief. In many communities, including scientific ones, belief has become a "dirty word" meaning something that is taken to be true without proper evidence or support, but in the way I use it, I intend it only to mean the things taken to be true (regardless of how they've come to be regarded as such).
(Note that I am not denying that there is probably also an objective, public truth, which both science and philosophy strive to find, but it is necessary for us to think of truths as categories of concepts, the representations, and not necessarily the referents of said concepts.)
Since belief is sufficient to establish a subjective truth, it follows that, if you believe something is real, it is real--to you. This is not to say that someone else cannot come about and deny that it is real, but, since this is your mind, you are the only person you need to prove the reality of anything to (in these cases).
The most tempting counter-argument would seem to be Russel's Teapot--if I were to claim that there were a teapot somewhere in orbit about the sun between the orbits of Earth and Mars, the burden would be on me to prove it--even if I evasively claim that such a teapot can't be observed at present (for any particular reason). However, the existence of the teapot is a public truth, a truth that, if it were taken to be true, would affect everyone's experience, and not just that of the claimant (myself, in my wording). If I sincerely believed, without doubt, that there was indeed a dark-matter orbitting teapot, then that would be how it is with me, and I would find no fault in seeing it as true. (If I were so inclined, I might even look oddly upon those who didn't find such a teapot there.)
Again, we're dealing with the mind, not the universe. This is an odd realm where existences can be summoned by mere thought, where the rules of logic don't apply (where you can conceptualize the statement that is true and not true at the same time--there, you just thought of it), and where the law of the land is laid by belief, oriented by, and affecting, perception.
So, what of tulpae? What of these sentient "imaginary" friends? I could not expect you to believe, without any evidence, that I'm talked to by a stuffed snake, with whom I carry out my discourse. I have established, with my logic, that the mere act of believing that he is a sentient, independent being, is sufficient to make him a sentient,

independent being in my subjective truth, but is he?

This is where science would indeed be useful, but it finds difficulty in exploring these areas. Let's start with a small exercise; don't skip to the end until you've performed the step you've read. It's really quite simple: 1. Think of someone you know fairly well; it doesn't matter who (friends, family, distant relatives, co-workers, etc.) 2. Think of what would happen if you encountered that person (wherever they would normally be) and asked them if they liked your hair. Could you think of the way they would react? Congratulations, you have predicted their behavior.

Now, here's the kicker: to whom did you direct the question?

In reality, the question doesn't matter. The environment doesn't matter. Your choice of person doesn't matter, aside from the fact that it has to be someone you know well. You possess some concept, some model of their behavior that you used to predict how they would react to that environment. I call such a conceptual entity a simulant.

For the sake of brevity, I'll wrap this up. I hold that tulpae are simulants--but a special kind of simulant, or perhaps their own simulant, that is not modelled on the behavior of any physically manifested person, but of some subconsciously-created model that satisfies what it means to be a person, subjectively. The host, the primary consciousness, also no longer has, or exercises, control over the tulpa's environment. It becomes independent simply because the host believes it so.

I have omitted a great deal on topic like what it means to be conscious, or what it is like to have an identity, because that would require significantly more discourse, which would really only be appealing to the philosophers among you :P

— Grissess, on "We are /r/tulpas, creators of sentient imaginary companions. Ask us anything!" (/r/AMA/)

...

By relaxation and effort I meant not physical relaxation or effort, but mental relaxation or effort – I think what I'm referring to here is akin to what you are calling flowing with momentum v. re-intending.

Yes. They're probably related though: physical tension (being made of mind too) probably gets in the way of the other.

I think this is what I'm trying to say along the lines that you think in. Basically, we don't have to maintain stable traces (what I call habits, I think) and only adjust those maintained/stable traces when we manifest making deliberate decisions.

Right!

I think that all choices and free interventions and redirections are in a sense unfolding expressions of intent/will similar to the way that habits are unfolding expressions of intent/will.

So, this is a tricky area. Can we run over it a few times?

I'm think that there are two parts:

- When I "make a decision", that is a bit of "thought theatre" where I appear to mull things over. Really, that's just stuff happening along existing lines. I'm not actually intervening in the path.
- When I "redirect", I am actively "changing my shape" or changing my nature such that subsequent manifestations will be in line with that.

Now, I will always make a choice that is in line with my Nature - so that is deterministic - however, the options that appear to me do so creatively and cannot be predetermined - so that is non-deterministic. (That's why we are free.)

Tulpas

Never felt the urge, but came across the topic and found it fascinating. Particularly the idea that our own personality "in our heads" could be classed as just "the first tulpa", spontaneously created as a response to interactions in childhood. What you "really are" is the aware space behind that; "you" are just an experience you're having.

Identifying with one "tulpa" or another is arbitrary. So people could create a new tulpa, and then shift their identification from their default personality to this. (Probably not recommended. Who wants to become a toy stuffed snake for the rest of their life? ;-)

I think that you are the path. I think that making a decision comes in context of thinking, imagining, and contemplating. That relationship is intentional - it's a manifestation of your will.

The 'thoughts that appear' are in line with your 'underlying Will' - let's call it your current nature. But you do not deliberately choose them or control the process. It's just an experience.

When I'm walking on a trail and I come to a fork, I'm not just responsible for the first step I take down one of the forks. I can always stop, turn around, wander into the woods, whatever I want to do. Every step is intentional and my responsibility. Similarly, every thought, action, and decision is intentional and my responsibility.

Basically, when you do intervene, you can say that subsequent events are your responsibility and that by making an intervention at some point, you "intended" the path that resulted - because you never interrupted it.

We're saying the same thing, it's just that I'm emphasising that it is very rare that we actually decide/act. Mostly we just experience the unfolding results of our current path.

- Your world unfolds deterministically from its current point.
- However, you can "intervene" at any moment to change its direction, to set it on a different path. (Other words for "intervene" might be to "re-direct" or "intend" or "decide". However, most words have non-deliberate-action meanings too, so it can be confusing.)
- The fact that you can intervene at any point means that you are responsible for what occurs, and could be said to have "intended" the outcomes even though you didn't consciously choose the details of those outcomes.

I don't think we have an essential nature. If we have a nature, it is infinite freedom. No choice is deterministic, it is volitional.

Our essential nature is wide open unstructured space, yes. However, from very early in our experience we accumulate "patterns". Probably from our acquisition of a body structure as a foetus onwards, perhaps even earlier in the form of some 'felt structure' from simply having a presence in the world.

What people call "True Will" or "True Nature" is really the structure or pattern we've inherited simply by appearing in (or as) a world such as this. Further patterns get laid on top. Stripping the secondary patterns returns us to our natural place as a being-of-this-world. Stripping that back, leads us to absolute open freedom.

If we have a nature, it is infinite freedom. No choice is deterministic, it is volitional. Even if it is in line with my presently maintained commitments and habits, it is still intentional.

Hopefully, we've got to the bottom of that earlier in this reply? If not, tell me.

Deterministic is a word generally used to refer to the idea that something is externally determined and out of control. Unless you mean that I determine those choices.

I mean "deterministic" more in the philosophical/scientific sense. I mean that, once a path has been set in motion, it will follow a cause-effect narrative just like dominoes falling down. This will continue until a conscious entity intervenes and redirects the flow to a different path. Most people do not make interventions; their choices are simply experiences along the same path.

Unless you mean that I determine those choices.

It's a tricky area.

We don't determine the options but we choose which option to follow. What saves us is that there is a creative aspect: At any point (once you are free from being a particular "person") you can summon fresh, creative options to choose from - options that could not be predicted in advance, direct from the infinite creative fountain of background awareness.

That is where we get our real freedom. Freedom to choose amongst the options we see is one level of freedom - freedom to create new options that could not be predicted is a whole different level. (Obviously, the new options come from 'the whole universe' rather than 'the personality', so it's a matter of contribution. All options come from 'structure' of one sort or another.)

[On the "first tulpa":] I think this is a fascinating idea, a great point I never thought about before. I'd be interested if you wrote out your thoughts on this in more detail and made a post.

I'm trying to tie together pattern formation, "learning", personalities and world formation at the moment. If I get it sounding reasonable and coherent, I'll be doing a post on it definitely. I'd like to follow the full story from empty space to randomness to patterns to structure to world, and the implications for "me", "the world" and for "magick".

This would involve nailing the above stuff in terms of language too (which is the problem I/we have more than anything, rather than the actual content of our ideas).

EDIT: Lots of people play with the free will vs determinism thing (see here for someone who even does the dominoes metaphor). You can short-circuit it by saying: "I have the freedom to intervene according to my own interests, based on the information available to me, and that's good enough." It then becomes about how much information you have, and whether you have a "gap between impulses" which lets you intervene - which is where freedom to summon options and choose between them lies, and is a matter of (dis-)identification with mind, body and (re-)identification with awareness.

...

Related thoughts, that occur to some people when they have expanded insight: If we've got it all figured out, with absolute power, what's the point in going on?

I'm excited that you posted this because I had an intensely similar (if not a little darker) experience on mushrooms. It was my first time, and there was one guy (sober) telling me that I was literally creating my reality and could experience whatever I wanted. His tone was not that of new-agey speculation, but of knowledgable certainty. We would talk about music, and a guy would ride by on his bike and ring his bell an abnormally large number of times. We talked about girls and two girls came up and introduced themselves to us. His message was, if you want it, believe it will happen, then it will.

Later, I'm upstairs at this girls house, she had just gotten out of the shower. I should preface this with please do not try this at home**. I walk up to her while she's in a towel in her bathroom and give her a hug from behind. She dropped her towel exposing her naked self to me and let me feel her breasts. After holding her for a moment, I walked off in amazement thinking: "holy shit he was right, none of this is real, it is essentially a dream, if I believe it, it happens."

I walked back downstairs to confront the guy who told me this. He's laughing, enjoying my dumbfounded confusion of how to handle the situation. I begin to get scared. If I'm Neo, who is this guy? Then everyone goes upstairs and we read Shel Silversteins "The Missing Piece." If you don't know it, it's about a pac-man-esque circle who rolls around trying to find his missing piece so he can be a whole circle. There was a very profound feeling while we all sat around to read this childrens story book - like I was being told a story that was a metaphor for something of ultimate importance. It turns out that the circle finds its missing piece in the end, becoming whole and entirely satisfied, before realizing that was paradoxically the most unsatisfying experience it had ever had. He much preferred the thrill of finding the missing piece. All the while this guy is looking at me nodding, as if to say, you should be paying attention to this.

I'm struggling with reality at this point, not sure if I can even consider what's happening to be real. I realized that having god powers meant complete control, complete control meant no free agency for others, no free agency meant no one was real. I then had visions of my family as puppets who only did my bidding. This scared me beyond expression. I felt very alone. I asked one of the people there if I would ever be able to go back to the way things were. She asked me if that's what I wanted. I said yes, and she says "then it will." Sure enough, I fell asleep, and like dorothy waking up from the Wizard of Oz, all the craziness had disappeared. All the people there were back to being real, and the guy who had been my Morpheus for the evening was back to being a regular guy.

POST: Getting excited about the unknown

I'd never heard the term "bibliomancy" - it's great!

In the dreams I know that whatever comes up isn't an issue because it is undoubtedly just more dream material ... My feeling is that there isn't anything but this dream-material.

Haha, yes! The fear maybe comes from thinking that you are "real" rather than also dream material? But if it's all dream material, there's nothing to fear - it's just a matter of when you are going to say "yes" to the dream.

...Doesn't mean it won't be a bumpy ride - the first thing that'll happen is things will try to line up with how they should be, rather than how you've forced/resisted until now. But longer run, yes.

EDIT: The most important windows are metaphorical.

The issues, limitations are due to "conceptual momentum" - basically, the co-creation or co-influence aspect of this experience. Once habits are formed, you need to either dissolve them or intend across them. Dream-worlds have habits too, remember. When you walk in a dream, do you find yourself constantly falling through the floor? No. Why not? It's just a "dream floor"!

In a lucid dream, we assume we have complete control.

Hmm. And we don't have complete, direct control. We control/seed our expectations and the environment responds, within the limits of our beliefs about the dream.

A dream of being awake is the same as being awake, if it has all the properties of waking, I'd say. Right now, you are dreaming of being awake on Planet Earth.

Sure. I was just trying to make the point that a dream of total control ultimately isn't any different than a dream of total futility. They are the same essential substance, the same event. "We control/seed our expectations", In my view this is equally part of the dream as well. edit: I'm just trying to consciously know the source of all dreams. That's my goal. So I realize it kind of departs from this subreddit's point of focus.

Yep, it's all dream.

edit: I'm just trying to consciously know the source of all dreams. That's my goal. So I realize it kind of departs from this subreddit's point of focus.

I think there might be a problem with that: I think you will never be able to experience it. Experiences are made from 'dream-stuff' - sounds, pictures, sensations, all that - but 'dream-stuff' itself isn't made of anything. If you ever experience "the source of all dreams" it will just be another experience, made out of dream-stuff. The source of all dreams is: open, unstructured consciousness, shaping itself by itself, causelessly - intention unfolding.

That's how I'm seeing it at the moment anyway.

When I look honestly, it seems to be like this: there isn't anything but dream-stuff and the open knowing of dream-stuff is an inherent, inseparable property of dream-stuff. Wow!

Yes! I offer you the blanket metaphor:

The analogy of the blanket, where the blanket is "raw awareness" and ripples or folds are "objects", is quite apt. How does the universe know itself? A blanket with no folds could not experience itself, relative to itself. Only by 'taking on shapes' can consciousness experience itself.

Openness is unfolded blanket (non-stuff), while the folds of the blanket is the content of experience (dream-stuff, the blanket experiencing itself). So they're never separate. We just get confused because we think of 'dream-stuff' as separate objects rather than patterns in continuous awareness.

Dustin Hoffman knows I'm right. [<https://www.youtube.com/watch?v=XfliRKLMjDY>]

Nice, never heard the blanket metaphor before. What movie is that clip from?

It's good eh. Replaced my "tray full of jello" metaphor, thank god. :-)

(Although what I said isn't quite what he says in the film really.)

It's from I Heart Huckabees. Jason Schwartzman and Mark Wahlberg become the clients of "existential investigators" Dustin Hoffman and Lily Tomlin. Full of quirky fun but clever observations too. It's worth your while!

...

My suggestion: You can simply decide and accept that it is - it will then gradually fall into line. Or you could try lying down, relaxing, and strongly asserting it with Will to shift more quickly, on a daily basis. (Similar to how in Tibetan Yoga you are encouraged to constantly say "this is a dream" during your waking life, but x10 it.)

If you keep tinkering with the debate, though, your perception won't settle.

The mistake you are making is: "you" are not fundamentally real either. You are the dream-space (as emphasised previously here). /u/everydaymotherfucker is a dream character just as /u/TriumphantGeorge is, and your friends and family are. It just so happens what you really are is experiencing its dream from a particular perspective.

See here for instance, for an idea of how it can be if things truly dissolve.

TL;DR: You are a figment of your imagination too. Recognising the dream does not alone dissolve the habits of the dream, however it does mean you will realise how intention works, and how you can get your desired experiences.

It does all like to line up, given half a chance, which is nice. Yep, keep it dreamy . . .

POST: Anyone ever heard of Bashar before?

[POST]

[<http://www.bashar.org/index.html>]

I found this uniquely interesting. I don't 100% agree with it or anything, but you might check out the 'principles' under the 'about' button. A medium channeling an extraterrestrial from the future who is trying to awaken humans to their innate divine potential, basically. The stated motive is that humans are so shitty that if other beings in the universes see that humans can make themselves lucid, then they will gain more confidence in their own capacity to become lucid. I think it is fun and interesting. What do you think?

[END OF POST]

Yeah. I'm not so sure about his "style" and the manner of his inspiration, but his 5 principles are about right:

1. You exist...you always have and you always will. You are eternal.
2. Everything is here and now.
3. The One is the All and the All is the One.
4. What you put out is what you get back.
5. Everything changes except for the first four.....

POST: A report on my recent experience.

Interesting. The pain thing, particularly: pain is like an interpretation on top of a sensation, I find.

Yes, intention should be effortless. Attempting relaxation is a great way to practice. Lying down and simply Willing to be relaxed without doing anything, feeling the initial resistance of your body before it dissolves, gives you the experience pretty directly. There is no "strength" to this Willing, you simply direct your experience or you don't. And you make sure you don't fight any resistance; you just persist instead.

One can get caught in one's own perfectly created dream, and the dream can begin to run away into random directions if one disowns it too much. I need to be careful not to be a victim of my own success.

Care to expand on this idea?

If it's effortless, it's not me.

Yes, we think that if something involved no effort, if we can't detect ourselves doing-by-pushing, then it can't be us.

...

I never quite got the language right for willing and intending either. There's the "target experience" (your intent? your direction?) and then there's the "active directional wanting", the thing that you do (willing? intending?) for your current experience to move towards and become that target experience?

...

...Good response. Yes, "wanting" isn't what I meant really. By Will, I mean that we change the 'shape of ourselves', towards a desired shape, our 'Intent'. If we were to release ourselves fully, then our experience and actions would always correspond to the desired shape. Any sense of 'resistance' against applied Will now, is due to your owns resistance, rather than the requirements for a "force". In effect, you are Willing in two directions at once, hence the tension when it is experienced. On sensing awareness as it is, this post was interesting.

Sensations are a fact of awareness, but you can be self-aware or aware-aware. The perceptual space in which experiences arise. By awareness, he means what you call mind - really. As opposed to attention, etc.

I would say to him, "If I am awareness, I should be able to change you to Bugs Bunny."

You might find this article [<http://www.integralworld.net/salmon18.html>] interesting in that regard. And also this talk [<https://www.youtube.com/watch?v=CRiVYv2ettA>] on physical laws, and 'intervention'.

The way in which Spira declines striving is in the sense of using effort to look for what you are, not in the sense of wanting to be personally better and more successful, say.

However, we should return to this 'fatalism' idea. So, if you're going for all out subjective idealism (it's all you, just you, and there's no Rupert Spira guy, it's just you saying things to annoy you) then you can do anything, anything. Rabbits into roller coasters. Stay young forever. Would you say that the reason you aren't seeing other people do this is that they are "your world" and you don't believe it yet, haven't made it possible yet?

I have tried many experiments of a 'direct' nature, include some time-fiddling stuff. There have been results - revised histories etc - but I do seem to confront an inertia which isn't my personal inertia, it seems.

Meanwhile: the idea of conceptual momentum? [<http://powerbeforewisdom.com/Fundamentals-of-Magick/Will-vs-Physics.html>] Quote from article:

Back to my dispute. I believe that the laws of physics are able to be affected by will. I believe that the assumption that the laws of science are universal, persistent and solid actually helps make them so... until they encounter different beliefs that are either more strongly willed in a local area or which have more “momentum” for a lack of a better term.

(Several good - as in thought-provoking - articles on that site.)

...

He doesn't though. He denies the role of will. He also doesn't talk much about knowledge being important in experience.

The 'will' part is something that's problematic for most non-dualists. Other than that, he's pretty good at pointing out the experience. His TV Screen metaphor is just to show that your experience is made from consciousness, only you don't notice mostly. Most people don't get that far - it's a good first step before you do stuff. Well done you and me, but we're not the norm. I think he presents it excellently for the newcomer.

Duh, no shit! Subjective idealism is the topic of this subreddit. LOL, so finally you want to discuss it? I am pleased to hear that.

Sarcastic b*! ;-) You know what I mean. Our phrasings swing back and forth between assuming it and not. Nefandi is a dream character, of course, with human limitations. To do more, you need to become "the context".

I think of Spira as an entry door. This is how some people get introduced to thinking about the nature of mind.

Of course. This is agreed. Then read a good lucid dreaming book (Waggoner) and apply what you learn. However, "fatalism" is neither here nor there - limitations are revealed to exist or not by successful action. Anyway, the key difference is "Will" and that can only reside as a movement of the context awareness (the real you, mind, whatever). That's what's missing in discussion of brain/consciousness/free will, and so on. That's where the "magick" comes in.

Okay, that was fun. Subjective idealism, here we are. But why oh why am I not getting all the results I want/Will?

Bah, I think Spira puts it well and I like his books for getting the direct experience (for our larger audience). You, of course, are super-advanced and it's all just kindergarten for you. ;-) Wasn't comparing you to anyone, of course.

Wrong. Failure doesn't reveal limitation. Think about it.

It does; depends on the nature of the limitation though.

Because you think you're a human.

So for as long as I continue to get negative results, it will be because I still identify with being human? Sounds a bit of a get-out.

Think about it. When you control your lucid dream environments, are you doing it as the character or as a dreamer of the whole dream?

etc. Look, sure, I know this. And reabsorbing "eggs of separation" and regaining their power is not new - e.g. even business versions:

Question: Using your language, if I’m creating and experiencing the illusion of an economic downturn, the numbers aren’t working, and it seems like I need to layoff employees and take other cost-cutting steps, how do I handle that in Phase 2?
Answer: Illusions are illusions. The storyline doesn’t matter. There’s nothing unique about the illusion of an economic downturn, layoffs or cost cutting measures. . . Use the Process (reabsorb discomfort) as you see fit.

However, it seems to take far. too. long. It'd be nice to come up with a more blanket technique. My 'overwrite everything with empty space' works quite well, but you need to persist doing it in circumstances.

It's not about ignorance though. You can realise you are 'all this' but not directly experience it, still have bits and bobs of separation causing you trouble. In my experience, you do have to 'do something' to bring things back into you (or 'the one' or whatever), to dissolve boundaries when they appear.

And they're not always there, they're often enfolded - you can only dissolve them when they appear.

However, it is what you call felt-knowledge

Yes, the "felt-sense".

What happens when you become lucid in the dream? Does your feeling change? Generally for me, nothing changes other than I now suddenly know,

There is a 'clarity' though, an opening up. The quality of it does change.

That's not my experience at all. It's definitely not from lucid dreaming.

I'm talking about dissolving boundaries in "real" life, when you encounter a discomfort of separation in a particular situation, and dissolve/merge it to make it fully part of you again.

Clarity: I meant, upon it turning lucid, I find the clarity increases. Then I can do what I want, but everything does become more "so".

You should be able to treat any appearance as you would a dream. So it's strange that "real" life demands a different approach from that which I use during lucid dreaming. You have to explain why so.

It is apparently so, in terms of the reduced flexibility. However, the 'using prolonged Will' aspect is the same.

...Yeah? I find there's a bit of a shift with the knowing. But you could just say that's the "felt-sense" of recognising it to be a dream.

...Good idea. Actually, the relevant stuff for 'oneness' would be the dissolving the 'threat' of apparently external things, such as bills and other financial stuff. In fact, all boundaries correspond to, or are signified by, feelings of discomfort or tension in the situation. This is easy to do, but the things need to be happening now, first. Okay, will do that later this week.

More extreme: Time travel (experiential time travel). Possible? I often use time travel as a way to explain that arbitrary-moment view of experience. Goddard's "revise your history' is in a way similar to this. Will include an example of that too: it's basically a dissolve followed by a creation.

...Right. What I'm talking about is absorbing and dissolving the "felt-sense" of separation of something. Basically, taking the external "stuff" and making/recognising it as internal, part of you again. Once done, these things fall within your "control" - or at least, they fall into line with your Will.

Subsequently, things will not be pursued against you, people change their moods, all that. Rather than having to explicitly manipulate, doing this just means things "fall into the right direction". It was the Business Game book that first game me the idea to do this: surely if there was no sense of threat, then the threat had been dissolved?

It's not teleportation, but it's pretty useful. The "felt-sense" isn't like touch-feeling; it probably corresponds to what you are calling "knowledge" (but not "I know facts"), or "knowing" or "experiencing".

It sounds intriguing.

You encounter something. You feel discomfort. You dissolve that discomfort into yourself. You find that the corresponding "external" object, what it represents, gradually stops being a threat. For instance, people pursuing you for something - will just stop. You can replace the "discomfort" with "gratitude", which works too. Some people have experimented with returning their bills, writing "not paying, thanks very much for the opportunity" and doing this. I never went that far!

Have you encountered dangerous wild animals?

People. Yes.

...A bit of both. The dissolving of the tension feels like "taking it into you". You are doing it "within you".

No, you don't get to remember their memories, etc. Actually, it really is more of an "internal working" than a reaching out externally. You are dealing and changing with your own response (=assumptions about meaning?).

Doing magick in an LD is often a great way to get success. We need to put a bit more effort into extending around abilities into RL, though. It is not necessarily true that we'll be able to convert one thing to the other (despite our brushing aside of 'fatalism', etc).

...The timescale matter, of course. If it's not tomorrow morning, and not next year, and not by 2030, then it doesn't matter (if you'll excuse the pun). There is a separate thing there: persisting oneself beyond the "vale". However, if we can't do "amazing things" in a relatively short period of time, I'd be pretty disappointed surely?

...Okay, revisiting stuff: Have you experimented much with Neville Goddard yet? It's the most direct thing going. In fact, really, it is the only thing. Even just doing a daily "overwrite yourself with the feeling of empty space" works wonders. I've been deleting all sorts of bad ideas/assumptions along the way.

(In fact, I'd say, this is something to do whenever it occurs to you as you go about your day. Where your body "apparently occupies", create the "direct felt-sense" of open, empty space, blending seamlessly into the surrounding environment.)

...I was already thinking similarly and doing something of the sort prior. I don't deviate from my own style.

I often find the same thing. Yes, it's a good read, can provide inspiration. New take on things: just decide. That's all. Nothing else.

Yes. Usually I come across books that are already what I'm thinking about, they just expand things a little, or provide a useful context. Goddard was like that; I was already doing open-space-overwrite, and that just made the connection between that and a felt-sense for desired situations. It's inspired a mixture of things: an Alexander Technique idea (from Missy Vineyard's book, How You Stand, How You Walk, How You Live) and a sprinkling of Les Fehmi's work (The Open Focus Brain, Dissolving Pain) and Douglas Harding's Head Off Stress, seeing that you are empty space really, and Eugene Gendlin's Focusing work, particularly his larger psychology book (rather than the small introductory one). It's inspired by those, bits in each of those. It's not in any of them. Nearest is Dissolving Pain, I'd say. Maybe because I'd referenced the "summoning of the feeling" that Neville talks about at one point? There's a similarity there. Just imagining visually doesn't do it, you need to "feel" the space in place.

...That's exactly it. I used to do it just with the space in the room, then reaching out further into the structureless "place" - then I realised my body was just an idea "overlaid" on experience, and so deleted that too. At that point, you realise your "body area" is actually home to other things, such as "stuck thoughts' and "uncompleted movements" which you have accumulated over time.

In fact, your human body is already your body. Can you bend your bones as you might rubber? I bet not. And you're one with your body. So here again is evidence that oneness is useless for magick.

You probably aren't "one" with much of your body, but I recognise your point. So, what's the missing thing? Magick tends to work by synchronicity mostly, with only a few people getting further (a guy doing 'Abrupt Physical Manifestation' creating patterns in plates, etc).

The missing thing if you can't bend your bones! But if you can then the missing thing is your attachment.

...Bah. You should give it a go. "Obviously true" as in, they can be applied and correspond to observations. You will disagree with it overall, but still. Elimination of co-creating agencies is a must. How to reabsorb them?

POST: Not all insanity is created equal.

And to have no thoughts easily and reliably you literally need to have no concerns about anything. You need to be certifiably insane.

It can be a positive stance, Zen style: that you understand that the appropriate action will occur to you in any circumstances if you let it, since you are part of the larger movement of the world; and recognise that thinking about things and planning actions in advance doesn't actually help you act appropriately.

Yeah, I see two types of thought:

- Unbidden thoughts as arising spontaneously from 'tension' or conflict of some sort, so trying to eliminate the thoughts while still retaining the conflict isn't going to happen. You either get rid of the tension by investigating it and resolving your conflict, or you simply accept it and release control, let go and let it unwind.
- Intentional thinking - deliberate rumination and planning - that's optional and you can simply decide not to do that. You may be an obsessive thinker, but you can decide to give up and let it go, and decide not to follow unbidden thoughts in to rumination territory.

Trying to deliberately fight the first type of thought will not work. "Good Zen" involves simply "sitting" and letting thoughts rise and fall and finish their business, remaining with sensations rather than trying to shut thinking down.

Leading to: surely "seeing all this as a dream" is the ultimate in letting go of personal control and localised (bodily) tension, since we then identify as the whole thing? It's all an "expression of you", after all.

I don't think any authentic Zen masters considered the world something larger than themselves. And neither do I.

No, they considered the world within themselves, but the character they were experiencing was part of that world. So concerns about the character acting appropriately are misplaced. (And mostly when we talk of action in everyday life, we are speaking of that character.)

It depends on what you mean by "personal."

I mean, controlling your "body" (mental or physical) directly - intentional thought and physical control - and by retaining tension in it as a defensive/conflict management approach. What I really mean is, if you truly accept this is a dream, then many of your concerns would evaporate - you would release your grasp - because those concerns are for the survival of the character, not the dream.

Maybe? It's not 100% certain.

For sure, there are different folks and different strands. Most of the stuff I've explored seems to come to this though. Zazen is an allowing rather than a striving.

I don't equate my person with any specific body.

Sure, but most people do, and I'm talking about how a person moves from one view and way of living to another. For clarity: "who you really are" is everything, whilst "people", including "your body", are characters/mental objects within that.

Zazen allows striving and relaxation...

I don't think we're actually disagreeing. It's a "lively sitting". The point I made before (see other response) is that the point isn't to stamp out thoughts.

What do you mean by "everything"? Are you saying I am the sum total of the manifest things?

No, you are that in which the apparent manifest things appear.

If you can conceive of yourself that way, then you can conceive of yourself any way you like. If you can see yourself as a formless container that takes on the form of the objects of experience, then equally you can identify with any object, or configuration of time and space.

Once you've hit "openness", then you can pick and choose. Being able to choose to limit yourself - for fun or curiosity - is the greatest freedom.

One might say that our present localised experience is a limitation we freely chose at some point, but we don't remember. Moving on: The initial pitch was mixing subjective idealism with chaos magick, but we haven't really explored that much.

...I did spot that post, actually. I thought this was interesting:

If you tell your friends, the world will change to make the event mundane. It will turn out that someone left the pad in some sort of diagnostics mode or there will be a software bug that allows 10% of random codes to work or something like that.

This is true, in my experience. The universe (heheh) strives for self-consistency. Open the door, there's a room beyond; seek an explanation, and one is provided. But also:

Magic isn't about making unnatural things happen, it's about making natural things happen at the right times and places.

I just founding it interesting that someone would phrase it that way. I think that if one does not specify the route the result will take, then it adopts natural processes as the mechanism, in accordance with your own understanding of what "natural" is. When you look for an explanation, one will appear which, again, fits in with your idea of what a reasonable explanation would be. The alternative is for you not to retain a memory of the change. (Often others don't retain memories pre-jump.)

...He's the man. I think coherence is semi-inherent. I think things arise in patterns across time rather than events, and so the 'world' tends to keep being 'of a piece'. Once you've accepted one thing, other things tend to fall in line with it, and so on. If you're not a believer in such things, it could be that your 'reality' of your 'extended person' won't contain such experiences, and you'll subjectively 'split off' if something like that's going to happen.

...Not the best wording. That the world will tend to serve up experiences in line with your beliefs, and that your memories will tend to correspond to your current experience. Your subjectivity would 'split off' rather than give you an experience which wasn't coherent (wasn't consistent with itself). Yes. An unwitting strategy though. It's either avoided, or edited out.

In our current reality "don't like strangeness" probably describes most people, right?

Whether they realise it or not, yes. Someone over at 'Glitch in the Matrix' just posted this [https://old.reddit.com/r/Glitch_in_the_Matrix/comments/2gqtyb/metaswitching_realities/], and I thought I'd have some fun replying. :-)

...

The problem would be, can you overcome the momentum of experiential habits such as these?

You fear a personal death. And to be sure, to genuinely confront the nature of yourself and of your world, will indeed involve your death in a fundamental sense. What seems insane on this side of the jump, won't be on the other. Say: If you genuinely experienced the world around you as a dream, and yourself as a dream figure, then the solid, material everydaymotherfucker would be no more. You would be part of a larger movement. You have to give. up. (Your personal self. Not a life.)

Stop thinking, my friend. Just stop. You cannot work this out by thinking. The other side, as it were, isn't "over there" - it's "in here" and all around you. It's not even a "side", it's where you've been (and what you've been) all along. So no need to worry! :-)

I'm going to give you a daily practice to do, and other than that you're just going to get on with your life, and see what happens, okay? Stabilisation is key. Here it is:

- 10 minutes, twice a day.
- Lie down on the floor, feet flat with knees bent, head supported by books, arms by your side or hands resting on abdomen. (Like this.)
- Decide to give up completely to gravity: to "play dead".
- Let go of your body and mind, let them move as they will. Allow them to unwind.
- Don't even "pay attention"; just let your attention be open and wide. If it focuses on some thought or pain briefly, let that happen, and let it open out again.
- After 10 minutes, decide to get up, but don't do anything about it. Wait until your body moves by itself. (This won't happen first time, but eventually it will happen.)

Basically, you are letting the "stuck thoughts" and "uncompleted movements" you have amassed unwind and dissolve themselves. You do not need to do anything for this to occur. Gradually, your perception will become clearer and clearer.

Note: Any effort to focus or do anything will get in the way. There is a method of accelerating this by "overwriting yourself", but it's nicer this way.

This is all you need to do for now. As you go about your day, if you feel yourself becoming tense or defensive or worried, take a breath and just mentally recall the last time you were there, supported, by the whole universe. Okay? Trust in that.

Thank you very much :-) I will try this exercise beginning tomorrow, but for now it is time for bed. I plan on sticking around here, this subreddit has really grabbed me. I was reading lots of the posts between yourself and Nefandi and they were very interesting. Out of curiosity, what is this "overwriting yourself", what does it entail?

I should write a post on it really...

Rather than allow the "mental objects" in the space of awareness to gradually unwind and dissolve, you can overwrite space to be empty by direct intention, summoning the extended feeling. However, it means you get no acclimatisation and you are completely evaporating the boundaries very quickly. It involves confronting an existential fear of openness. Imagine if you wished the floor disappeared, casually, and suddenly it turned into an infinite void! You might be... uncomfortable with that! :-)

There's no rush, though; I think it's better to do it the gradual way. Note that Nefandi and I are pushing the edges in our discussion; there's no reason to commit so fully in my opinion, until one feels that they are at that stage (or even ever, as you see fit).

Anyway, do update on how you get along!

...

So what you call "unbidden" I'd call "irritating." They're still your thoughts even if you don't like them.

Surely, but the difference is useful. I can sit here and generate and pursue thoughts deliberately. If thought are arising from conflict though - even if that conflict is an ongoing and maintained conflict through unconscious intention - they are still unbidden, in the sense that I was not intending thought as the outcome. All experience is intentional at route, however there is a difference between direct outcomes and indirect.

In the direct creation of thought one simply has to stop creating them. In the indirect creation of though one has to stop doing whatever-the-indirect-thing is (in this case, the maintenance of conflict or tension).

I strongly disagree. This isn't good Zen at all.

Okay, context is all: the point I was trying to make is that "Good Zen" doesn't involve quenching thoughts by trying to stamp on them, that's a problem and muddling up with modern Western meditation nonsense. It is a staying-with, and more.

Sakyamuni said to the vast assembly, "Through sitting in the lotus posture then samadhi is realized in the bodymind and its virtue and dignity can be recognized by the people. Just as the sun illumines the world so the mind is cleared of dullness, laziness, and indolence. The body is bright and not dull. Perception and cognition are also bright and supple. You should sit like dragons coiled. Just the image of the lotus posture brings fear to king of the demons of delusion. How much more so should he see someone sitting without collapsing or leaning but actually experiencing the truth?

Quite so.

All good. And nice quote. "Investigation" is a good word. It's not an effortful investigation, or a manipulative one, it's an exploration of what-is.

TriumphantGeorge Compendium - Part 20

POST: Playfulness.

Extra one:

Imagine - feel - that beyond your field of view, the world just stops, and there's just... blankness. If you're indoors, the view out of the window is just a flat picture, nothing behind it. If you're outside, then the landscape at the end of the road or the garden is just a vertical image, then nothing. And as you walk around and the landscape unfolds, really imagine that it's being created 'just-in-time' for you to experience.

(Extended version: There's always darkness in the direction you're not looking in, in your own self portrait, and the things you see before you are just floating transparencies.)

...

Schizophrenia here we come for the first bit! :-) I really like the "live mash-up" idea, turning things into blended movie scenes. Great!

But honestly, a shift towards some healthier perspectives and philosophies makes mental issues it a totally different experience.

Hmm, so if people have a larger context then these experiences aren't necessarily so problematic. The universe does give you messages, but not always; you are connected to something larger than yourself, but you are also an individual. It's when we are consumed by the experiences that it's a problem.

... how they took a shaman from Africa and showed him the ... He says we have lost the power of ritual which brings understanding and peace to those persons.

With psychotherapy and so on being modern attempts to vent that, but only within a specific modern context. Interestingly though, more and more techniques are approaching vision-searching and shamanic types - Focusing and Reichian stuff, even the current mindfulness fashion. The more we lock ourselves down and 'externalise' aspects of ourselves, they more they will try to break through?

The truth is that normality is a variable in space and time. And delusions stem from interpreting strangeness as symptoms, instead of tools to dismantle the conventional boundary between reality and fiction, truth and falsehood, sense and nonsense.

Yes, I think a lot of modern problems arise from trying to deliberately narrow our experience within certain boundaries - our experience of what's around us and what arises within us. This is why modern life can be so stressful maybe: you are subtly engaged in a constant fight with your moment-to-moment experience.

The missing skill for the typical modern western person, I believe, is to be able to actively engage and disengage with experiences, both conventional and bizarre.

I suppose our basic model is that of "we see things directly". This isn't even about materialism/idealism or whatever - just the assumption that our experiences are unmediated, and responding to them in that way. So we tend to discount things even as simple as how our attention is directed, and that we can take control/responsibility for that, than we can widen with context, or narrow for immersion. Instead, it just all seems to "happen to us", mostly. That, and not understanding intention; trying to do everything 'muscularly' or 'bodily', not realising that the direction we "set" is the main creator - I have been thinking. Any moves in society which shift us along these lines has to be a good thing.

It seems more and more in recent years, to me, that the right way is to not append a truth value to it.

To accept the experience as is, and then have the interpretation as an additional thing, rather than having the two be blended? Then the interpretation can be judged on its usefulness. I like that.

Although this subreddit is about subjective idealism, my baseline default view I go for is much simpler and is simply that of direct experience. Upon investigation:

- It feels like there is a big open space of awareness.
- A world of objects seems to arise within that.
- Bodily sensations and thoughts appear there too.
- The experience seems to respond to my intention in limited ways.
- The response seems to include the environment, as well as my thoughts and my bodily actions: coincidences and opportunities, tuned.
- Whatever is "behind" the experience can never be known, or whether there is anything.

With the addition then that anything else is "explanatory icing on top" and should be recognised as such. Getting narrowed on any one interpretation tend to block out the arising of, or the recognition of, other paths that might come up which are better suited to your desires as they change.

("Getting narrowed" was the nature of my mistake which got me into my messes.)

...

Nice. One word: soundtracking! [<https://www.youtube.com/watch?v=mCJOZ8dgSLM>]

Similarly, if you're bored, adding (non-matching, comedy) subtitles onto your day is good fun. Don't pre-think them, just decide you're going to have some appear when people are talking, and you'll be surprised at what comes up. Oh, and everyone should be wearing a silly hat.

...That's great, how it can be customised too; I'm going to play with using that sound. I wonder how far we can go with this, treating our current experience as the "raw material" and editing it. This is pushing towards hypnotism all this (of course, same thing really), but can we edit out sounds and so on, on the fly? I can add things in, pictures and extra sounds, with varying levels of clarity, but I'm not so good at deleting. And then, how persistent can things get.

My only beef with hypnosis is that most of it is highly associated with profit-seeking, and also...

Often, but that's more in the use than in the phenomenon itself. Actually one of the first 'esoteric' books I read was on hypnosis, by this guy whose page on fallacies is quite interesting. That and some book on visualisation by Ursula Markham, who first introduced me to the idea that visualising could affect reality (the old "create a car parking space for yourself" trick in particular).

We can, at least in principle. Isn't this known as a negative hallucination in hypnosis?

Yes, that's why I brought up hypnosis - but I don't seem to be able to do it by my own self-suggestion. And yet, I was viewing this editing process we're doing as essentially self-hypnosis. But actually, there's a bit of a difference between doing direct imagination stuff and suggesting something and accepting/allowing it.

I agree completely. But in practice, suppose you want to learn about hypnosis? . . .

This is where old-fashioned books come into their own. That the internet is the place we look for all our information means we are constrained by the 'form' that it shapes things into (websites, forums all require monetisation or that's why they were started). Authors of paperback books on a topic used to do it for the passion and for a selected audience, because the money wasn't good and the availability would be limited anyway. There are few website versions of that sort of thing, except from more academic

researchers or a passion for spreading the good news (e.g. Eugene Gendlin's Focusing library).

Let's see... how about editing out pain? Am I dissolving pain or editing it out? How would I know the difference?

Good point. Pain is an interesting one. You can dissolve it just by including into the the awareness space that surrounds it. This also works for distracting sounds: it seems to be the attempt to isolate the sound or ignore it which makes it distracting. But that's not quite deletion, it's incorporation or dissolving object boundaries into the continuum.

What is the difference you think?

I'm really not sure. At root, it must be the same thing. Something like the difference between deliberately picturing a car (which means you create a particular, chosen image), say, and just saying the word "car" to yourself (which will result in a picture appearing spontaneously). Is it about the level of detail you attempt to control? "Control" seems to be at the core though.

I have about 10 books on hypnosis from the best authors, including Erickson.

Yep, I still think the best info I've got on these topics is from some of the earlier books. (Those early NLP books are probably the only decent ones, for instance.) Luckily: PDFs.

You know that some languages are pictorial to begin with. Like the ancient Chinese was just a bunch of pictures. What I mean is, pictures are not necessarily all that different from words.

But there is a difference between generic symbol and particular instance. Chinese might be a "bunch of pictures", but it's not a bunch of specific images. In the first case I'm choosing this car (controlling the details), in the second I'm requesting a car. So with deletion, perhaps dying to control the negative directly is the problem (basically "don't think of an elephant"?). I dunno.

As I've learned hypnosis is 99% hard work though. I thought there was some trick to it, but nope. Just practice, practice, practice....

I think what's being practiced, though, is intention and being passive, no? The trick to self-hypnosis was always acceptance/giving up, or that's what I found. It's both easy and very difficult (like the threshold thing when inducing an OBE). The thing I found hardest was to resist the urge to try and make it happen.

MILD - good example. WILD or direct-entry being even more so. (Just looked up for examples, and I like the images used in this guide - quite Waking Life movie-like.)

I agree. Words and symbols are more abstract. A symbol doesn't tell you about shadows, hues, and the details of the shapes.

Suggestion: Symbols are abstract, but experiences are always concrete? (Except the experience of a symbol.) So I see the word "car", but it works by triggering a bit of a "car experience" in my awareness; that's how I get the 'meaning" of the word.

What I find difficult is all the talk relating to a hard split between conscious mind and subconscious. It seems like the hypnosis books take the perspective that the conscious mind is somehow an enemy. I always had problems with that.

Yes, it was just a hangover from previous worldviews I think, and a rubbish notion that you directly control yourself and there's the mysterious "other" to be wary of. To be fair, these guys mostly weren't philosophers eh.

I don't agree. I have many abstract experiences. I would go so far as to regard myself as an abstraction. To me abstractions are just as felt and real as any concrete phenomenon.

Explain further. By abstraction I mean "does not resemble the thing it represents, is pointing to". By concrete experience I mean, an experience based on senses, even if "mental senses". So the sense of myself might not be solid like a table, but it's still a direct experience, even though I can't describe it properly. "George", however, is an abstract symbol pointing to that experience.

Actually, I should reassign my words. Let's have symbols are pointers (obviously), abstractions are non-direct-sensory experiences (although they will likely be made up of images, sensations, etc), concrete experiences are external-world-type. Because when I think of the past, although I experience it as a visual timeline from left to right in my experience, obviously it's an abstraction. And if I feel time passing, sure it's a feeling, but it's not a thing.

"I" in this case doesn't point to anything.

Well, that's a special one of course!

Maybe the distinction between concrete and abstract is purely conventional and arbitrary.

I think that's so. All experiences are "concrete" in some way (there's always a sensory component), but they may mean something else. When an experience just means itself then that's fundamental.

That's why you can't explain love, it is "just itself".

Having said that, I think the experiences you list correspond to a "landscape of feelings", bodily sensations, that correspond to the subject or idea or the experience of "being in love" or whatever. You think with your whole body. If you think of "a tree" you get a picture maybe, and some sounds, maybe the idea of an environment, but also your whole body subtly changes into a slight tension-pattern associated with that idea.

This feeling-aspect is key to experience and knowing/being, but cannot be properly verbalised.

What are feelings, if not bodily sensations? If you are scared, for instance, how does that manifest itself?

Impatience is, I'd suggest, a feeling of tension between the position you are in now (literally, physically) and the position you'd like to be in - a muscular tension pattern.

...That's okay. You hear sounds without physical ears, you see pictures without eyes, you feel touch without hands, you feel bodily sensations without a body. You don't actually ever experience a 'physical' body anyway, of course. Even if you were a materialist, you would still have to say that you experience your body "after the fact", as a mental object. We could say "body-space-located" perhaps. But anyway, the feeling of fear is, say, a tight feeling in the stomach area, a clenching of the chest, other sensations, etc.

I know what you mean. But I tell you, when I was floating in blackness in that one experience, I felt fear and I couldn't feel anything like a stomach or tightness, at least, not anything normal that would be obvious.

I do know the experience (a version of it). It still seems to me that it is a "located feeling" with a "meaning". Hmm, but it's basically going to be a felt-sense meaning. You don't need an actual spatial body to have that experience, I guess.

...Open awareness at base (how can one experience a lack of something?). "Tension" is there's a discomfort associated with the perceived lack of change.

...But what would the nature of that experience be? A tension between your expectation and what's there? For instance, there's a difference between just experiencing an empty garden, and experiencing an empty garden while expecting it to be full of trees. The basic experience is the same, but the latter has tension?

So "an apple" doesn't really refer to anything per se.

Platonic ideals! "An apple" conjurs up a "mental object" of an "apple" (in picture form, other sensations, probably a whole structure actually), that fits or becomes "attached" or anticipates a whole spectrum of experience.

(This is an unsettled topic from hundreds of years, of course.)

I'm going to suggest it's a "global sense of apple" and that it's more felt than experienced as, say, a particular image. That's what I was getting at by "probably a whole structure".

There are only experiences?

We've just got into the habit of categorising some experiences as "concrete" (tables) and some as "abstract" (not tables). More specifically, when we look deeper, we discover that we define things which are actually felt-senses and felt-knowing as abstract. Probably just because they can't be described in verbal language, and representations can't be created in terms of images or sounds or sculptures. However, these felt-senses can to some extent be evoked by other experiences. And that is what art is. The pure-blackness experience is one of the things that eyesight improvement tries to do - the Bates Method, specifically. You imagine pure blackness behind your eyes, which corresponds to complete relaxation of the eyeball, hence optimal vision. Supposedly. But it shows the overlap between imagination and perception.

I guess we feel like it's editing if we think phenomenon exists objectively in some external domain. Otherwise we feel it's more like dissolving. But I don't know if there is a clear difference.

That's an interesting point. Also, there's a warning after dissolving pain not to "go looking for it" afterwards to check it's gone or whatever, because you end up re-creating it. Hmm....

- Dissolving is "delocalising" I suppose, de-objectifying something. That's how the pain thing works: you are dissolving the boundaries around a "stuck thought".
- Dissolving/editing a tree, what does that mean in this context? Exclusion of it from your awareness field I guess, releasing it into the background. "Inserting a new fact" into experience.

What we experience is a continuum which is "cut up" into objects, so we're not deleting that part of raw experience, we're just saying "don't interpret that as a tree", maybe?

In fact I like to check it out often, just to see if it dares to resurface. If the pain does resurface, that's good. I just remove it again, and better.

For sure. I think the advice is tailored to those less well-versed than the likes of you and I! But it's an interesting point: that you can dissolve and and recreate it at will. So it's not real-real.

"What we experience is a continuum which is "cut up" into objects, so we're not deleting that part of raw experience, we're just saying "don't interpret that as a tree", maybe?" Maybe. I've never done this, keep in mind. So I can't talk from experience.

I was thinking of how it might work in hypnosis. Thing is, I'll secretly know it's a tree; do I have to avoid "going looking for it"? I like your idea of starting by making things fuzzy. I'll play with this next time I'm bored in the garden.

...

One time I imagined that corporations had an independent being (like spirits/demons) and were possessing the employees and buildings . . .

That's good. The corporation as egregore/servitor. Probably truth in that. Interesting to actually get yourself to see things that way, though.

The void that I started to see in people's eyes began to creep me out, as did the weird feeling this created when I would walk down a street.

Shows how you "fill in" the idea that there are "actual people" inside the bodies you pass by every day. But really, you don't know. (Philosophical zombies! [https://en.wikipedia.org/wiki/Philosophical_zombie])

...Look forward to that. It seems that maybe when you "externalise" anything (basically, declaring it not under your direct control now) it takes on a bit of an independent will of its own. Basically like little servitors or spirits, but it could go quite wrong quite quickly if you're not grounded in yourself. ("Schizophrenia here we come!" again.)

This post [<http://www.chaosmatrix.org/library/chaos/texts/fotamec2.html>] - on the sigil/servitor Fotamecus for time compression - is what brought that thought to mind. Once something is out there, it can become its own thing. I'm not quite sure how to integrate that stuff into the 'subjective reality' worldview as yet.

Reversing heavy othering requires understanding othering, and having the heart to reverse it.

Servitors can be recalled and reabsorbed, but once you've created something that's expanded almost into a world, then it's a more daunting task, of course. Maybe more of a reset.

POST: Death

[POST]

How well do you personally know death? I've been so well acquainted we've shared conversation in dream. Everyone has met her and known her realm. We've all been there before we were us.
Death is a big thing. Friends all.

[END OF POST]

I love this topic. But what makes you think you aren't dead right now?

Because he's God, and God is eternal. Of course.

If everything in God is life, where does the idea of death come from?

Duality. We are so used to the dichotomy of object/space, existance/nonexistance. We cannot comprehend 'oneness' and 'eternity'. The idea of death comes from the temporary nature of appearances.

Where does duality come from?

Good question. The sense of here and there, from the identity we accumulate gradually from birth and from language, from the tendency of our 'attentional profile' to become 'clumpy' and jump to objects instead of spaces?

Duality is inherent to all cognition. Even non-duality is known only in contradistinction to duality.

Ah, nice. All words imply a surrounding space, implying an "other". Language guarantees seeing the world in terms of dualities.

Language / Beyond language.
Duality / Non-duality.
Conceptual / Non-conceptual. <-- this distinction is a concept, btw.
That which is beyond duality is also beyond ordinary cognition.

A-ha, I like that. So, maybe also: direct experience vs thinking-about or conceptualising.

==Well, "direct experience" suggests that there is indirect experience. But experience is always direct. Self-limited people have direct experience, not indirect.

The contrast is between, say, actually feeling the space in the room or experiencing being vastness, rather than thinking-about it. When you talk to people about this stuff, sometimes it's hard to get them to actually use their awareness, rather than just play with the concepts. Took me a while on that score.

Of course, thinking is still a direct experience - of thinking!

Much better than possibly implying people have indirect experiences.

Yes, all experience is direct, it's a case of: what is the nature of that experience. To realise what's going on, it's a matter of directing your attention to the right place. Experience is experience is experience. There can be no indirect, when experience is made from you.

And this amazing "thing" that people could be feeling, this undefined timeless place which is the site of experiencing, it isn't far away! It's closer than the veins in one's own neck. It's all right here.

Right! Intimate is the word!

Closer is He than breathing, and nearer than hands and feet - Tennyson

People spend years meditating and following this or that path. All of that can be fun, but it is not necessary. You can simply direct your attention to where you are looking from, and see that it is capacity for everything.

NOW you are talking. This is my favorite kind of George. :)

In a way, there's nothing more to say than that, once you've got it.

Well, that's just brilliant, and this combination appears new to me. I haven't heard it said exactly this way before.

I think I probably nicked the term from Thomas Traherne and his idea of a metaphysical space, but there you go. It fits.

Every time I go for a contemplation... Here, let's cheat.

I know what you mean. Playfulness, yes. Insanity one I'm interested in. Also, art and magick and awareness are inexplicably bound, exploring the creative process, combining the two, all that.

Our minds are infinitely creative. You don't have to work yourself over to become creative.

This is bang-on true. In fact, people applying effort to creativity is what prevents it. People try to keep busy doing stuff thinking this will make them more productive and produce more ideas. But that's not true. What you have to do is, clear space for the ideas to come. Or should I say, allow space. Creativity is the rule!

POST: On timelessness and age. (by cosmicprankster420)

[POST]

it seems a lot of humans get worked up over the concept of age, how long ones meat body has been in operation. Something i have pondered is the idea of being timeless or eternal, not defining ones self by their age. For some reason my birthday is coming up in a month and today i was mildly distressed about turning 27 mainly because i haven't accomplished that much in the material world in terms of jobs and mates and so forth. Even though i have graduated college and have a completed fantasy novel manuscript, there are so many ways this golf score we call our age binds us to the material world and reduces lucidity. In addition to not associate with being human, i've began to realize what makes us humaned or what binds us to the material world is the ticker of age, this scoreboard that defines our worth in this materialistic society. Associating ourselves with our age seems to make us hyper aware of our physical human bodies, and i believe i want to transcend that by not identifying with my age and instead think of myself as eternal, timeless, outside of time, never born. When that ticker becomes insignificant it seems much harder to be attached to this particular dimension and harder to associate ones self with being human. Why should our dream be defined by a score we call age, i just came here to play the game and have fun. If we move the metaphor from dream to video game, its like materialists are those gamers who get way to frustrated in world of war craft and associate their self worth with there score in the game, when being lucid makes you say "dude, its just a game, chill out".

[END OF POST]

AesirAnatman: I'm glad you posted this.
It's interesting because about a week ago I was asked by some document I was filling out how old I am. I sat there for a good minute asking myself 'am I 22 or 23? I'm not sure' until I did the math for the years and figured it out. I realized that conventionally this is a very weird question to ask myself.
Age doesn't matter much to me because I've stopped identifying and caring about that aspect of my humanity. This extends beyond occasional forgetfulness of my own age - I never remember the ages of my friends or family or their birthdays. Stranger yet, when I interact with children or elderly people, I basically treat them as I would anyone else. I don't baby children (and often have ended up bringing out incredibly intelligent aspects of kids simply by treating them as such) and I don't try to appease the elderly. Granted, this isn't entirely true with me with the elderly members of my own family at present, but is basically true otherwise.
there are so many ways this golf score we call our age binds us to the material world and reduces lucidity.
YES. Right now I'm trying to learn to live ultra-minimally so that I can live in a van in order to not need to work very much. However, I'm still going to school for a CS and Philosophy degree in order to pursue a career even though I have no desire or intention to have such a career more than 2-3 years max. I want to have graduated college, with no particular benefit to myself.
i believe i want to transcend that by not identifying with my age and instead think of myself as eternal, timeless, outside of time, never born.
I feel this desire as well.
its like materialists are those gamers who get way to frustrated in world of war craft and associate their self worth with there score in the game, when being lucid makes you say "dude, its just a game, chill out".
Hahaha, I feel this way so often.

Good post. @cosmicprankster420 & @AesirAnatman:

Bringing the magickal aspect into this though: If not things, or a career, there are experiences we'd like to have, I guess? And situations we'd like to be in, and situations we'd like not to be in.

There are two approaches, and I reckon making the decision early as possible is best:

- With Plan: You can select what you want and start adopting it as your reality now (magickal techniques; Neville Goddard; etc). This is the Deity Dreamer approach: This is all your reality, under the control of your imagination.
- Without Plan: You can commit to staying relaxed and open and paying attention, deciding that you will always follow your intuition and the synchronistic opportunities that arise, no matter how you feel. This is the 'True Will' approach, or rephrased: that you already always know what you want in ways that you can't consciously think, but you'll know when to act when the time comes. Intentional purposelessness.

Either one is a form of commitment and works. Half-baked versions of either mean you just get bounced about. I've jumped between the two, and it confused things. (In college days I spent loads of time thinking and reading about relaxation, self-mastery, philosophy and magick and not them putting them into consistent daily practice and exercise or really paying attention to what I actually wanted, flip-flopping. I could have saved myself a lot of messing about.)

i believe i want to transcend that by not identifying with my age and instead think of myself as eternal, timeless, outside of time, never born.

That's great. However, you have to recognised that you will have the experience of being a particular bodily age and so on as 'time' unfolds, and you should plan to deal with that, in terms of what you 'intend' and the situation you want to be in. Better to be in that nice house with a pool and staff, than not.

"dude, its just a game, chill out".

If only there was a handy strategy guide! [<https://www.oliverremberton.com/2014/life-is-a-game-this-is-your-strategy-guide>]

I mean, it's always going to be better to: a) be a millionaire before 30/35/40 whatever than not, and b) to start doing things you love, with money coming from that, sooner rather than later. And if you're not really interested in CS/Phulosophy or want a career in it, but really want to be an actor, then do that now - etc. Otherwise you'll never get the \$10M blockbuster action movie payday while you're still young enough to pull the moves and the ladies*. :-)

The materialism/idealism, waking/dreaming, reality/illusion philosophy or practice doesn't really change any of that, since they are about experiences. Whether you do it by old-fashioned means or by magick, you still have to make the choice.

[Amend as required]

POST: Confessions

On Fearlessness

Hmm. How to assist this state? One of the benefits of recognising that you are not 'this body' but are the whole dream should be the recognition that the whole dream moves with you towards your goals? And that apparent fears are anxieties arising from not completely embracing that viewpoint.

This may have a side-effect though: That any efforts of manipulation that imply that 'you' are separate from 'the environment' might reinforce a materialist view of stubborn not-me resisting change.

Another approach to releasing fears can be to simply to do a daily exercise where you lie down on the floor and just leg go of yourself, body and thought - basically, "play dead" and let things move and unwind by themselves. You'll find that a lot of fear is held as 'defensive tension' in the body with co-located thoughts and feelings. They gradually release and work themselves out over time if given the chance.

Actually, on exercises: Does anybody have particular daily practices they'd like to share? (S.R. or magick-related ones, I hasten to add!)

...

That's why you should have continued! That's the point! It's initially a bit daunting and can be unpleasant though: all your defences are being deleted/released, after all. The process is usually relatively gradual overall but can be very "bumpy" - as in, things might be quiet for a while and then there's a big release.

Edit: Isn't your response at odds with your being-a-deity post?

The thing is, it is scary. You are opening yourself out to "become the universe" - it's the thing all those non-dual and buddhist efforts lead to: identifying yourself with the wide open space of awareness and all its contents.

As soon as you do it, you become aware of all those bits and pieces you have generally been avoiding. And you just feel completely exposed. I guess that's why there's much talk of "faith" and so on. You only realise how hard you are holding on when you try to let go like this.

People who start doing mindfulness, for instance, are often surprised to discover they feel a bit worse when they begin! But then those feelings dissolve into the surrounding space. There's an interesting book by Les Fehmi called Dissolving Pain which has techniques for this; they are applicable here too. In fact, lots of magick/help approaches essentially boil down to the same thing.

There's a book called Busting Loose From The Money Game by Robert Scheinfeld (cheesy website here) basically written as a business self-help book, but in actual fact it's based around a "process" of dissolving "discomfort eggs" as they arise and releasing their energy. In other words, mindfulness and dissolving your reality into openness.

"become the universe" .. It's beyond that even.

Yep, so language update: From now on, let's have "universe" mean "all the objects (content)" and "place" or "ground" of awareness be the vastness with all its enfolded infinite possibilities.

We're talking about the same thing.

But what's interesting is that there are ways to express the same thing that will make people slightly afraid and recoil. And ways that will make people giddy with fun and joy.

Yes. It's a lesson to learn: when you talk to people about this stuff, you have to begin from their worldview and build outwards, leading step by step. That's why there are so many, need to be so many*, ways of saying the same thing.

I don't like this, because it tries to homogenize possibilities.

How does it? We say that "you" are the open infinity, and the "universe" is the temporary objects and processes and observations arising within it.

Only in your mind. Your level of expression hides too much. Fuck people over with insight! Slam them with truth. Maybe not always, but sometimes.

Heheh. But the thing is, they won't understand you if you don't start from their current concepts! I don't mean you start by agreeing with them, only that you begin with their terms of reference.

Your language update redefines the universe to be something completely distinct from how people typically use that concept.

Hmm. Well, maybe it's a word best avoided. I usually use the word "world" anyway, to refer to the "appearances" we experience. It reduces scale to what we're directly experiencing, and makes the bridge to "dream-world" easier. And you can indicate to people how to 'feel the background space' from there. "Universe" is too abstract actually.

You'd be surprised.

Actually, I'm with this to some extent. You don't necessarily need to walk people through from scratch, and you have to 'feel about a bit' to find where to start from, adapt as you go. Assuming the best and tuning is a good approach.

Eh, the word "world" again implies internal consistency...

A "world" does appear to have those things, like a "dream-world" but it's easier to think of it being illusory, and "hanging in space". Or I find it easier anyway. You can literally sit people down and say, 'what do you see?' and then show them that their current experience is limited and sits inside a vast open place. I mean, all this depends on who you're talking to of course!

Of course, I'm only teaching myself!

They are, of course, not so much "inside a vast open space" as rather "inside me"... Ha. Well, lack of confidence in my ability to communicate it, perhaps. This may indeed be true. But in both ways!

To understand and be understood. :-)

It's a trade-off that you can balance out later. Not so the other way. But, yeah, it's something worth considering, particular with non-face-to-face discussion.

POST: Investigation of the utility of dream manipulation

[POST]

Dreams have long been used as a form of divination, either as glass through which higher powers are seen darkly, or an interface with the subconscious mind for self understanding. What else can dreams be used for? Herein, we will attempted to break the possible applications of dreams into two primary categories:

1. practice of skills under non extant conditions, and
2. practices of skills that cannot, or do not, exist. Subdivisions of each are explored and reveal a host potential uses for dream manipulation.
I do not wish to deny the potential of divinatory dreamwork, but since they have been long explored, I instead wish to strike fresh ground.
The most obvious feature of dreams is that they are a natural (non-drug induced) nonrational form of cognition. Many studies exist that suggest that dreams are a way for the brain to integrate experiences, and to undergo simulation of various experiences without risk. Interestingly, a study was done in which participants practiced a skiing video game. Those who practiced it shortly before sleep learned at a faster rate, and many reported dreaming about skiing.
It thus seems that dreams allow us to practice skills, and retain some improvement from this practice. Further, given the existence of lucid dreaming, it is possible to practice under conditions that are not physically possible, or to practice skills that could not physically exist.
Let's examine these two possibilities separately. (1. practice under non extant conditions, and 2. practices of skills that cannot, or do not, exist)
The former could be of clear use for practicing under dangerous conditions that could exist, but have not yet occurred. Anecdotaly, many people who engage in athletics report that first visualizing a task before attempting it results in better performance. It certainly appears that way for me in regards to difficult tasks of fine motor skills, such as playing a difficult passage on piano, or drawing a long curve of relative complexity, and for gross motor skills, such as vaulting objects, and safely landing from a height.
A subcategory of this conditional practice involves conditions that one does not expect to participate in, such as special cases of physical rules (modified gravity, or friction), or even extremely unusual topological circumstances, such as higher dimensional locales, in which one can move away from a position without apparently moving in the three directions most familiar to us.
The utility of this subcategory is not as immediately obvious in “waking life.” It can, however, be vital to effective fiction writing and the creation of video games. Further, if memories do entail the formation of neural connections, and there is transferability between skills, then these “impossibly practiced skills” may provide insights into physical practice that would have been much more difficult to obtain otherwise.
Now we will continue on to the second of the possibilities, the practice of skills that cannot, or do not, exist.
The first form of utility in this category that comes to mind is that it may exercise abstract thought. In undergoing experiences that cannot exist, one must create them oneself, and thus creative, and likely critical, thinking will be involved.
The range of environments that can be imagined is far too large to list, so let's devise some categories: literal, symbolic, neither/both literal and symbolic.
3. Literal
Literal environments that are not possible refers to “physical” environments that are not possible. This was touched upon in the practice of skills under conditions that could not exist. The same essentially applies here. Only in dreams can one hunt the Jabberwock.
4. Symbolic.
In this category we will find ideas that represent something other than what is sensed. Language, games, mathematics, and allegory, lie here.
Lived hieroglyphics, while potentially possible with augmented reality, are currently not a reality. The ability to communicate directly through the creation of symbols of meaning or desire with more dimensions than typical speech is possible within dreams. Words can change color. A single person can speak in counterpoint, the precise melodies and species containing relevant information. A person can be surrounded in meaning in a way not currently possible. The environment itself can speak, and change form in linguistic meaning bearing ways based upon what is happening.
Games that are not possible in real life can occur in dreams. These might include games like Hesse's Glass Bead Game, or could perhaps be even more abstract. Imagine a game in which one must navigate a whirling house party of uncountable rooms by changing the demeanour of each room into something congruent with a sphere of the tree of life, in attempt to create a sequence of rooms akin to the tree,
It is already common for people to visualize mathematics, so that is not new here. Instead, one can live mathematics. While in mathematics it is possible create rules for a system without regard to its physicality, here the impossible physicality may become manifest.
Allegory is often employed in the use of dreams for divination, so it does not need any more investigation here. Simply put, forms of symbolism already internalized may be lived out in dreams, and thus one may further develop modes of symbolic thought through ritual in which the effects are much more pronounced.
5. Neither/Both Literal and Symbolic
Here there are two categories, 1. environments that are both literal and symbolic, and 2. environments that are neither literal nor symbolic.
6. Environments that are literal and symbolic abound in literature. A “real” world exists within fiction, but it often also contains a higher order discourse that uses people and places as its fundamental carriers of meaning.
Environments of this sort would entail an apparently physical locale, in which every physical action incurs a symbolic response. Cutting down a tree both results in that tree being felled In the “physical world” of the dream, as well as attacking whatever symbolic associations that tree held for the dreamer.
This is often little different from ritual in folk circumstances as evidenced in Frazer's Golden Bough. For example, Frazer writes of a range of traditions in which the last person to reap their crop is said to have “taken the old man,” “become the old man,” or “killed the old man.” This unlucky soul then undergoes various unpleasant treatments for working more slowly than the others. This may include being wrapped up in wreathes of corn and beaten, or simply having to host a party with free alcohol for all comers.
7. Neither Symbolic nor Literal
From a rational perspective, this can be interpreted as meaningless. If a sensory impression holds no literal meaning, and it holds no symbolic meaning, where can it hold any meaning?
To employ a Joycean distortion of language, “information” is “in-formation.” Sensory impressions that are placed into formations have already been placed into a system, and systems, being created by consciousnesses, impose meaning. Of course, many systems can be placed over the same data, but a multiplicity of meaning does not deny meaning.
Therefore, it would seem that only pure, undifferentiated, sensory input can be meaningless. That is, it is only meaningless if no thought is made about it, if it is not organized in any way, or put in reference (in formation) to something else.
It could be argued that the mere presence of sensory information is itself information. The fact that a sound is a sound, already means that a system has been placed over it. The same can be said for all of the other senses. For a sensory input to be neither symbolic nor literal, the person sensing must be unaware what sense the input goes with. If the sensing person is aware what sense is employed, then it has already been categorized.
Further, the fact that something is sensed in the first place is a category! It is a distinction between sensed, and not sensed. No continuum can exist here. If it is partially sensed, then it is still sensed, but one has imposed further information onto it, namely that there is something unsensed as well.
If one wishes to state that something can be both sensed and not sensed, and not in some partial fashion, but in its entirety, one is still categorizing it, namely into the category of being sensed and not sensed.
If we assume that something lies in fault with the above, it remains unclear what benefit there is to experience that is neither symbolic nor literal, experience that holds no meaning, not even the concept of meaninglessness. If possible, it may be a way to simulate death, depending on the nature of death, and thus prepare themselves for what is to come, but given that view of death, time is limited, and might not be best spent practicing what they are guaranteed an eternity of.
...
It is apparent that dreams may be utilized for many purposes, though some theoretical categories appear to be neither possible nor desirable. With the development of virtual/augmented reality and designer drugs, some of these categories may become accessible in “waking” states.

[END OF POST]

Interesting post, but I think it might be more suited to /r/LucidDreaming or a subreddit about dream interpretation. This forum is about subjective idealism, as Nefandi mentions, and so is more about the dreamlike nature of waking experience.

Check out our Reading List if you want to find out more, get the perspective.

Whether or not "everything" is "unreal" in the sense that you mean, my points about the uses of unreality apply. It just happens that my points apply to a larger category, if subjective idealism is closer to the mark than materialism.

Details about a speaker do not determine the value of what is said. If Hitler said "exercise is healthy," the fact that Hitler is the speaker makes no difference to the truth value of the statement "exercise is healthy."

Of course, exercising didn't do Hitler much good in the end!

Yeah, everything ends.

He should have stuck to making 'keep fit' videos, made a fortune, retired to an Austrian village in comfort. This may in fact be a way around the "can't kill Hitler" problem in time travel...

Now we just have to figure how to send that message to the future...

...so that the instructions can be followed in the past. Maybe in spring 2015? (Comedy-gold)

...

That's not even the main problem. Nethodsod is not espousing subjective idealism. It's obvious he's a materialist. He doesn't understand that this world is an illusion. He thinks some shit here is real and there are molecules and atoms and shit. And brains with chemicals in them. Basically, from a subjective idealist POV he's completely clueless and his points have no worth at all. He's not showing how everything is unreal or how to get in touch with unreality. He's clinging to convention with every line he writes. I can tell he's scared more than any one of us here.

It is really the main problem. From a lucid dreaming perspective it's all good; materialism vs idealism doesn't really matter. It's just that this subreddit isn't focused on that.

That's only true if you're talking about lucid dreaming as a secular, non-yogic activity, then I agree.

Agreed.

Yes, in retrospect, this post wasn't a great fit for this sub. I was acting under the impression that lucid dreams were expected to be a tool for realizing this unreal nature, and thus figured that an investigation of the uses of dream manipulation would be helpful.

No worries! It's great to know that thoughtful people are interested in contributing.

The idea is here is that your dream and waking life are a continuity - both consist of 'dream images' with no hidden underlying solid substrate - appearing in the common background of your awareness. What they are beyond that is another thing, of course. Certainly, lucid dreams can be great for rehearsal and a host of other brilliant applications, as well as exploring your 'base'.

However, fundamentally the hope is that you might be able to apply your lucid dreaming abilities more readily to waking life (in a "magickal" sense) than is commonly assumed, if you truly accept subjective idealism and operate from it. An additional benefit (for some, the key benefit) is a recognition of your true nature and place in the world, and the nature of that world, as a 'good' in itself.

That's why the reading list is a strange mix of dream yoga, chaos magick, lucid dreaming, personal investigation and philosophy!

You know, I don't really disagree with anything you said. I used to be a very hardcore subjective idealist. However, I have since become agnostic towards the issue. That is, I don't think we can know if anything exists beyond our apprehension (noumena being what is "really real" in philosophical jargon). From that I decided (perhaps not for the best) that it is typically to one's advantage to act as though a physical objective reality exists, even if it does not.

On the other hand, I do practice magick (hermetic informed chaos magick with an emphasis on ritual in dreams, and the creation of egregores/servitores/whatever to personify parts of the mind). And I do think that the observed world (whether or not something lies beyond it) is completely mind. Thus, at least that observed reality, if not "absolute reality," can be manipulated by intent.

What I don't see the value in, is making "waking" life completely like what is seemingly a dream, even if both are hallucinations. Again, that's a result of my "acting as if" principle.

I think 'secret agnosticism' isn't a bad thing either. Thing thing is, 'waking life' does act "as if" there is a background, but it turns out to be flexible: it does adjust to your beliefs and expectations and intentions. Since 'dream world' is the most flexible possible approach, and the most relaxed approach, that is to the benefit. In a way, it's much like magick traditions that all, in the end, teach you to work on yourself and reach 'realisation'. The world does seem to try to respond "as if". There's no such thing as a servitor as such, but the world will respond to you as if there were.

The difference between the waking world and the dream world is really the depth of the establishment of habits. The waking world has been around a lot longer than any dream you're going to have, and has stabilised. It is still potentially semi-unlimited (it is just mind-imagery) though. However, the 'will' or confidence or commitment-to-worldview required to make things happen is much greater. Hence the 'Dream Yoga' style effort (if you've not read Tenzin Rinpoche's book, it's worth your time, and is "available"). I understand your 'objections' though.

Also, something that occurred was, all waking imagery is essentially symbolic too; it represents "meaning". This is something I should have taken from your post.

It is not clear that the Buddhist notion of emptiness is equivalent to "lack of substance."

I've always taken this to be that there is no solid underlying. That the world is an illusion not because it is not a real experience, it is just that the nature of that experience is not what we assume.

One examines the cup of coffee before us, and realises that it has no solidity: it is a floating image, with occasional other sensations when we 'touch' it, but nowhere can we find the 'solid cup of coffee' we imagine. Then we turn our attention to ourselves, and find that we are not solid either: empty space with the occasional sensation floating here and there!

That's my understanding at present anyway.

That's a common one, but it is also applied to other things as well. In Confucianism, the idea of self is "relationally constituted." That is, you are the sum of all your connections to other people (and maybe the state, nature, and "heaven"). This fits in well with the idea of emptiness, and for some Confucian Buddhists, allows for emptiness as no-self to exist without completely leaving behind the material world. Many Buddhists are closer to dualists, thinking that there is something physical in addition to something nonphysical. Buddhism is one of those weird systems that is very open to reinterpretation, having few core beliefs. Given that everything we "understand" is illusion, from this point of view, everything can be reduced to utility, rather than "truth," since all things will be false in some since. This utility is very "Utilitarian" in that most Buddhism involves ways to reduce suffering.

I see. Buddhism seems quite 'scientific' in some of its forms, in the same sense as this. It seems to have a 'practical' aspect that works with its flexibility.

In truth, with idealism there is nothing to say that there isn't an underlying 'X' that 'inspires' our sensory experience, it is just inaccessible and cannot be commented upon. It has to be inferred by the restrictions and limitations we observe. In that sense they cover the same ground.

...

If we assume there is no material world, how does it immediately follow that desire is the only element involved in manipulating hallucinations? Further, it is not desire in general you suppose, but "desire to hold on to the hallucination."

Might there be hallucinations that we do not desire, but seem to arise nonetheless? It is certainly not inconceivable, and thus cannot be assumed an impossibility until demonstrated as such. Then there is the issue of the degree to which unreality is consensual. Do the thoughts of others influence our own thoughts? Do we interact with others at all? Berkely, for example, (a well known subjective idealist) thought that God was all-seeing, and thus kept "unreality" stable. Of course, none of the above matters if you wish to throw out the idea of rationality altogether. However, at that point, anything goes, and there is no-thing to be obtained or lost.

Some good points. "The rope and the snake", for instance?

And, certainly, it doesn't follow that belief/expectation are the only things at work. If this is, say, a 'shared dream' then there's more to it than your personal belief. As I say elsewhere, one difference between waking and most dreaming is the longer-lasting nature of this waking world, and it's potential to have amassed 'habits'.

I say "this" because this is the 'default' world we seem to return to. In fact, it might be better to call this our 'base dream'. I'd say there is no difference to the way waking and dream realities are built and behave, but it might be that dreams build up 'habits' and 'solidity' (really: predictability and self-consistency) over time. And since our base dream is longer lasting with more active dream characters, it has stabilised to a great extend. This is why most magick seems to occur via 'useful coincidences', even if incredibly unlikely. It is rare to directly observe a discontinuity occurring.

Is reality consensual? Berkeley's problem is that he implicitly imagined that there was in a sense a three-dimensional space, but the people in it were only observing certain areas of that space - and that things outwith anyone's observation might 'go blank'. However, there is no such 3-d space. If you examine your own experience, you'll find that there seems to be a "vast unstructured place" where your experience arises. Within that, you experience a 'phenomenal space", a structured space with sensory experience, and other parallel 'ideational spaces' where thoughts are (although sometimes they might seem to be located in the 'phenomenal space' somehow). The alternative view is that the whole world is enfolded into the perspective you are seeing now, and moments unfold then enfold into the background one by one. That way, the whole world is always under observation, or 'within mind', and nobody is 'spatially located'; everyone is everywhere or rather, everywhere is within everyone.

Summary: There are some things that need to be understood by experimentation and contemplation.

The enfolded/unfolded idea is well described in physicist David Bohm's world-view of an explicate (what we see) and implicate (which is enfolded) order.

The hologram analogy applies to a limited extent: if the whole image is contained within each part of the image, then looking at any part of the image at all is to look at the whole - this fulfilling the requirement that the world must exist within consciousness at all times (= be "observed" in the most general sense).

I'm pretty flexible on interpretations; to an extent it comes down to "practicality". However, I am keen on a commonality of viewpoint between dreaming and waking, intention and magick, which I think is achievable.

Also, I don't why thoughts can't have nonspatial dimensions to them that we reinterpret into spatial dimensions.

We do have an ability to think-about. For instance, under hypnosis people can experience "square circles" and so on, because you are not necessarily bound by visual and dimensional restrictions. (You don't need to by hypnotised, you can just do this, but you'll find yourself reluctant to let go to it.)

...

*Q1: Here's a direct quote from the sidebar about the stated purpose of this subreddit:
A place for subjective idealists to discuss how to get in touch with the deeper unreality of this world...*

*Q2: I suppose you are right, that wasn't directly on topic. I was under the impression that dream manipulation in general was a tool toward this end.
If what is dreamt and what is typically called "waking life" are essentially the same, then everything in this post should be equally applicable to the unreality of the dreamt and "waking" worlds.*

Except perhaps the 'stability' factor?

POST: This is something I am contemplating currently: Stability.

In other words, intent, I now realize, has a clearly effortless aspect. I would even say that true intent, deepest intent, is always effortless.

Yes, I completely agree with this.

I wonder, is the "replacement grounding" required for a sense of stability possibly the consistent sense of identifying with background awareness, rather than any other aspects of personality or objects or whatever? If everything else is going to be changeable and transitory, all that's going to be left is that background; it'll be the only thing to hold on to.

I haven't tried thinking of making background awareness my home base precisely because it doesn't look like anything, it's like I don't know what it is...

I think its property of "always there-ness' despite having no form is why it's potentially good for grounding / identifying with, whereas intent is content (loosely) and so changes.

In one dream I've had my legs cut off and I didn't even blink... I've had dream environments disappear or drastically change...

But, you did know you were in a literal dream (i.e. lucid dream) at the time. Your ("real") body screams for its existence when it gets in danger; you'd be amazed how much it likes being alive (as we judge it). I have in the past assumed I would get to a stage where i'd not care, but then went beyond it and was surprised how... well... fighty it all is!

I still like intent better. :)

You can have both, because the content is made from / shaped from the background. So it's more a case of focus, I guess. Anyway, it's something to play with.

Actually that's something I am working with right now too...

Well, start with low-speed impacts first, yeah? ;-)

POST: Why is Oneirosophy Good?

[POST]

I'll start by saying all this sounds cool, but I'm curious why it is a good idea.
Why is it good to "feel like [you] are in a lucid dream during waking reality?"
Is there some specific reason people should do this? Is there more to the ideas here that I'm not getting? Is there something that one might gain from this way of approaching the world/reality?

[END OF POST]

The extra part of it is the "magick" part. If you've had lucid dreams, you come to a different understanding of what influence or intention means, and what "you" are, and contemplation of what this all means in waking life leads to some interesting ideas. Bits of this were brought up in other threads, but your notion of yourself becomes everything that you are experiencing or that which experiences and your notion of doing something - anything! - means changing the universe. You are performing magick

every time you make a decision. What's more, the more you take on that worldview, the more it appears true. And this is important. When you change your view to see waking life as a dream, it will become more like a dream for you, in all sorts of interesting ways. The expectation is that the further you push this, the more flexible things may become...

But, there's still the issue of intersubjectivity. For which I should start a little thread soon...

I am quite familiar with magick, primarily of the hermetic and chaotic varieties. I've also been lucid dreaming since I was a child. I'm still lucid in cycles (weekly or monthly cycles) without putting any effort into it. It eventually became somewhat boring for me, and now I find non lucid dreams to be more beneficial, since the subconscious wellings are less mediated by intention. So you claim that "you" are what you are experiencing, and that you can control what you experiencing, so you can change yourself? Or do you mean something like Crowley's calling every intentional act an act of magick? Why is it good for your life to be like a dream? Why should you want things to become "flexible?" Are you imagining something like pure intent manifesting desire?

My interest in lucid dreaming also came and went, although has returned. I stopped fiddling with them in the end, more enjoyed the experience unfolding as an observer more; it became more of a philosophical playground.

Non-duality + chaos magick, perhaps as a summary, but the Crowley quote works for me.

Flexibility in terms of free will for your own behaviour, for lifting boundaries for magickal work (what belief could be more flexible?), but primarily for clearer direct perception of the present moment perhaps.

Note: Of course, this is meant to be an exploratory sub for generating ideas as much as anything else - how far can you push this particular idea and what are the effects if you do? There is to be some fun involved.

What do you mean by non-duality?

In its simplest form, the dissolving of the experience that you are 'here' and stuff is 'there'. It's a perceptual thing, rather than a thought thing. (Many-valued logic does look interesting though. I've heard the sea battle paradox before.)

That's kind of what I was asking you! I'm not sure why direct "perception of the present moment" is desirable.

Maybe it'll just be really cool? ;-) Increased freedom of will would follow from clearer perception, I suggest. But the real point of this sub (which isn't mine actually, it just looks interesting) seems to be a question or two, not an answer: what would it be like...? what would it mean philosophically...?

Ah, you see, I figured oneirosophy would have a goal, even though it moreso appears to be a toolset. Sort of like how gnosis is a state achieved for a reason, though its uses are varied. I hope to some some interesting material come of this board!

Well, the extra question is... what can you do if you make this a dream? If you adopt that belief so completely that you experience it, as in chaos magick.

Well, let's hope so!

Beyond the question of what, are the questions of "why?" and "should I?"

Indeed. All to be explored. Or... not, depending. This is interesting though. What are your concerns about this approach?

Well, the main one is that you might not be able to reverse any undesirable changes you make to yourself. The higher order problem is of knowing what one should use these techniques for. In many eastern religions, these techniques are used to attain something called "enlightenment," whose nature varies from culture to culture. But essentially, the goal is to be happy, or at least to avoid suffering, and in Buddhism, this is largely accomplished through not feeling attached to things. Unfortunately, if we think about the character of the person who is merely content, and does not care about anything, does that seem like a "good" person. I certainly don't like being around those people, and don't want to be like that.

It is true that changes would be irreversible, even just because of the memory of the change.

Enlightenment, as I see it, isn't about being happy (although that may come), it's about realising there is no division between you and your environment, that there is no "you" as you conceive of it - rather, you are "the space in which experience arises". (Try Douglas Harding's experiments for a fun taster maybe. [<https://www.headless.org/>])

This is different to not caring or being content. In fact, it doesn't necessarily reflect on your character at all! There are plenty of grumpy, smoking, drinking enlightened people. Rather, it is simply seeing what you actually are.

This then leads to experiential subjective idealism, and from then to a more direct approach to magick. Is the idea.

POST: How I have changed my core beliefs throughout my lucid dreaming career.

I was excited to have this thought but also angry that I didn't think of it myself and needed some stupid book to remind me. I always feel like that about great ideas, lol. I feel ashamed that I didn't already know them on my own, how dare I not know them?

Of course, if this is a dream, then you created the dream book to tell yourself about the dream nature of your reality. So really, you did think of it Yourself, just not yourself. ;-)

Random quote to end the day, since it seems appropriate to this and the other thread we're running [POST: What is Oneirosophy?]:

==In my first twenty years of lucid dreaming, as I came to seek an ultimate or base reality beyond symbols and appearance, beyond dream- ing and lucid dreaming, something deep within allowed the awareness that enlivens me to experience the "clear light" of pure awareness (as described in chapter 7). After exiting that experience, I knew that each dot of awareness, each speck of aware light, existed equally with all others and equally connected to all others. The awareness of the col- lective could be accessed in the awareness of the tiniest speck. From that moment, I sensed that behind all appearances an un- paralleled, profound connection exists at a deep, deep level. Beneath each experience lies a connectedness. Behind each life, each object, each action, an awareness exists joined to all other life, objects, and actions. The inner working of all this awareness spills out into a reality formed and experienced and connects all in a massive symphony of individual creativity and fulfilment. In certain moments, if you allow it, you can sense that the world around you is deeply interconnected: the sound of this bird is connected to a neighbor opening his door, the wind rustling the leaves announces the car appearing around the corner, your brief sudden thought of a friend lies in synchronicity with an action hundreds of miles away. The thought, the wind, the car, the bird, all connect at some deeper level where awareness resides, intersects, creates, and fulfills. Behind all ap- pearances lies the movement of awareness.

- Lucid Dreaming: Gateway to the Inner Self, Robert Waggoner==

...

There's also a tendency for people to "forget" unusual experiences. The just don't get attached to the rest of their memories; they let them go. I actually found it hard to stick at lucid dreaming initially because daily life would quickly 'overwrite' the feeling and disconnect me from it, then I'd 'wake up to it' again.

If you just relax and ignore your dreams, your dream rules can remain the same throughout your human lifespan or they can drift around a bit.

Just as in life. If you never consciously 'intend' or 're-intend' (either in moving forward or resisting a direction) then you and your life environment (the same thing) will just play out automatically. Many people don't realise they can direct themselves; they just experience themselves. Hence all that talk about 'karma' in various writings; really I think this can be viewed as just clearing out 'bad intentions' (or directions) I think.

I think we can be mostly automatic - once we make our occasional intentional adjustments we can let them run - but if you make none at all, you're in trouble. Particularly because external events will, if you don't 'stay awake', adjust your 'character' and implicit direction, and send you off to the wrong place. A main thing in all this seems to be, at a minimum: pay attention and always listen. You don't necessarily need to interfere, but you need to be aware, and do a spot of magickal intention to counter 'drift'.

Nefandi means well. This kind of thing.

There is one warning regarding this practice: it is important to take care of responsibilities and to respect the logic and limitations of conventional life. When you tell yourself that your waking life is a dream, this is true, but if you leap from a building you will still fall, not fly. If you do not go to work, bills will go unpaid. Plunge your hand in a fire and you will be burned. It is important to remain grounded in the realities of the relative world, because as long as there is a "you" and "me," there is a relative world in which we live, other sentient beings who are suffering, and consequences from the decisions we make.

The Tibetan Yogas of Dream and Sleep, Tenzin Wangyal Rinpoche

Some people can get pretty lost in this stuff, because on the one hand it works (intention via subjective reality worldview does have effects), but on the other hand there are limits and dangers.

On communication, you only need to take a look here on this very sub to see how challenging it is to refer to what you individually assume are straightforward concepts - because different words mean different things to all us different Humpties, just as you say! Especially when you are talking about experiences.

Consequences are important to consider, particularly if there's a risk that other people will be directly affected without their consent, collaterally. Part of the purpose of this subreddit will be, I hope, to explore those issues too. There are practical, philosophical and moral implications here. Subjective idealism is not solipsism. If you are right-handed, do you happily use it to cut your left hand?

Lack of consent is hovering perhaps highest amongst the top of my issues now having pulled the corruption alarm cord. I am very concerned about malevolent corruption of innocence as a result

I think that so long as you don't explicitly target a person with your intentions, you're okay. Why would you pit aspects of yourself against one another anyway?

It is true, however, that there is no filter: if you magickally intend something it will happen in some form or other, regardless of moral aspects and so on. However, how 'the dream' manages and combines the different intentions of everyone into a single movement is of course interesting (if we view it that way). One of the simplest ways is to say that 'everything gets taken into account' from a timeless level perspective, but that's a little out of scope here.

POST: Getting used to defining your own dream, letting go of objective meaning and embracing subjective meaning.

My snap response would be,: Why would something be meaningless, just because it turns out not to be made from atoms? Meaning was always (I suggest) about the relationship between one part of experience with another. That doesn't change. But...

I suppose it can be disconcerting if you find that the fight isn't a real fight - that the odds weren't stacked against you and your triumph is over yourself. But wasn't that always true anyway? And doesn't the bummer of death in the materialist view make things more meaningless?

Although I suppose realising that people, including yourself, are just sensory imagery with nothing them, might take a bit of getting used to...

POST: Dreaming Versus Being Awake

Have you ever had a lucid dream (a dream in which you realise you are dreaming)? Then you are not even a zombie; you are fully aware and can manage the dream accordingly. I'd say that waking and dreaming realities are on the same level. They are not in fact "realities", just parallel sensory experiences. Right now, you are in a room, reading this. Now, think about the room next door...

This room remains vivid but "with" it is now a shadow image of the next room. The only difference between the two is in terms of intensity and stability. If you could make the next-room sensory pattern more intense than the this-room sensory pattern, you would be in the next room...

It's remarkably hard to hold onto as a direct insight, rather than just as a concept - because any attempt to do so, loses it.[1] This is why I've been advocating that "letting go of control of attention" is the vital ingredient. We usually focus on letting go of our thoughts and our bodies, and yet still unwittingly "deform" our experiential space by manipulating "attention". In fact, you shouldn't interfere with your attention at all, as conceived of as a narrowing down to certain objects in space. Rather, you want to use activation of desired images - in other words, intend to make a pattern dominant.

I've been injecting the related ideas elsewhere to see how they take with other people coming from a different place, without the "baggage" of previous metaphysical thought. (So, ahem, please resist the urge to "contaminate" them, so to speak.)

[1] This makes senses of course; you can't hold onto "open attention" by narrowing your attention!

Open attention is just a delusion. All attention is closed in some way. You choose which way you want to close it. "Open" is just another kind of "closed."

Pffft. The essence is: "attention" is completely the wrong way to look at it. There's no such thing as attention, as in a "positive" thing, except as a concept. It's a concept which leads to a poor intention. Indeed, there is no such thing as "open attention" (apart from a concept) because it corresponds to an absence of something. The absence of deforming experience rather than triggering it.

For as long as you try to use attention to interrogate the experience of simultaneity of thought (of the room now, of the next room, of your shopping list) you disturb it.

In my view there is nothing to disturb. All is false, not just some! Therefore, we play as we want to.

Yeah, but that's just tedious and useless, like saying "all is consciousness". The fact is, when people try and use this stuff - to "play as they want to", as you put it - they unwittingly use things like concentration and attention to do so, which actually works against their efforts. Most people don't get how to imagine, that it's "taking on the shape of" thoughts, and "attention" is one of the sneakiest ideas going around. People genuinely don't realise that attention is effectively a locking down of what you are focusing on. They try to relax by using their attention; they try to dissolve and forget things by using their attention. All in the aid of "playing as they want to".

This suggests experience has a correct form that we're fucking up somehow.

It doesn't have a correct form, but each of us might have a desired from. And "attention" is something that can block our transition to the desired state, even as we try to use it to get there.

This isn't a bad thing when it happens, and it's not always locking down. There are different kinds of attention. There is acidic attention, which melts whatever it turns to. There is approving attention, which fortifies whatever it turns to.

Narrowed attention always locks down. The "other kinds" of attention are actually intention. There's a subtle difference between "bringing to the fore" in awareness such that it dominates the moment, with the intention to accomplish something (melting!), and attempting to contract space down to the target. "Attentional focus" (concentration) is not necessarily the same as "attending to something" (having that be the dominant image or pattern). Although very quickly here we're going to have trouble with language,

because people's idea of what "concentration" is does vary. Those who "focus" by contracting space to the object, vs those who "focus" by allowing it to fill the space.

For most people agency is part of that desired form. We don't want to be (or feel like) passive TV watchers, guests to our own experiencing.

Agency or "the experience of agency". Because the experience of agency isn't agency; it's just another experience. It's second cause and it's a fake, like when people generate muscle tension prior to moving their body, because "that's them 'doing' the movement".

Consider too that you might deliberately want to make use of this "locking down" feature of attention. So even assuming attention had such a mechanical quality (I don't agree), it would still be useful! Once you achieve a desired state, you'd want to lock it down for some time. So even from your perspective narrowed attention wouldn't be a universally bad kind of attention.

Attention isn't the way to do this - simply declaring state-stability is the way to do this. Maintaining narrow attention is to fight against all change, you start getting pretty tense as your whole experience starts trying to cram itself into the compressed space you've created. Which is not to say it has no use - it's even useful just for a raw experience of "playing with the shape of your space" - but I don't think it's a great way to do those things. Experimenting is the only way to tell though.

To try to avoid a natural movement of attention is unnatural and wrong. Sometimes you want to narrow your attention. Why block it?

This is exactly my point - let it run free! But then you contradict yourself. You shouldn't be narrowing or expanding it yourself, you should instead by intending and there rest of it "just happens".

You've saddled attention with some very unhelpful features by declaring them to be so. And now it is so for you. Sad.

Heheh. Well, I think I've distinguished between the variations: attending as object taking dominance ("summoning an experience into awareness"),and attention as contracting and narrowing space (due to a misunderstanding arising from words such as "concentrate" and "focus").

The difference we're having is...

You don't narrow your attention at all by "doing" it. The apparent focusing of attention is a side-effect when we allow a particular object to dominate our experience. The problem arises when we try to make this happen by inferring a means ("focusing") and using those means to get the result. We feel we have to "do something" to get the result, and so mangle it up and create opposition. Just as we get confused and think that we have to "do" the process of standing up - becomes aware of our sitting position, move muscles into position, etc - when in fact we should simply bring the desired result to mind. There is no process to this, and the attempt to experience a process introduces strain.

Obviously, if that's what people want they can do that - but in the main people are under the misapprehension they need to create the transition, but that is not the case, and attempting to do so actually opposes the transition.

When you just want a result...

Rituals are fine, it's only when the details of those rituals are in opposition to the desired result. Rituals can often let you do something that you maybe can't persuade yourself otherwise. This isn't against "stepping stones" themselves, it's about having opposing intentions - intending one state while at the same time intending another. But if you are going to climb the building floor by floor, I reckon you should intend each floor at a time - allow that to be your complete experience. But life's about more than that...

I definitely agree with rituals and steps as a way to learn. After all, if you always go only for the end result, you might miss other pathways and opportunities!

And, y'know, life's about experiences not just getting everything over with. I totally agree on aesthetics. The ways and the flourishes are part of the fun. Even if we could just teleport everywhere, we might still choose to take a walk in the woods, or enter a running competition, or do some rock climbing. Y'know, cos doing stuff does feel good. The point I've probably been making is: If you want a particular experience, then summon that. There are no intermediates required though, so it's a choice. And - like you said earlier - freedom is all about choice, and part of that is knowing what you don't have to do.

So imo you should be very careful about what you say about attention.

This, actually, is the crux of the matter. What we tend to want from attention is to bring something into mind; how we often do it is by compressing the space down to that something - which turns out to be extra.

If you try to jump from A to D, but your mind is not emotionally and intellectually ready for that, your subconscious will block this attempt.

Good point. Acceptable stepping stones!

Actually, magick's been all about this, right? Because it's hard to conceive of ourselves as the direct cause of all things, we nominate something else - an object, or even a word - as the cause, and invoke that. We create and assign power to a "technology" to do what we want.

Everything is good. All meat is good meat.

It's all just experiencing! Even "bad" experiences will be, from a certain perspective, just fine. Returning a little to what we were talking about before about attention, with reference to the Imagination Room metaphor, I'd say that if we...

- Assume that what is desired is for a particular pattern to be dominant.
- If we are beholden to a "spatially-extended world" view, we will be inclined to try to somehow filter out the rest of the world in an effort to isolate that pattern. Since that view implies the world itself is kinda fixed, our only option is to compress our perception so that it includes only that pattern. This is like creating "walls" in the Imagination Room and then moving them to surround a particular pattern. (This is the misunderstanding and the uncomfortable result I'm trying to describe.)
- If instead we have the "unbounded imagination room" view, then we realise there is no spatially-extended world, there is just the current activated patterns. This leads us to instead trigger the desired experience into the room, rather than assume an experience and try to then filter it down.

The first method involves trying to narrow down an experience (narrow, bounded attention), the second involves no narrowing or bounding, we remain open and have the pattern arise within that openness?

EDIT: On consequences, that's something we should explore. We can't be aware of all consequences in advance (I suggest) and maybe not even aware of what will be necessary for us to experience to get from here to there, so every act has to be one of abandonment?

It's like when you look at a mountain range and you feel how mighty and stable nature is, then you think how fickle and weak you are by comparison.

So why is the loan difficult to recall? Given that our power can never go away, and can never change in nature, the difficulty must arise from confusion. Two possible contributors. These things combined mean we don't realise our everyday power and so we don't even try:

- The first is: time. It apparently takes time to change the world in ways that are not fully habitualised. It is "easy" to move your legs or move a pencil; it is "hard" to teleport or change the location of a mountain. Because we cannot do something in a short time-frame we tend to think it as not being possible. In fact, we do get results constantly by this method: synchronicity. These seem like weird random coincidences though, because of the second point.
- The second is: being unaware of the mechanism. That simply holding a pattern in mind for a while will result in the same pattern appearing in the "external" world. And doing so with intention (which is really just a more specific thought, the addition of definition change) even more so.

There's also our conception of the world as filled with heavy objects. A "mountain" is a massive solid mass of earth and rock so how it could possibly be moved by decision alone? But in fact, a "mountain" is more like a couple of dimensionless facts (a shape, a location) and a floating semi-transparent picture. To move a mountain you might have to "hold in mind" its change of location for some time, the first time, so ingrained is the habit of "mountains can't move". Although: the more you have accepted the notion of a transparent, depthless world the easier it should be.

In the second case [the Imagination Room] the world is completely internalized.

Saying "interalized" isn't quite right though, because there is no internal to that model. The room itself has no boundary; it is unbounded consciousness. All possible worlds are "in" it but the room itself (consciousness which is the-real-you) isn't anywhere. It can take on the shape of apparently being you-and-a-separate-world or everything-is-in-mind, but those are both just different experiential views (which one can freely flip between).

EDIT: Additional. If you were completely detached, then simply triggering a thought would overlay-combine that pattern into experience. Even saying a phrase would trigger the associated pattern into experience. This happens with synchronicity quite a bit anyway; but commanding a mountain to move and it moving! The question is: does it just move for you? We need to talk about the "world-sharing model" here.

[On magick and related]

All good points. Even if you know the deal, it's not necessarily easy to allow such a transition. Just look at people's reactions to "glitch-like" experiences. Sometimes people get excited. More often they are frightened. But why be frightened just because a car suddenly vanished, or a person changed appearance? Because it means anything at all could happen. Even being healed from an illness is problematic. If you (say) allowed your life-threatening infection to just vanish overnight, what would be the larger implications of that?

Reality would be broken (in terms of your previous notions of it).

You can make sudden transitions without having to go through a developmental process - after all, all that you're doing is learning to feel safe and let go - but it's effectively world-suicide so it's reasonable to not want to do it. You're not human anyway but you are having a human-in-a-world experience. That ends when you start altering literal landscapes. Or you memory-wipe. Or you account for it by saying it wasn't you that did it.

[The imagination room and internal/external]

I'm still not sure what you are referring to with "internal" there?

In that view, the only thing I can see that could be labeled as internal is those patterns which are not currently "bright and dominant". The whole world-so-far is literally being experienced here, now (felt-sense) so there is no outside, or inside. There's just potentially categorisation. Although what I think you're getting at later - that there is no seeking for confirmation because you have direct access to "what is" anyway; it would be like asking for confirmation of your own thought - I of course agree with.

So if we were to grow disgusted and overly unsettled by the human body, that would hurt our state of mind. So these contemplative tools, contemplating the downsides, are powerful and dangerous and effective for all the same reasons.

And our contemplations, since they lead to a transformation of worldview, are reflected in our experience, including that of the body - which, after all, is made from ideas. Interesting on the eyesight. I think I've shared this story before, but when 3D televisions first became available, lots of people reported interesting experiences. One guy had a girlfriend whose eyesight was terrible. When she was watching the 3D TV with him she became absolutely traumatised - because it presented the world to her in total clarity. She was confronted with it being there in miniature form, the distance inserted directly into her vision. She didn't want to see; she was accidentally-deliberately blurring the world out.

It's that which is within the POV. POV is a specific and partial manner of knowing, experiencing and intending.

Okay, so we're talking about the "everyday person" here rather than someone who has come to understand the revised view - in which although habitual imagery might be "as if" there is a perspective, you are actually the entirety. In other words, the "individuality" is just a thought that is activated presently; you are never actually an individual, just as the TV screen isn't a particular TV channel.

All manners of experiencing have alternatives. No matter how enlightened you become and no matter how you revise your notions of body, personality, etc... it's all optional and you don't have to live like that.

I agree with this but...

So you remain, always, an individual.

I don't with this. In what sense are you an individual, except that you are not experiencing all possible thoughts at equal intensity at the same time? You may call your experience being-an-individual but the experience itself just consists of selected patterns. Implicit here is that you are having an experience whilst in another location there is another experience - but that's surely not the case. Space and time are aspects of an experience; they are not available for there to be a "between experiences" or "separate experiences" beyond this. You and I, for instance, are not experiencing each other at the same time - but equally, neither are we not. It's a case of "the context cannot support that idea".

In the sense that in distinguish yourself by your unique choices. You distance yourself from other options, and thus individuate.

Okay, although that is quite broad. That basically saying: I am "these thoughts" right now rather than "those thoughts". In fact, it's really saying "at the moment, these thoughts are brighter than these other thoughts; I identify myself with the brighter thoughts". There is no distance. And the thoughts correspond to a world rather than to a person.

Conventional reality is an unconscious magickal assertion too, and it's groundless.

For sure, there is no fundamental ground [that is solid]. Like Narada and his Maya experience, it is all dissolved at any moment and revealed to just be sensory fluctuations and not even that. We live in a world - or rather, as a world - of "as if". But what use is freedom, if one is afraid to use it? Is it just the comfort blanket to make us feel better about our lack of courage? Could and should; I could do it any time I wanted, but won't.

It's even more subtle than that, because you don't have to identify with your thoughts.

You should identify with all of your thoughts - but not any one thought, and not their content.

You can have intellectual or emotional distance from something, for example.

But what, exactly, does this mean? It might not be an object which is located in this room, say, but it is a conceptual object that you have located in conceptual space. I suggest that emotional distance is a literal distance in imagination space, in the "parallel space" associated with that metaphor.

However when you attempt something you haven't done in you recent or any memory, you may feel doubts, and fear.

What is this a fear... of? Is all fear the the fear of annihilation, the fear of a transformation of the thought-pattern-concept that we have become identified with?

You can conceive of it that way, if you like. But is that what it really is? Or just a conception you find useful?

There are many ways to conceive of something, but (I suggest) there is no "really is" behind it. There are just different representations pointing at each other. Like George Berkeley's "objects as bundles or collections of ideas" - the "vase" is the superposition of all vase experiences and thoughts, and so on, and there is no "real vase" other than this. "Reality" literally is a collection of interconnected metaphors "about" a fictional thing we call "reality"; the metaphors simply point to one another. A castle in the sky!

Language is part of this too. If you talk in terms of "distance" then you are invoking a spatial metaphor; at the very least you have a "feel" of space between your designated location and an idea representing (and being part of) the emotion.

I don't think so. I think half of the fear is the fear of annihilation, and the other half is the fear of suffering.

Yes. Suffering - isn't that a fear of a change of the world, whereas the other side is a change of oneself? Same thing fundamentally, so the fear comes from the apparent division in both cases?

I think you're describing some portion of suffering. But not all suffering is fear of change per se. For example, our thoughts change moment by moment, but hardly anyone is afraid of their thoughts or mind. People are accustomed to this. In fact, if a thought stuck around and refused to change, that would probably elicit fear.

That's a matter of convention though. If one truly understood that both "the world" and "me" were merely particularly bright thoughts that hung around more than the others, would fear dissipate? Certain traditions would have us believe so, certainly.

Maybe? I think it would depend on what you really wanted to be true. If your understanding runs counter what you desire to be true, it will distress you.

I guess I'm implying that true understanding = acceptance in this case. Otherwise you'd be fighting against the void.

Maybe when understanding is extremely thorough, there is room for little else in the mind, which would be like acceptance.

Right. Acceptance = forgetting, in a sense. It's allowing one thought (experiential pattern) to fully brighten at the expense of all others. Although this is a special "meta" case: it's accepting all thoughts.

Attention cannot be "narrowed" because it suggests it should be wider than it is now.

That absence of narrow attention is... no attention. But singe language dictates I need an opposite for "narrow attention" I called it "open" - note, I didn't call it "wide". Remember, I'm not saying there's anything wrong with having one object or detail fill your perception (attending-to, perhaps?), I'm saying that doing so by contracting your space or "concentrating" is problematic. This is not actually easy to talk about; experimentation is the way. Most people I've encouraged to "stop narrowing" seems to like the result; it's like any attending and redirecting is effortless because you are no longer trying to experience the "doing" of it.

Sure, and if you weren't paying attention, how would you know this? :) Eh? Eh? Eeeehhh???

Haha, cheeky fucker! :-) But my paragraph above should help clarify.

[Experience of agency isn't agency] There is no difference between experiential and actual in our view. :)

But in this particular case, there's a point. I could phrase it better by saying: the experiencing of apparently-causing is not itself causal, because it is a resultant. The "feeling of doing" is always a result, a generated experience.

But you'll notice that even when people do this fake, something about this fake is not fake, since they still do move around! So there is truth in the fake. And fake in the true.

No. The "doing" is actually in opposition to the movement. It's like trying to stay still and walk at the same time. As soon as you stop trying to "do" in this way, everything becomes easy. It's tricky initially, because even the "thought of being in a position" triggers that pattern. So if you are sat down and want to stand up, you must avoid "thinking of being sat" or even "thinking of the process of standing" - you must leave all that alone and simply "think of being stood up".

Because any experience whatsoever, even the experience of not having any experience, is a fact of attention.

The point here is that one selects or brings-into-awareness by a "choice" rather than by manipulating the space in which experiences arise - which is a common error that people make (I have found). It's not really a philosophical point. It's a common practical habit borne of misunderstanding.

If you think "contracting space" is problematic, please explain what the problem is, exactly.

It is problematic if you are generating unpleasant results in addition to your desire. It's the equivalent of straining to read the letters on the screen by "concentrating hard", which doesn't help and in fact even works against you.

[the experiencing of apparently-causing is not itself causal, because it is a resultant.] I don't know if this is always true.

It's a matter of recognition. Incorrectly assuming that you need to "do this" in order to "experience that" puts you at a disadvantage. Of course, it also gets used in magical work: declaring that "this" has the property of "making this happen" and then using it accordingly. But being aware of that is important, to know that you are "dreaming" it into utility.

I think you're going overboard. You can't trick yourself like that.

It's not a trick; it's how this works fundamentally. As in the room example, "you can't be in two places at once" (let's put aside talk of actual bilocation). If you bring two opposite states to mind at once, you lock your experience. If you want to stand up efficiently, you must release the thought of sitting down and indeed any other position. By triggering the "being stood up" thought, your experience naturally flows to that. This applies to more than just getting up out of a chair (which, after all, is an imaginary experience like any other)...

Right, but why should these two features bump into each other? You can do both at once!

They shouldn't but our use of language has, I've noticed, let to many people doing something they don't knowingly intend to do. This wouldn't matter so much, except that narrowed attention (reduction of experiential space, although not of awareness itself of course) leads to physical tension, lack of ease and fluidity in thought and creation, and a build-up of "stuck thoughts and incomplete movements" (as written elsewhere).

You're saying "not until you stop focusing your attention will you experience magick." You're saying I have to be inflexible toward how I use my attention.

I definitely never said that (the first sentence). And the other is sort of the opposite of what I'm saying, which is: that narrowing of attention, fixing attention, leads to an inflexibility in experience, because it "locks" the patterns you are presently focused on. Again, like the "triggering being-sat-down" and then trying to "trigger being-stood-up". Magick requires detachment, and this is at the heart of it: allowing patterns to dissolve back into the background (so to speak). Narrowed attention inhibits this.

That's true, but the way to unfuck them is to alert them, which includes alerting their attention to some heretofore ignored facts.

That's exactly what I'm doing. There's no point in messing about though; we might as well say: if you are doing this then this is what's happening. Naturally, people must should against their own experience, and they don't need me to tell them to do so. Otherwise I'd be far more introductory and explanatory, right? (And I know you don't need cushioning!)

EDIT: Although yeah I'm totally aware I'm bashing this stuff out quite "prescriptively" today. :-P

So, I'm describing the essence of it okay though? In all sorts of situations we end up creating an experience which is just extra clutter on the way to what we want, and even opposes it. If "magick" works by bringing a thought into awareness and having it become the brightest thought (if you see what I mean), then introducing intermediate states actually just gets in the way of your desired result.

It's like you can fly to the top floor just by "wishing" it, but instead you end up interfering with that by "wishing" each of the floors between here and there. Which is great if you want the tour, but often we (by which I mean: me, often) don't realise that we can "skip to the end" - provided we don't think about those intermediary steps and thereby bring them into awareness.

Agreed on this. My other response is basically that. The only thing I'd add is that, yes, slowness might be desirable, savouring the experience - but I'm suggesting is that many people (myself in the past, and still now) unwittingly create conflict and opposition in their approach.

You know that I'm just asserting a conclusion so that you can bounce back on it though, yes?

It works with you, because you immediately pick a hole in things and we deconstruct the process, and take it apart in a way that's probably totally different to how it was put together - or rather, how I think it was put together, which often turns out to involve assumptions which I hadn't have spotted, because that's how good discussion plays out.

What manner of trickery is this? :) Please carry on.

I think it might be a compliment! ;-) And just checking we're on the same page too.

To me attention is similar to a cursor on a computer screen. Intention is similar to programming. So intention is what creates content. And attention is then what is moment-to-moment emphasized in that content. They are both functioning together at once. One doesn't replace or obviate another.

So the end result is always: you've selected an experience. An alternative definition to try out: "attention" is bringing into awareness something that has already been experienced in the main senses ("already 'exists'"), "intention" is bringing into awareness something that has only been experienced in the shadow-senses ("only thought of").

Intention changes your felt-sense. Attention navigates around felt-sense.

Elegant. Can I add: "intending is the changing of your felt-sense"

Sure. Why would you even ask for a permission? Of course you wouldn't, because you're a Lord and a mage. Therefore you must be joking now.

It was a rhetorical question. And my answer was, unsurprisingly: "yes you can, and why don't you have some other cool things too".

...

Hmm, interesting thoughts! More random poking...

What I think I was poking at, is the possibility that the subjective experience is merely some epi-phenomenum of some deeper non-conscious process.

But there is never anything other than subjective experience?

We might imagine some deeper process beyond consciousness, but we do that imagining in consciousness. That amounts to making "explanatory fictions" or stories, since we'll never actually experience supporting evidence (I suggest!).

You can test this by simply closing the eyes, or putting fingers in the ears.

Voids are a subjective experience also. But why would we expect closing our eyes to stop persistence? It is not a true void. A true void is absolute complete forgetting. What makes a world seem solid? That the images are vivid with well-defined lines and (key to most) that there is a sense of solid touch. But it actually doesn't matter how focused or fuzzy something is in terms of it being a subjective experience; it's just a subjective experience... of fuzziness. A sharp dream (a dream of sharpness!) is just as much a dream as a fuzzy dream (a dream of fuzziness!).

If my subjective experience is everything, then that would have to include those voids - as the world seems to 'pop back' from them.

But you are still experiencing the world subtly!

It is tempting to say that our experience is sights-sounds-texture, but actually there is a whole complex felt-sense in the background. It is this which persists when we close our eyes and throughout our apparent movements in the world. The "current state of the world" is dissolved into this felt-sense. We are always actually experiencing everything. If it were to be dropped, then the world would completely restart - but you would never know it. And when, in this newly-born world, you went looking for memories, you would find them (on demand). Probably the key to all this is to be clear about what "you" are. If you believe you are a "thing" looking out at a world, then all sorts of problems kick in. If you instead you observe that you are a "conscious open sensory space" in which experiences arise, one of which is being-a-person-in-a-world, then it's easier to see that all experience is subjective, no matter that its qualities.

Short version: A lack of imagery or a lack of sound is not a lack of subjective experience; it is a subjective experience that happens to lack imagery and sound. Even the experience of "open empty space" is itself a subjective experience.

There is the direct experience part: the sights-sounds-texture you mention (I'd like to say sights-sounds-smell-touch - SSST!). Then there is the sensation of Time - an ever circulating loop of about two or three seconds (SSSTT).

I like the "SSSTT" thing! Hmm, so following on from that:

I see "time" as just the fading brightness of the most intense aspect of the ongoing sensory experience. That is, the "ongoing duration". 'The past' is then whatever residual patterns we've hooked onto the conceptual pattern we've got, a timeline say (basically just a retrieval concept we never quite release). I see the felt-sense as the entirety of the world to date (in the largest sense). It's all dissolved in there and it never goes away. Because if it did, the world would restart. There's a little thought experiment I played with a while back which is quite good for this. Turn off all your senses, what's left? You can get pretty much down to unlocated openness, although you still retain a sense of identity behind just consciousness. A feeling. If you switch off all the senses, the only sense left is the felt-sense.

The conclusion: You are always experiencing the entire world, right now, in every moment. Literally, sensorily experiencing it. And if you dropped parts, effectively forgot them completely, they would be gone forever.

My ordering: Open consciousness; sensory patterns within consciousness, evolving in intensity; some labelled "body" and "mind/thought" and "me", others labelled "world". All experience is subjective, to nobody.

The total sum of all your observations (intense-sensory and shadow-sensory), the accumulation of facts which are active, the current state of the pattern you call "the world". Your world right now is the culmination of all the experiences which have arisen in your consciousness space. The superposition of all patterns. For the purposes of this, we might consider each instant of sensory experiencing to be "a fact". All facts will make sense in terms of previous facts (unless there is a deliberate intervention) because the pattern is one whole. The felt-sense, then, is the constant experiencing of that entirety in your consciousness.

EDIT: Imagine that in addition to the SSSTT of this room, you also had a sense of the whole space and its contents all-at-once, like a unique dimensionless number you can "feel" that corresponds to this arrangement and has everything within it. Now have this include things that are out of sight. That, but for the whole world. SSSTTG, where "G" stands for "global".

To be clear, it's better to say that awareness "takes on the shape of" experience. So what's changed isn't awareness itself, but its content, its shape.

- Subjective experience is "made from" awareness; awareness is like a non-material material whose only property is being-aware and which takes on the shape of experience.

So the background feeling, all the accumulated experiences or patterns, like the sharks and the suncream and all the other facts and memories, that's the felt-sense. It's the "texture" of "you" in a way: it's the entirety of you-to-date, dissolved-enfolded. The rush of old feelings is a memory-experience, unfolded. The room around you now is a sensation-experience, unfolded. If neither was present, if nothing was unfolded, there would just be that "texture" to the awareness-that-you-are. (If that texture faded, it would just be void.) In the sun-stars-sky analogy: awareness is the daytime sky, the stars are the entirety of what has been experienced (felt-sense or G), the sun is the

current experience (SSSTT). Actually the second T is the name for the fade-transition between different stars bring bright => sun. Experiment: When you "feel out" information within yourself you can see how it works. If you loosely placed your attention centrally in the body and assert something - e.g. "I feel great" - and allow the response to arise, you can see how a state unfolding feels, if you sit with it and let the resulting state information arise (responding with why you don't, probably).

If it's only property is being-aware how can it also have the property of taking on a shape? That's two properties. Nobody expects the Spanish Inquisition...

Heh. Taking on a shape isn't a property, it's a capacity. Since it's not actually a material in the mechanical sense it has no properties at all (apart from being-aware). Even when it takes on the shape of something, it only apparently does so - in the same sense as a TV screen "takes on the shape of" people doing stuff in a world. It never really becomes people-stuff-world but it takes on a shape such that people-stuff-world are experienced.

The answer is: all three.

I'm struggling to put into words that there's something up with your description of awareness.

And this is where the problem lies, as you later observe: language. In order to think about something, you have to split it into parts (concepts) and then arrange them relative to one another in mental space (a conceptual framework). You are doomed to create divisions in order to understand something intellectually! So awareness is:

- The non-material material whose only property is being-aware, which takes on the shape of experience, and experiences itself relative to itself.

Which very quickly starts to sound like nonsense. We're having to create artificial divisions ("non-material material") in order to put it into language, when of course the next step is to collapse those divisions such that nothing can be said (" ").

In other other words to be aware requires structure of some sort. Another way of putting it is that awareness needs a certain amount of surprise or difference or information. Without that, there is no awareness.

No, there is always awareness - there is always "being". If awareness has no folds in it, there is not experience but there is still awareness.

Awareness is not an actor!

No, because acting implies something which acts and something which is acted upon. Awareness, instead, becomes. When "it is raining" what is the "it"? It's an error of language! It would be more accurate to say "the world becomes raining".

I knew my sloppy language would come back to bite me! :-)

The awareness of 'being' as something that carries on without experience is at best an illusion. . . .

It's not awareness of being. Hmm. Okay let's see if we can arrange this better. Let's begin with:

- There is "what-is", which I have been calling awareness. Other traditions call it "pure awareness". It isn't awareness of anything. It has no inherent division, spatially or temporally; it's that which such things are formed of. In a sense it is all that exists and it does not exist (because: relative to what?). We could think of it like a blanket of material that is aware of any folds within it. Lying flat there is no experience of folds - there is simply "existing", which leaves no trace. We can't say "experience of" existing, so we might say simply "being". Regardless, it is "that such that" if a shape is adopted then the self-experiencing of that shape is the case. Maybe this is what you are meaning by "void"?
- When this takes on a shape, then that shape experiences itself - it is the experiencing of itself. No matter what happens, it has no actual "parts" or divisions, however it can apparently have parts, as folds are experienced relative to one another. The experience of division and location and change.

The awareness of being, is simply just another part of the crowd of awarenesses.

I'd probably phrase it as: there is no awareness of being but there can be awareness of being something. Now, we get onto the experience of the world itself, which is a matter of that background global felt-sense and the bright sensory aspects and thoughts. If your bright sensory experiences (which "comes together with" space and time) fades away, then you are left with a non-spatial, non-temporal experience of being-a-world or being-a-state. If that fades away completely then there is no world or universe.

Awareness as a thing is simply comprised of many parts.

Or a superposition of patterns? I would shy aware from saying "parts" for the earlier reasons, because awareness isn't "comprised of" anything if it's what those things are formed from. Patterns don't necessarily need division and their superposition just leads to a more complex form, rather than a proliferation of parts. So we retain the experiencing without saying awareness is "comprised of" parts that sum to the experience.

POST: My experience of "Just Decide"

I'm actually just imagining that I'm not using efforts to do things.

How will you be able to tell whether you are "actually" not using effort or you are "just imagining" not using effort, if the experience is identical? :-)

Good post though. Something to ponder: What if one time you allowed your body to rise up and then... never interfered with it ever again? Just allowed it to respond spontaneously with/as the enviromment as it unfolds?

For instance, the "catching exercise" is fun - having decided you are going to catch things, you let your body go and have a friend throw stuff at you, and find you catch it in efficient and unexpected ways. But what if that was always how it was? Your body automatically responding like that without the Decison-Prep? Someone throws something, your body just effortlessly catches it. A guy on a bike skids in front of you unexpectedly, your body sidesteps to avoid collision spontaneously.

That's the eventual outcome: **One Decision To Rule Them All!**

As you have anticipated, the realisation is that the "the only thing I'm trying to do is hold back these impulses", and that the final decision is to simply allow what is always trying to happen anyway. To get out of the way. That's something to aspire to eventually.

EDIT: This actually has the greatest potential benefit for speed and accuracy tasks, but the extent to which you need to be "the observer" is greatly increased. Think the knife trick in Aliens or more likely: playing sport or threading a needle. Video games are great for practice.

The more I let go the more fear I feel, and the more fear I feel the more faith I need to give myself.

Yes indeed, identifying with the awareness-space is the way forward. And it is an interesting thing, this matter of "faith". In some ways, it end up being that the faith is to not stop and so therefore you avoid having to restart again. Both the "letting happen" and the sense of expanded space can bring with them a sense of vulnerability and exposure, but once committed to it's actually very secure and freeing.

For me, the experience might eventually go away. At least, that's been my experience with many mental "hacks" so far.

Only if you re-trigger the previous experience by thinking about it or returning to it as your starting point. There can be a temptation sometimes to start from the beginning. You discover a way to do something, but you keep bringing to mind the old way in order to recall the new way. This reasserts the old position!

For example, when we stand up from a chair we can do so by summoning the sensory-image of ourselves standing, and just allowing the body to rise. However, if we do so by imaging our initial sitting position first and then the standing position, we effectively reset ourselves. We are intending both positions at once. Anyway, something to watch out for. This is what "releasing" into the desired state is all about. You have to resist the urge to check you are not in the old state, how far you have progressed from the old state, or even that there is an old state.

Feeling writerly this morning after my coffee. So, a little thought experiment (almost literally), based on a metaphor I've used elsewhere:

The Imagination Room Revisited

Something you might find useful as a rule of thumb, is to think of your experience as literally a responsive dream-space: the world around you is just a habitual thought. The room you are in is a strong habit - a imaginary scene that has condensed such that the thought-of-being-in-this-location triggers this thought-room. The bodily experience you have is similarly an accumulation of thoughts or "imaginings". Imagine for a moment that if you sat in a chair and imagined-that there was a vase on the table in front of you, unwaveringly, it would eventually solidify into persistence in front of you. If you didn't go the full distance, what instead would happen is that a vase would appear in your life that would seem to come via events in the world.

However, since there is no persistent spatially-extended world outside your current experience, that is only an apparently true. All that there ever is, is this "imagination space" the contents of which are shifting and changing "as if" you are a body in a world. You never go anywhere, you are never located anywhere.

Adopting this view, what does it mean to stand up?

It means to change the "shape" of the imagination space from "the experience of sitting down" to "the experience of standing up". And since you are the imagination space, what you are doing is shape-shifting yourself. The change is made by shifting this 3D-sensory-thought to that 3D-sensory-thought. So you can see why you shouldn't "look back" and think about where you were - because that means you are shifting back into the previous state, using the exact mechanism of change! And any habitual is more easily "triggered" by partial thinking in this way, so you are most vulnerable to that when trying to shift away from the habitual.

Let the movement of your imagination destroy the place from which you came, and don't be like Lot's wife!

By the time Lot reached Zoar, the sun had risen over the land. Then the Lord rained down burning sulfur on Sodom and Gomorrah—from the Lord out of the heavens. Thus he overthrew those cities and the entire plain, destroying all those living in the cities—and also the vegetation in the land. But Lot’s wife looked back, and she became a pillar of salt.
-- Genesis 19 - EDIT: "To regard, to consider, to pay attention to"

(Yeah I am not remotely religious, but some of the parables are obviously tales with reference to this stuff. The rest of that chapter has a few interesting things to say about creation too. If you read them literally, it's a sorry tale of incest! But actually it's probably describing something like creation-from-self-imagination.)

A Personal Addressable Voxel-Space

Another way to envisage this is a voxel space. Basically, imagine a complete and total void with not even space. Now, imagine a 3-dimensional array of cubes going on forever. Each cube can contain a sensory "pixel" (visual, auditory, texture, feeling). The room you are in now is basically a particular sensory pattern existing in that array. If you think a thought, that appears in the same voxel-space, only less intense and less stable. However, it leaves a trace upon the space, a slight deformation, however subtle - which results in a momentum from the current state towards the state described or defined by the thought. If you are completely detached (is in, not "persisting" other patterns) then the transition between states is effortless and clean. Otherwise, what occurs is a mangling between the present state and the thought, and any other thoughts you are holding onto or resisting. So when you "look back" you are literally re-defining the target of the voxel-space to your previous state again. That's why lots of "manifestation" type techniques recommend "letting go of your desire". Not because you need to forget what you are after, but because our tendency is to re-created the "state of desiring" when we think about it.

All good. So one interpretation of the "pillar of salt" fits in quite nicely. Earlier in the story:

Another Jewish legend says that because Lot's wife sinned with salt, she was punished with salt. On the night the two angels visited Lot, he requested of his wife to prepare a feast for them. Not having any salt, Lot's wife asked of her neighbors for salt which so happened to alert them of the presence of their guests, resulting in the mob action that endangered Lot's family.
-- Jewish commentaries on Lot's wife, Wikipedia

So, as with other parables such as The Parable of the Unjust Steward, this is about forgiveness. And forgiveness in the deeper sense of the word: to forget completely. Lot's wife had made an error relating to salt. By looking back she remained bound to that, she became once again her error - in the same way as when you look back at a habit, you are returned to that state.

Yes, it fits nicely. Also, here's a related essay which is worth a look:

For it is magic, this pruning shears of revision. It really is not only the achievement of objectives, but if you do it daily, it will awaken in you the spirit of Jesus, which is continual forgiveness of sin. In this teaching the sinner should always go free; you will never condemn him, for when the spirit is awake in you you will realize in him there is no condemnation, only forgiveness, and forgiveness is not as man of the world thinks when he omits the actual execution of his revenge.
-- The Pruning Shears of Revision, Neville Goddard

(Assuming you haven't already encountered him.) Goddard was a New Thought guy who interpreted the parables of the Bible as offering insight and instruction on how reality actually worked. His language is a bit old-style, but his concept of the "pruning shears" corresponds to recalling and "editing" the past so that it no longer participates in the ongoing moment - i.e. total forgiveness.

It's worth checking out his book The Law and the Promise and other materials. Lots of stuff here and a summary article here. You'll see how the "technique" of it corresponds well to the subjective idealist's concept of a "private view" of the world which is mutable.

POST: A physicalism-breaking experience while high last night

You can certainly bend the visual field with practice; senses and thoughts occur in the same space and the of the same thing. It doesn't necessarily negate physicality in and of itself - after all, the "standard interpretation" of materialism is indeed that the senses produce electrical signals in the brain and that's where "your world" is. In a way, this can be used as proof that perception isn't direct and is in fact brain-based!

Making that explicit does give you the first step on the way to unravelling things philosophically, though. The first chapter of The Doctrine of the Subtle Worlds is quite a good read on that. It's definitely true that having direct experiences like this (which point out that you are not actually experiencing a solid 3D world even if you are in one) is far more groundbreaking that just thinking a lot about it. I'll clarify: Direct experiences of the flexibility of their perceptions rather than simply thinking about how they should-or-could be flexible. I'm more referring to bending the visual field in front of us, rather than just OP's behind-the-eyes effects.

Yeah, I think that anything can jog you out of assumption if you are being attentive, because it's attentiveness itself which does the jogging. What really changes your view is a new context: once you've noticed that everything is of-a-piece with an undivided background, the taste of transparency does it. But if you're not even attending...

I don't think playing with visuals behind the eyes is going to be of a lot of use to normal, sober, ordinary people...

Or, if it's done while already knowing what you are looking for and experimenting with. In which case you are not discovering anything, you're already a convert and are exploring it. Personally, I think even a flash of accidentally dropping your hold on attention - brief exposure to unboundedness - can achieve more insight than years of messing around with meditation and so on (valuable for other reasons though they may be). And if you are lucky enough to just put faith in those ideas, even better - because then you can knowingly "take on the shape of" the experience of openness. This is really a case where the more of a thinker you are, the longer you can end up delaying the actual direct knowledge. You are play-doh and haven't realised it; the only way to realise that you can adopt a different shape is to... adopt a different shape.

POST: Awareness and the nth dimension

The mountains in the distance can be no further than my experience of them, and nothing is closer to me than experience. The world has no depth!

But it can definitely take a while to stop "seeing your ideas about experiencing" - e.g. seeing distance as independently real - and sometimes I quite like playing with ideas like "selecting a 3d scene from 5d space" and living from them for a bit. I wouldn't say they are approximations though; surely they are applied patterns, active metaphors which actually shape experiencing if you are operating from them?

However, I think OP was talking about exactly that form of spatial-dimensional thinking. Your response about "only ready to experience them after a walk" seems to misunderstand what I'm saying though?

I am experiencing the mountains instantly, at close quarters, even as they are "smaller and less detailed" than they might be. Walking has nothing to do with how close I am to the mountains. The experiencing of walking may occur between this experience of the mountains and that experience of the mountains, but the experience won't get any closer than it already is. It will simply change in kind. This is just a matter of the nature of experiencing, nothing to do with habits and commitments or abilities. Our interpretation of the experience might change of course, giving it certain apparent qualities, but the world still has no depth (=experiencing has no depth). I'm not sure where you're going with the wall-eating-levitating stuff here? Or was that based on another interpretation of what I was describing?

Ideally I think we should talk about possibilities going from middle to stratosphere.

Just to emphasise though: the "world has no depth" and mountains comment says nothing about what can be done (you have extended it to that though), it is a comment about literally the nature of the experience. A dream about faraway mountains that are a 5-day hike away, still involves dreaming a 5-day hike to get there - however you recognise during it that you are not going anyway, it's just that your experience is evolving. Leveraging the knowledge about the world (beyond the simple relaxation that comes with it) is another step. On Effortlessness - Effortlessness doesn't mean you can just discontinuously alter everything right now (although potentially you might be able to). It does mean that the changes you do make will not involve effort. Effort is an experience, it is content. If you experience effort, it's an additional thing you've created on top of what you were focused on. Now, spending time - that's something different. I think that's what you mean by "effort". You need to spend time exploring yourself, finding that you have patterns which stand in the way of certain experiences you'd like to have, and so on.

I think you're trying to emphasise: Just because you understand the nature of things, doesn't mean you are suddenly going to have Super-Ultra-Wizard™ experiences. This is true. Having the correct map doesn't automatically let you redraw the landscape. Often the response to being told that "everything is consciousness" is something like "well, why can't I just fly?" - if this is a dream, why can't I just do anything right now? The answer is: **Because it's a dream about being a person in a world made of atoms and gravity.**

Everyone is going to have to spend some time changing the formatting of the dream. And in fact, some things may be so ingrained into the foundational pattern of the dream, that you'd have to detach from it and seed another one. The reformatting will itself be effortless (in the sense that you won't be using force to make the changes) but they will still take time (bringing out aspects and refashioning them or more obscure intentions will take take to come via apparent plausible paths). Actually, that's a good rule to focus on: The spontaneous content of a no-depth world is limited by plausibility from the perspective of the dream character. Anything could happen in the next moment, with no background occurrences leading up to it, however it will always seem plausible-if-unlikely. Only by restructuring the conceptual patterns we have adopted can we allow for increased unlikeliness.

On the first part, certainly - you know my adherence to the felt-sense approach to capturing this.

Effortlessness shouldn't make anyone feel, well, stupid. It's a description of the experience when it happens properly; it's not a chastisement for not being good enough. It's just what we want to shoot for. Because any effort inherently means the retriggering of previous existing patterns - the experience of effort is the experience of reasserting a pattern and then trying to overcome it. So effortlessness is "what doing it right feels like". It will take time to get there, and colloquially we might say that it will "take a lot of work". There are other words we might use: "should not involve using force" and so on, but they all have their baggage.

On the rest - I'm saying that simply recognising it's a dream doesn't mean you can instantly "fly". However, that is the first step to even considering you might make changes. You don't just wait for it (although I think even recognition does soften the habits of reality over time) you can now sift through the patterns or assert new things - it will be "effortless" in the sense that effort you apply will block your progress. It's like asserting being-sat-down while intending to be-stood-up. Opposing directions!

So, "making things plausible" is exactly the approach indeed! :-) That's what all that patterning stuff is about.

Perhaps we need to go into specifics here? Let's stick with the sitting and standing ideas, since the (apparent) body's habits is a good place to experiment.

- **Effortless State Shifting:** If I am in the seated position, and I want to stand, I can simply Just Decide or recall into experience the pattern of being-stood-up, and I will translate to that state. However, most people being by re-asserting the being-sat-down state first, and then perhaps assert intermediate stages while holding onto previous states. In this way, the process is experienced as being effortful. If instead one simply asserts the final state, experience moves effortlessly towards it - one they've released a hold on the previous state. Initially, this can take a long time. And since releasing isn't something you "do", the experimenter who tries to work out "how" they did it, can get confused when they try and make it happen again. So this is where spending time explicitly working on held patterns can be good. Because most of us have, over time, got into the habit of continually re-triggering out current state, re-triggering being-a-body-in-'this'-arrangement.
- **Releasing Held Patterns:** So, one thing we can do is spend time explicitly releasing-dissolving persistent patterns. That's where Overwriting Yourself and related approaches enter the picture. By lying down on the floor in a fully supported position, and completely letting go of mind, body and attention (letting them roam as they will) we can release ourselves to a fully self-supporting state, and then eventually the "non-pattern" of not actually maintaining a present state at all. This process is not effortful, in the sense that you don't use force and you don't try to push through to a different state (because you will likely begin by reasserting the initial state to do so). Rather, you operate either passively - where you simply allow everything to unfold and settle out in time - investigatively - you go looking for a particular pattern, so arises in awareness, you let it unfold - or active-assertively - in which you assert a state of complete openness, and when the counter-elements to your state arise in awareness, you simply be with them and let them unfold by themselves.

So in both cases (really the same case in different contexts) we spend time to work through our accumulated "facts", but we don't use effort (as in force).

I think you are bringing to it more than I am intending to give from it! Separately from that, of course they are all good points.

I'm not forgetting all the other sense, of course; that's why I often call our experience of the world a "3D-immersive multi-sensory thought". It doesn't matter for this, however: the point is that all experience is intimately close, made as it is from yourself, regardless of the nature of the content. The world's depth has no necessary implication on its ease of change - other than emphasising that everything about the world is, contrary to first impressions, here and now and always. It opens possibilities, but it does not say how exactly they are enjoyed, except that it must be effortless because effort is content and "second-cause" content is not required. It does, however, let you have "right-formatted intention" because your intention is based on the world as it is as an experience, not as you think it to be as a "place". That's not to say it's easy from one's current state to just do anything - of course not! - but the process itself cannot involve effort. Perhaps the main difficulty we all have is ceasing to push and hold on, and with that the fear that goes with completely abandoning everything for a discontinuous change. Even a slight maintaining of a pattern keeps everything in place, right? Hence all that gnosis stuff.

However, we should remember that: Right-experiencing is a value in and of itself. In fact, many if not most traditions don't go beyond this.

I don't think we live in a 3D world. We live in a world with some 3D data in it.

Right. It's the immersive thought that has a spatial component in the experiencing of it. Nothing is actually "located" anywhere except in a relative informational sense, conceptually speaking. This is exactly what I mean by the world not being "spatially-extended". The room next door is not in fact "over there" when you are not having an experience of it.

On depth: The value of it is in the massive expansion of plausibility. Right now, you could open your door and anyone at all could be stood there. There is nothing "happening" outside your experience right now. Nothing at all. The only definite fact is the current sensory "observation", although we have accumulated other contributions too. If one can truly accept that only now is the definite fact, then I feel that this is the most expansive our "plausibility sphere" can be. Again, "effortlessness" is what to shoot

for. Yes, in a sense, we do practice and we "do nothing" to make things happen. Hence the Just Decide exercise. The experience should be of things doing it by themselves. Any effort you put in is actually against your goals, because it is a sign you are retriggering the current state and then trying to overcome it.

Of course right-experiencing is a value in and of itself. To literally and directly experience this moment as sensations, perceptions and thoughts floating in consciousness is absolutely important. It shows that the world is... not even subjective. This is both beyond aesthetic (it is the plain reality) and supremely practical (if you are operating from some other basis, you are shackled).

POST: Any tips, tricks or texts on remote viewing?

You should so have let it happen. Well, depending on the target of course.

I'd prefer to avoid the future...

It doesn't necessarily enter determinism as such, right? Only the future as it will be if you don't re-intend it. What you will experience if you don't make changes.

Something to contemplate:

In the old science fiction stories of teleportation, there was the concern that since the original copy of you would be destroyed, and it would be a duplicate that would appear at the destination, you had killed yourself. In this form of teleportation, it is the world that is destroyed and created anew, as you are effectively translating your viewpoint to another position on the 'Infinite Grid'.

Have you ever teleported T-George?

It's (exactly) as if one line of thought starts to fade and another becomes brighter, more immersive, and if you let it fully snap into place, you're there. But this involves the previous scene including your bodily presence fading out and being replaced; your body-experience is part of the environment-experience that changes. This makes sense, since generally you are "viewporting onto" a configuration rather than being a body physically in a place, but -

No, I've not let it follow through either in that way - because it wasn't at all clear that that's all that would shift, right? However the difference is probably one of entering a thought that one comes back from (OBE/LD) vs one you do not; there is a difference, of intent I guess. It may actually be better not to have thought so much about reality. In ignorance, you just have remote viewing and maybe a teleport and are none the wiser. In knowledge, you have to confront the fact that by doing this you are leveraging a different concept of what "the world" even is.

I think experience is self-organising though. There aren't rules, so much as ingrained habits or patterns, which become entangled with one another. Which is why things don't need maintained: experiences arise spontaneously in accordance with the current distribution of activated patterns. What we are doing here, is using the fact that it's possible to intentionally change what patterns are more active. I think the problem isn't so much that you might break habits that you like inadvertently (although this can well happen), it's that the very recognition of the possibility shows you that these habits weren't real in the way you thought they were anyway. Your friends aren't in fact stable consistent separate people with an existence independently of yours; events and people don't even "happen" when you aren't observing them; etc. Your "higher self", then, is just you with a widened POV; there is no-one "doing" anything; widening your POV will certainly give you easier access, the equivalent of extra dimensionality as it were, to go around-through obstacles. But that itself may be an uncomfortable reality breaker for many, who prefer to think in terms of guardian angels and designate some experience accordingly.

The short version is: to use these insights you must effectively commit to the idea that you have a "private copy" of the world.

EDIT: By "you" I don't mean you specially, I mean "we" or "one". Just realised this read like a presentation speech! It's meant as general thoughts I am having.

So yes, it can be said to be self-organizing, I just can't seem to fathom how it possibly organizes.

It's not easy to describe, but I think of it a bit like how layering two patterns over each other combines into a new pattern. Nobody "made" the resulting pattern, it just naturally emerges from the patterns that have been laid down so far. So wherever you look, there's always an experience apparently ready and waiting for you, since that "space" is already occupied by a combination of all the patterns or observations you have accumulated so far (previous events and previous thoughts).

On the one hand, powers are awesome, on the other hand, I know that if I can simply instantly have everything I want then, well oddly enough nothing really changes.

Completely agree - if that's what we would do. But I think what happens is, you start realising that you never really wanted to (say) actually own anything - what you've always wanted is to have certain experiences and not others. So, you don't really want to own a Tesla Roadster, you just want some of the experiences that go with that ("driving a Tesla" not "doing garage maintenance on a Tesla"). You don't really want to be rich, you just want some of the experiences that you think go with it ("not worrying about money", "doing what you want" not "handling investments, avoiding corrupt accountants"). A lot of our desires are about not needing to worry anymore, to feel safe. With this (oneirosophic) understanding of our worlds, that can go away: we can always feel safe (potentially). The most important thing is that by knowing how it works we can avoid accidentally generating experiences that we don't want, and realise that: **All experiences are real-at-what-they-are.**

Maybe lucid dreams are a good example of this. In a lucid dream, do we just start summoning various objects and then sit back on our sofa? Do we just go to parties or play golf?

No... just like you say, we go on adventures!

you could practice consciously controlling what you view when you visualize the card or whatever and deciding that is what is out there in the world.

Such a good point. If you think of the facts-of-the-world as the being accumulation of observations so far (and in logical space their implications), then this is about right. When you look at a location in an "undirected" way, it is creation-by-implication - the content of the observation is "filled in" according to whatever patterns are active in that context. If you do so in a "directed" way, which really just means that you are holding a particular pattern in mind when you do the looking, then you are deliberately selecting the content of the observation. Since new observations that are created by implication will always arise in a form coherent with prior observations (the world always "makes sense"), and every new observation re-triggers and entangles prior observations, it's a good idea to take deliberate control of anything important - since revising it later (although possible) is more difficult.

It doesn't matter whether the "observing" is sensory (main experience) or shadow-sensory (thought), they both count as part of the definition of the world, except for the intensity of their contribution.

(Related: All Thoughts Are Facts.)

POST: Are we immune to reductionism just because we like subjective idealism?

I take the view that concepts are always just relative truths?

There's never going to be a description of how things really are, because that already is a description - to describe it would required another description of equal or greater size. We'll never have a TOE as such - because that is basically the definition of a world, and we're surely against such definitions here except as tools? What we can have is a metaphysics where we, say, talk of patterns in the general sense and come up with better ways to lead people direct experiencing. So reductionism of some sort is inevitable - the difference it that we are not confused into thinking that it corresponds to "the truth". Instead, we might view them as active metaphors: patterns of description which themselves have a shaping power over experience. We are never just explaining something, we are defining it and deforming experience with our concepts - but the subjective idealist is aware of this. They are aware of the impossibility of separating a fact from a description. Meanwhile, all the senses and the felt-sense and spatial-extent

and all that, they're the same thing (experiential content) and to focus on any one is to deform experience. It's all-of-a-piece. (Just notice how quickly people knacker their vision by trying to see visuals instead of have perceptions.) But that can't be captured in words, and so the visual sense tends to get used in discussion because it is easiest to describe in language and can be presented in a verbal or literal diagram better than any other, due to the persistence of a visual experience.

I don't think it's an easy way out - it's simply how things are? The nature of experience dictates it. Spatial extent isn't a thickness, it's actually "flat". There are lots of other "depth-type experiences" one can have too, but they are just that again. To be clear though, "the world has no depth" is more about there being nothing "happening" behind what you are experiencing, rather than just the idea that there's no distance between you. It certainly has no spatial extent other than the experiencing of it, but also there is no deeper world in the same way you are experiencing it. It's that old thing of the world not in fact being a "spatially-extended place unfolding in time".

To reuse a tired analogy:

- You are watching a TV show. There's a scene of an office. The door opens, and a man walks in. "Elevator was broken, had to walk up the stairs", he announces.

Did he actually walk upstairs? Was there even an elevator beyond that door? In what sense does the man even have a history, in what sense does he "happen", prior to opening the door and you seeing him onscreen? In fact, in what sense are the events after the door opening even "happening"? In what sense is that a man, other than my concept of a man?

So we should definitely look into things deeply, but the way we look into them isn't in the manner of investigating "real world", right?

[The Reframing of "Thickness":] The advantage is that now the thickness is accessible instead of being "out there" beyond reach.

See, I'm not very happy with repurposing the word "thickness" for this. Although there's a natural problem that every word we use will imply a spatial metaphor. What matters is the complexity and entanglement of the patterns; that would perhaps correspond to your use of "thickness". That's why I've turned to phrases such as "patterns" or "accumulated observations" or "dimensionless facts", depending on context, to describe the nature of the world - dissolved into the background awareness. In truth it (the unobserved world) doesn't exist in any way that can be sensorily conceived of; although we can say it is dissolve in the felt-sense perhaps. This means we can jump straight to no longer viewing the world as a "place" in the way we have habitually assumed it to be. Anyway, as you have indicated, what's important here is that it means all contributing facts are available, here and now. And this means we can "re-observe" things we don't like, and adjust them. Furthermore, we no longer need feel obliged to believe our sensory experiences, or thoughts, since they no longer represent anything; they are simply a reflection, an aspect of, our present extended state.

[A Man Takes The Stairs:] There would be a narrative for what happened while the man was absent. And this narrative isn't something trivial per se.

I think you exactly can adopt the view that there's nothing "behind" your present experience, in the sense of their being an environment that is "happening". You can assert the truth of it until it takes root and you'll find your experience shifts accordingly. And that's a key thing, right? There is no technique. There is no way to do things, or even a possibility of doing things, other than the shifting of state. And the way you change state is... to change state. There's no other way or approach. Questioning things and saying things to involve a state shift to some degree - it's inherent in the experience - and if you kept at it that shift would become stronger and one view would become "brighter" than the others. But it's a long way around?

We're just exchanging different words for the same thing. Some would equate the word "contemplation" with thinking-about, which would be wrong. Some would equate it with maintaining-in-mind, which would also be wrong. But I know what you mean. Your "contemplation" is my asserting of state. And your concerns about contemplating North and South simultaneously corresponds to my example of triggering the state of being-sat-down while asserting being-stood-up.

Again, we still come back to: detaching from one state while bringing another into experience. And since there's no way tell anyone how to recall something, there is no technique, there's not much we can say about it. As our old pal said in The Art of Dreaming:

"To intend is to wish without wishing, to do without doing. There is no technique for intending. One intends through usage." – Carlos Castaneda

Yes, we may as well stop contemplating physicalism, because you can never "solve" a point of view in order to get to another. We must leave it behind, and adopt a preferable alternative. Only by doing that do we discover if it works - but we have to do so fully, which is not necessarily an entirely comfortable proposition for most/anyone.

How, exactly? That's what's so tricky! Our conversation is an example of that, I suppose. We make a good effort though, I think. :-)

I suggest that all we can do is offer analogies and metaphors, until we come across one that clicks, one that's the nearest to the experience - on a case by case basis. Although we can say what not to do clearly enough. This is an area that requires the experience; just as talking about everything being "consciousness" doesn't really mean much until you've had that experience of openness.

Okay matey. Enjoy your dreaming until next time. But watch out for mountains, please - they sneak up on you. They're much closer than you think! ;-) Cheers for now.

POST: What are some of the implications of personhood having no substance? I'll talk about how I understand this.

Very clear, a good read. I would maybe offer one thought:

In fact, in this very moment, just how many Nefandis live in this very body?

If we were being more precise, might we instead ask:

- "How many Nefandis (conscious perspectives) are accessing the experience of being that body in those circumstances?"

Because Nefandi isn't "in" a body, it's really that a particular experience has taken shape "within" Nefandi, or rather what-Nefandi-really-is. And that answer would be, any or none - because (to use a poor analogy) the number of viewers watching a TV show is not limited by the show itself, only the number of viewers. An extra answer would be, infinite - because an individual moment of "being a body in the world" exists outside of time. The number of "experiencings" of that moment over all eternity would be uncountable and, essentially, simultaneous. I'm referring to "at time of broadcast" here, to be clear. (The show itself was never made, in a sense it has always existed.)

But then, as the next version of the answer clarifies, since this is outside of time or at least there is no relationship in time - there is no "George watched and then Nefandi watched it" - every program will "eventually have been / has been" seen by everyone. The additional part would be, there aren't any "ones" either because it doesn't make sense to talk of two consciousnesses when they cannot be distinguished between. But that's more something that can't be talked about.

So because we know we can switch, of course we subtly know more than what meets the eye.

Yes. In more practical terms, there is no distinction in type between being able to conceive of something and experiencing it. If you can think of something, then it can become an immersive experience. To know that a TV show exists is to be able (in principle) to be able to seek it out and watch it.

Just because time is endless doesn't necessarily mean you get around to watching everything possible.

Yeah, I always try to tread carefully here. More specifically, I'd say that "every program" that has been conceived of does logically exist (simply be definition). It has therefore in a sense been "seen" (thought of) - but that is not to say it has been "watched" (been adopted as an immersive experience). This is a little hard to talk about because in discussing it we imply an objective view - a space in which "every program" exists. But in truth it is more claustrophobic than that; it's not any program, it's every program that is logically implied by the current state. You can't "see outside" of that - for the attempt to do so creates an "inside" by implication.

Agreed with all. All things are here, now, just in relative states of brightness, different levels of contribution. One's present experience is then the total of all prior "observations" to the extent that they remain active/bright. This understanding is where the hope for deliberately directing one's "reality" comes from - diminish so-called previous observations, introduce new ones, and so on, to "rebalance" reality or simply assert a new pattern. Importantly, it means that the next-moment need not have any

logical causal connection with the now-moment - other than that one has conceived of it.

Prior, future, and parallel. :) Not just prior.

Aha, well quite!

So, that's the interesting area: emotional readiness for discontinuous change. I'd equate that "readiness" with a willingness to release a hold on the current experience almost completely?

So, if for convenience we maybe think of "emotional state" as being a collection of bodily sensations, then the only states you will be able to shift to are states which also contain those bodily sensations. No happy states while you are holding onto your sadness, to pick a clumsy example. Since it seems relevant to the "multiple experiencing" aspect, and it's the closest I've got to writing a description of world-sharing in metaphor:

The Hall of Records

Imagine that you are a conscious being exploring a Hall of Records for this world. You are connecting to a vast memory bank containing all the possible events, from all the possible perspectives, that might have happened in a world like this. Like navigating through an experiential library. Each "experience" is a 3D sensory moment, from the perspective of being-a-person, in a particular situation. And there may be any number of customers perusing the records, and any number of customers examining a particular record. So this is not solipsism: Time being meaningless in such a structure, we might say that "eventually" all records will be looked-through, and so there is always consciousness experiencing the other perspectives in a scene. At the same time, this allows for a complex world-sharing model where influence is permitted, because "influencing events" simply means navigating from one 3D sensory record to another, in alignment with one's intention. This process of navigation could be called remembering. Practically, this would involve summoning part of a record in consciousness and having it auto-complete by association. This would be called recall. You can observe something like this "patterned unfolding" occurring in your direct conscious experience right now. You are not even the person you are experiencing, you are simply looking at this particular series of event-memories, from this particular perspective. "Reality-shifting" means to decide to recall a memory that is not directly connected to this one.

POST: Subconscious mind is helpful and problematic for the same reason.

On the "effortless" thing:

...the way in which things are "effortless" is more in the sense of alignment of intention, lack of tension cause by asserting contrary states, and the sign of this alignment is effortlessness. Like the alternative term "non-doing", it is easily misunderstood as meaning not participating at all; people think "it happens by itself" is a sign to wait around, because you can't easily describe intending. [1]

Practically speaking, it is meant as a description of using end-state intention and allowing-unfolding, rather than simultaneously intending the end-state while reasserting the state-state or intermediate states. The common examples are intending being-standing-up, while intending the process getting-up-from-sitting (creates conflict). Or trying to solve an intellectual problem by intending it-being-solved while continually revisiting the it-being-a-problem state, and so never letting the pattern make the transition. Unfortunately, it (effortlessness and non-doing) really doesn't make a lot of sense to someone until they've had the experience, like a lot of the things we discuss here.

[1] Although actually, if you use the patterning description of experience, you can lead people to be able to assert end-states using their imagination in a way that makes sense and can be discussed. You can lead them to non-doing, although in my experience in most cases it has to be done in person, as you kinda feel your way through the explanation.

So do you mean in the sense that you have a "knowingness" that whatever you intend is going to manifest because your subconscious mind and/or universe works towards aligning with your intent, therefore you comfort your anxiety through this knowledge?

Sort of. Remember: The universe is dead. Only you are alive. All time is now. It is you who scan your attention across the pre-existing moments. When you intend something, the update is immediate: it is immediately true, incorporated into the pattern of the world. Your attention just hasn't got to that moment yet. So the reason to accept and know that "it is done" is because that's the truth, and so you don't then re-update the world into another state through further meddling due to doubt. Literally, everything that arises in your awareness is a direct interaction with the world, as the world. Passing thoughts indicate the current state of it (they are it). Deliberate intentions-thoughts define the current state of it.

POST: Can abstract dualistic matter exist?

[POST]

I'm reading through the Three Dialogues and got past the bits about the impossibility of abstraction, but I didn't feel like I grokked it, or that abstraction was given due diligence. I also feel like matter is too often dismissed in the book simply because the sensory experience of it is contingent on the mind. Let's pretend that we live in a dualistic universe. Let's pretend it's just you, me, and a single other piece of matter to observe. To really simplify things, the only thing that we can observe is this piece of matter, and we can't observe it from other perspectives... because we're tied to rocks in Plato's cave. This piece of matter works like a function of both its own properties and the properties of the observers. When the piece of matter is observed from my perspective, it outputs a "0" and I experience that "0". When it's observed from your perspective it outputs a "1" and you experience a "1". So our experience of this dualistic object is contingent on our own mind, as well as its own spooky properties. This is analogous to me and a dog looking at a rainbow, and each of us seeing different colors. I know nothing about the structure of this matter, except that it imposes consistent sensory experiences on an observer relative to its own properties and the properties of the observer's mind. f(own_properties, observers_properties) = experience!!!! Isn't there about as much reason to suppose this matter exists as there is that our sensory experiences are contingent on a greater god-mind?

[END OF POST]

I'd say your story already begs the question; it presumes the existence of something and then creates an image based on that something, in an attempt to prove or disprove it. Some thoughts:

- In what way do we ever experience matter?
- How exactly would the boundary between matter and mind be breached? How would they interact with one another?
- How can something have properties other than those that arise in experience? Where do those properties exist?

Certainly we can conceptualise additional objects and patterns and properties to form an explanatory link between observations, but they belong to mind and arise in experience too, and don't belong to some external thing (except as the concept of "an external thing"). In other words, matter "exists" only as a fictional story to connect sensory experiences. Unwitting reification of abstractions is one of the worst habits we can have.

EDIT: The additional part is that what we call "observations of objects" are themselves collections of ideas and their extended patterns.

A Reformulation

Perhaps you should reformulate your question, which is in fact:

- *"Is it possible for me to have experiences as if there was such a thing as matter?"*

The answer is, "yes".

Then you should ask:

- *"Does that mean there exists such a thing as matter, other than my conception of it?"*

The answer is, "no".

One of the problems with personal experience is that it has the property of aligning with our current worldview. The fact is, that if you adopt almost any philosophical position, you will start to experience the world as if it were true. Only by personal experimentation can you demonstrate this to yourself. If you genuinely adopted the notion that only mind exists, your thoughts and experiences would quite quickly fall into line with that view. But that makes us ask: what is the "real, essential truth" then?

The Truth(s)

For the sake of discussion, and simplifying by division, we might say there are three types of truth:

- *Direct Truth* - The immediate experience you are having right now, without analysis. The only definite fact is the content of your experience at this moment.
- *Conceptual Truth* - The is the 'truth' of having a self-consistent conceptual framework which we use to describe the world. This does not necessarily have many contact points with direct truth; it can be a 'castle in the sky'. The more contact points, though, the better.

Since the content of direct experience is changing all the time, and content of conceptual experience is arbitrary, then neither can be the fundamental truth. The absolute truth must be unchanging.

- **Absolute Truth** - The only definite truth is that experience is being experienced. In other words, that you exist and "are". Essentially, this is consciousness. It is the only certainty.

So all truths apart from this one will in fact be relative truths. "Matter" is a conceptual truth, a self-consistent framework, but one with minimal touch-points to direct truth because it supposed an external view beyond what is possible to experience directly. There are in fact many ways a world can conceptualised in any number of equally coherent ways. But none of those ways are "out there" in reality, they are "in here" in thought.

The Conceptual Question

Finally, let me suggest a way to tell whether a conceptual framework is approximating direct truth, rather than simply being a connective fiction:

- If when thinking of your conceptual truth, you see it from an objective, 3rd-person view, the "view from nowhere" - then you are immediately wrong, and all that your are imagining in that view is a complete fiction disconnected from direct reality.

It would be an interesting exercise for you to pause right now, and think about "matter" and how it interacts with personal experience. Probably you have some sort of vague imagery that appears in your mind at that point, perhaps a little illustration or diagram or example. You should write down a description of that imagery.

...

What do you mean "who am I"?

I'm simply presenting the common argument that is used, the logic supporting that position. The basis is that anything that has ever been observed interacting has had a commonality. If instead of "interact" we say "push against one another" then it becomes clearer. Only things which share a common property can push against one another, otherwise: what is pushing against what?

(If there is no commonality, then you have to propose an intermediate processes which contains aspects of both and acts as a bridge between the two - but then you have implied there must be an additional type which underlies that, something which underlies mind, matter and the bridge.)

So we end up eventually with the idea that matter must have a mind-aspect or mind must have a matter-aspect. Since we only ever observe mind, then it would seem that matter must have a mind-aspect. Furthermore, since we could never observe a non-mind-aspect of matter, it exists only in our concepts. Effectively them, observable matter = mind. Hence, there is only mind.

The short version is: Anything you can't directly experience, is something you are inferring, and cannot prove the existence of - you can only demonstrate the usefulness of it as a fictional concept.

The even shorter version: Matter is not impossible, but it is perhaps pointless!

I reckon that if we keep going at it, what we'll discover is that we do agree entirely, it's just that we're cutting up the world differently; our experiences are the same, we're just categorising them into parts in different ways. :-)

To wrap up a couple of stray points and go around one more time for fun:

- I'd suggest that in order to recognise that two things are affecting one another, a commonality has by definition been established of some sort. Even if that commonality is simply that they are (say) both "patterns in consciousness" in the same way as there is commonality between "folds in a blanket".
- We can have commonality without cause and effect. In fact, I don't believe cause and effect is a very good model; I think it's better described as an account with partial observations of a larger pattern, etc.

We probably have to define what we mean by "exist" to get any further. It does depend on the level at which we're talking. If I'm saying matter is essentially a concept to us, does that mean matter doesn't exist or cannot exist? That's a reasonable question. (The other was "does it matter?", pun-fully, which speaks to my short version!)

Concepts do "exist" as concepts, as thought-patterns. And one could look upon our ongoing sensory experience as an "immersive thought". And so experiential patterns are themselves "concepts" or "collections of ideas" in Berkeley-speak. So "matter" does exist as a concept-idea and one which is experienced in a way... but only in the same way as "a vase" exists and is experienced, which is only as a concept-idea... and which is associated with certain sensory patterns, which are also concept-ideas. And so on.

We are left with: okay, it turns out that everything exists at least as concept-ideas, so what are concept-ideas made from? And the answer is something like "awareness" or "consciousness" or "experiencing" or... mind.

So again we're back to a commonality, and to mind. But it's a commonality in the sense of different folds, as concept-idea patterns, belonging to the same blanket, as mind.

POST: Oneirosophic music that cultivates the feeling of lucidity.

Nice selection. Music, yes, completely. Oneirosophic Soundtracking™. Coincidentally, I was already listening to Boards of Canada's The Campfire Headphase when I clicked on the link - I find their stuff and Plaid quite good for background mood-setting. Also some Moderat/Apparat remixes:

- Seamonkey - Moderat
- Tomorrow - Ladytron (Apparat Remix)
- A New Error - Moderat
- Milk - Moderat

Yeah, I like Moderat, their Bad Kingdom video is one of my favourites in the last few years. Those were quite pleasant. Remind me a bit of classic atmospheric drum 'n' bass like Omni Trio's The Haunted Science album - dreamlike with a persistent beat, good for traveling. Kinda stripped down and without much in the way of effects. EDIT: And liked that last video.

Organic, yes. Really I think there is a sweet spot where drum and bass, atmospheric electronic, and hip hop meet up. Things that are "soundtracky" in particular.

...

The Devin Townsend "drone" albums are good - thanks for the tip! If The Field's Sound of Light EP, which was meant as a soundtrack for Stockholm's Nordic Light Hotel, was less relentlessly intense, it would be like that. And I agree with the Terence Malick and Into Great Silence, particularly. The latter really puts you somewhere else.

POST: Dreams, Subconscious and the Goetia

In subjective idealism, all demons are "you". As is everything else you experience. (Using the word "thing" is perhaps slightly problematic, since it is often taken to imply an "out there" spatially extended place with objects in it, that are "happening and unfolding in time, but we'll let that pass.)

So you can make up anything you want and have it behave however you want, potentially. If you choose to imagine that there are demons and they do such things, then you will have experiences "as if" that is true. You'd have to actually define what you mean by "subconscious" and "greater collective subconscious" to go further than that, within a larger context. Here, I would suggests that "subconscious" is just a word for all logically sensible patterns which are activated to a greater or lesser degree within your perspective. "Conscious" is the brightest pattern at this moment, obscuring the other patterns (think: the sun shining in the daytime sky, obscuring the stars but the stars are still there). "Greater collective subconscious" would mean all patterns in logical space, full stop (think: all possible locations in the sky where a star could be).

[have it behave however you want.] Not if you imagine it has some independence or free will.

I would count that as part of the original "imagining" though. You should be careful and specific, definitely. Certainly, once you've set something in motion, it can (apparently) be operating under its own steam. Although I would view this as the pattern of that thing being overlaid upon subsequent experience. The problem is that this happens "by implication" or association.

For instance, you summon a particular Greek hero for his strength and wit, knowing it's "all you", but forgetting that doing so also triggers all the associated patterns, and you subsequently find your music tutor dead with a lyre embedded in his head.

POST: The Mental Tendency of Preferring Multiplayer

In discussions elsewhere about subjective reality and influencing reality, a concern that comes up again and again is that doing so implies that other people won't be "real", or at least not independent. (The other version is where it's assumed that they are "real" now but that the act of making change will mean they won't be the same people afterwards.)

This "peopleness" issue might well be one of the main problems for accomplishing unusual things, and explain the "urge to forget" that occurs after spontaneous unusual experiences. For instance, witnessing objects vanish and reappear may seem like a small glitch of no consequence - but in the back of your mind you follow through the implications: that the world is not solid, stable, reliable, but instead flexible, randomised and arbitrary. If that can happen to objects, then it implies that perhaps any fact-of-the-world at all could change on a whim, including those relating to people. Maybe this is why it's often only under extreme and desperate circumstances that reality-shifts are experienced.

The world is dead independently of us, only we breathe life into it. Perhaps this is a fear of loneliness? Perhaps that's why we invented a world with imaginary friends in the first place?

Q1: *The world is dead independently of us, only we breathe life into it. Perhaps this is a fear of loneliness? Perhaps that's why we invented a world with imaginary friends in the first place?*

One of my earliest experiences with anything I'd call oneironautical was meditating in a dark room after having eaten four grams of dried Gymnopilus luteoviridis. The hallmark of the experience was an overwhelming, metaphysical, inescapable sense of loneliness. It was like masks had been pulled off of everyone I'd ever known (or could ever know) and they were all just reflections of my self, devoid of any -genuine- otherness. And that devastated me to such a degree that I decided, "There's a very good reason I decided to be a human. Realizing you're It is not fun. It's way more fun to be a human." And I stopped meditating or doing drugs or contemplated anything important for... months, definitely. Maybe upwards of years. I wasn't ready for that at all. And it didn't just mean that I wasn't open to that realization. It pushed me, repelled me backward, stunted my progress, took me out of the game for a long time. Cultivating your sensibilities, molding your desires and tendencies, and learning how to subtly establish your own, internal sense of validity (i.e. some kind of ultimate Otherness is not necessary for something to be just as valid as you feel it to be right now) is one of the absolute most important aspects of spiritual progress IMO. Maybe the most important.

I think /u/3man had a similar drug-related experience, but it was more of the sort of a character telling you how it is; he felt the potential horror of everyone just being our puppets too. Can't find the link right now. Yes, I think that having a right worldview, and a shifted perspective of what "meaning and purpose" are, is required before being fully exposed to this. For instance, many people's response to the oft-banded theories that "this is a simulation" is that it would make their lives pointless. Similarly, people who accidentally have lucid dreams and just wake themselves up because "it's just a dream". They rarely seem to interrogate the underlying assumption, the assumption that things "being made from atoms" is somehow inherently more meaningful than things being made from information or dream-stuff. Are solids more meaningful than gases? Are rocks more meaningful than oxygen?

If a person hasn't addressed these things, then even straightforward philosophical idealism will be problematic for one's identity.

cosmicprankster420: *To me the whole point of oneirosophy and lucidity is to have the freedom to create any kind of experience you want for yourself not to come to some ultimate realization that this is all some kind of solipsistic nightmare that we are trying to forget. You are making the mistake of assuming there is some kind of ultimate reality, but the way I see it is that neither the realm of otherness or the realm of just me ness are ultimately real. To say that one realm Is the real one and one is illusory creates a kind of objectivity because in order for something to be real something has to be unreal and vice versa. I was definitely going under the solipsism trip for awhile but I then realized if everything is subjective and not ultimately real then solipsism isn't real either. I think what our mental tendency actually is, is having a kind of foundational primary worldview in which everything stems from. To me being an oneirosopher is about being a kind of metaphysical nomad moving effortlessly from one type of dream to another via there lucidity and if you are stuck in one type of dream like atheism, Christianity, or the case of solipsism then you have actually lost some of your lucidity. It is realizing that if nothing is real then nothing is unreal either. The idea that everything is lifeless hologram under your control is no more or less valid then a world of otherness and others the former is simply more practical when it comes to controlling things. But if we say that one type of experience is real (being the only thing that exists) and one type of experience is unreal (there are other independent minds out there) then we are actually disempowering ourselves in terms of creating the types of dreams we want because what if we really want to create a dream where other independent minds exist, if everything is just us are we not able to or allowed to create that kind of dream? That's limitation to me paradoxically. I think instead of trying to come to some ultimate realization we need to learn how to switch back and forth at will from these perspectives because both the everything is me perspective versus the there are things independent of me perspective both have their own uses, but we should be very careful about fully committing ourselves to one dream to the point that we forget we have a choice.*

Yeah, the only "ultimate realisation" is surely that there is no fixed truth in terms of content. No content-based realisation is ultimate. I think people sometimes confuse "nothing is real" with saying that experience is hollow, that there's no aliveness. But that's misinterpreting it as " 'nothing' is what is real", that reality is nothing. In fact, if you-as-consciousness is shaped into the experience of being a body in a world with other people, then all of that is alive, is intelligent, formed from your aliveness and intelligence.

So oneirosophy becomes the recognition of the ability of whatever-you-are to take on the "as if" experience of any relative truth.

cosmicprankster420: *misinterpreting it as " 'nothing' is what is real".*

POST: I've learned how to wake up, but I'm too afraid to do it

It doesn't mean loss of identity - it means recognition of identity and context. It's like you've been watching a TV show all your life, confusing yourself with one of the characters - and then one day you relax, your attention opens up, and you discover you're actually a guy on a sofa in a nice apartment holding a TV remote. And you always were that guy.

Now, that initial opening up might be uncomfortable; it'll feel very exposing at first, but that's just like how tight muscles are uncomfortable when you first unclench them. It's just like a lucid dream: you realise you are dreaming, and then you realise that this means the "you" that is dreaming is not the dream-body or perspective, it is the whole "space" in which the dream experience arises. The experience of awakening in a lucid dream is truly freeing and exhilarating. For starters, you understand that your intentions have global effect, not just local body-movement effect. When you decide to go to the grocery store, it isn't that you bodily move there - rather, the whole dream shifts towards the experiential state of "you-being-at-the-store". Meanwhile, it's incorrect to say that the dream "happens" at all. Nothing is "happening" while you are not experiencing it, although we infer it must have from our observations. Reality isn't this other thing that does stuff, like it has a separate intelligence operating independently of you. That's too movie-ish.

Short version: **You don't need to worry.**

Q1: Hey, George, I've been reading your theory on so many occasions now and I'm grateful that you keep sharing it. Something is kind of itching me though, and I would like to directly address it. "Reality isn't this other thing that does stuff, like it has a separate intelligence operating independently of you." - that, and other such ideas, imply that the whole world is "my dream". Okay, maybe we could say that, but then why does this dream follow it's own routes in so many occasions? For example, I would like to have this monetary system off the table, and have all the people on planet Earth to be conscious, generous and kind towards everyone and everything. I would like to have my country run by strong people who really do well for it. I would like to have us able to travel in space right now. Why are these wishes not true already? Why does it even seem that it could be the exact opposite coming to reality? Is it my fault or is this way of thinking just a kind of mental disorder? Please, clarify! I bet you know what I'm talking about. :)

Hey! Getting straight to the important stuff, I see! So I suppose we should start with a question: Why do you expect that those wishes should be true already?

Q1: Because in my dreams things change instantly "on demand". Let's say this "physical" world might have a bit of delay in manifesting desires, partly because we have too many of them and have a hard time focusing. Maybe that is one of the reasons things are so messed up - because we don't really know how we want them to be? You have said about the various patterns which "reality" manifests and I agree with that theory, but what if my desire is to remove some of those patterns entirely? Anyway, how long do you expect that it should take to manifest if I intend those wishes right now? The current situation shows that it might take a bit too long, if it ever does happen, and I might not even be alive to see some of the manifestations. What if my intention is to have all of this in a few, three to four years max

Well, this world has been around a lot longer than most of your dreams, and has become pretty stable - although you can create persistent dream realms and you'll find they operate very much like this one. You can indeed have on-demand changes though; any delay is due to "plausibility", related to the form of your intention, and that's something you could work on by examining your ideas of what the world is. (Just because you accept it's a dream, doesn't mean you've dispensed with the idea that it's still a "spatially-extended place unfolding in time" of some sort.)

Meanwhile, to remove a pattern completely, you need to remove all "amplitude" from it, but it's generally easier to abandon something and switch to a replacement, just as in a lucid dream you'll tend to open a door to a new scene, rather than morph the current scene. Anyway, as to your "wishes"...

How exactly have you gone about wishing for things so far?

Q1: So far I have put myself in a workplace where, although I spend quite a lot of my time, my work would bring those wishes closer to reality. I'm actually in a position where my influence could greatly expand, thus even further manifestation could occur. However, some things seem to be beyond my control, like what the EU, USA, Russia and such "great powers" decide for our globe. So far I've gone about wishing for their powers to be more and more diminished and their influence over people and reality itself to be lesser and lesser. I've just been intending that my country (somewhere in the Balkans) be too far away from their clutches, thus being able to become an independent, sovereign power. Still, not long ago, NATO put even more military strength around here, which seems to be quite the contrary to what I wished for. Also, the public seems quite powerless to all this, and this is also contrary to what I wished for. Perhaps my "wishing" has been not specific or ritualistic enough? I've read about the dimensional jumping, perhaps I should jump to a dimension where these wishes are closer to reality? Can I just jump to a dimension where they are already true?

The problem with these "wishes" is that they can be outside of your daily experience - and what your life is, is experiences and that's the key to selecting things. You have to identify what the actual end-state experience is that you actually desire. Vague notions of things often aren't helpful and can be contradictory. You also have to be careful what you wish for. For instance, your country becoming a sovereign state may necessitate NATO preventing other movements during the events of the transition phase. There is going to be a transition in time between this-state and the end-state. It also matters how you conceive of the world. If you really think that the EU, USA, Russia are "out there" and that they "happen" unseen, then that can be problematic. Those ideas become part of your intending if you "wish" in terms of those assumptions.

All of this is why manifestation approaches tend to, in some form or other, advocate deciding on the desire and then having faith and forgetting about it, by which they really mean do not define or interfere with the apparent means by which the desire manifests. Meanwhile, the so-called "jumping" approach will give you all the same problems if you don't have the formulations down pat; it's really just an active metaphor to allow yourself to let the world-pattern shift more drastically, it's a decision that it's "okay" if things change discontinuously.

So... make it specific in terms of an end-state and how it would actually be experienced. All manifestation must be about subjective experience, because that's all there is. Maybe pick one single thing and focus on that first?

...

A1: How are you going to wake up?

A2: He'll dream he woke up.

POST: All the Feels (Are Yours; Act Like It!)

Something that can be helpful: viewing bodily sensations, thoughts, feelings as part of the world rather than part of "you".

If what you (as consciousness) are having right now is an experience of being-a-person-in-a-world, then your preferences (which really about to feeling-states) are just part of that world-experience. Just because that part is closer to where you've typically narrowed your attention, doesn't mean that it is more "you" than other parts of the world. This leads us (hopefully) to identifying with the background space which takes on the shape of experience, rather than identifying with the experience itself. (Yes, they are the same thing, but the context is unchanging whilst the content is ever evolving.) It is much easier to detach, modify, release something when we aren't grasping onto it as part of our identity.

My garden is blossoming with purple trees, obviously.

Q: ==It is much easier to detach, modify, release something when we aren't grasping onto it as part of our identity.??
Actually two conditions need to be satisfied:
It's not part of your identity and it's within the scope of volition.
It's a bit of a contradiction, because we consider the so-called "external" world to not be part of our personal identity by convention, but because it's also considered to be outside the scope of volition, it's not easy to modify directly by will.
In other words, while whatever you want to modify shouldn't be what you are, it should be your emanation/imagination/activity, etc.

Yes. In easy imagery, I see it as not "standing on" the particular fold of the "reality blanket" that you are intending to move. But you have to see that the fold is within you and therefore accessible, without it being you and therefore not movable.

We can easily fall into language that has come to imply the opposite of what we mean. For instance, to make ourselves understood we might talk about how "everything is internal" - in order to dispel the idea that there is an "outside". But really we mean there is neither internal nor external, or at least that those are artificial divisions which divide a whole into parts arbitrarily. The use of internal-external then leads to misunderstandings on what subjective idealism would mean, assumptions of solipsism and so on, all based on trying to think of one perspective through the lens of another. And so on. There's a common thing where an idea is accepted partially, in such a way as to be "made safe" and less radical. One example is that Neville Goddard's instructions on revising the past are interpreted psychologically rather than literally, or with new-age swirlings about releasing emotional energy and so on. It's only half the message with the other half replaced by something more comforting, less philosophically disturbing.

Physicalists love your post.

"Materialists just won't believe number 4 on this list!"

POST: Techniques are a double-edged sword.

I guess that if you think of a technique as a straight up pattern-activation - using what's currently prominent a bridge, like triggering one memory via another by association - then it doesn't seem so bad. It's a way to get to an experiential result without having to detach from everything in order to create it discontinuously. While there is no technique to intending itself, getting to a result by intending the starting point of a chain of activation seems valid to me - and can be used in innovative ways. Yes, totally, particularly if one particular pattern becomes too "bright" and dominant, obscuring others. Since everything is "us", then all technique and cause-effect is fakery. So I tend to think that any move away from a "taking on the shape" approach (no cause-effect, we shift ourselves as ourselves as a whole), by identifying with one part of ourselves and using it to try and operate on another part, tends to intensify division. By using tools, we withdraw ourselves from the target - but being the target is exactly how to make deeper progress. On the other hand, representational approaches (attaching meaning-patterns to objects and then creating experiences involving the objects) can be fun and easy and does get to the heart of treating all experience as a dream environment, where anything can mean or do anything.

...

Good analysis - the problem of Second Cause in a nutshell. The confusion of association (linking of memories) with causation.

Yes, "being the target" isn't easy; even the phrase already implies a division. The only way that seem to work is to "stop generating". In other words, cease maintaining division. Even the direct approach of "becoming" requires that. Detachment and intention all over again.

That's how I interpret the situation.

A better interpretation is: there is no "way" to do this, so there's nothing for me to say. Whatever I might say, would be a description of a technique. There are no doors or way to make it easier, because it isn't hard or easy. In truth, I wrote everything I had to say about it around 7 months ago and 4 months later. Anything else is really just a reformulation into different language, the creation and application of different metaphors, which might generate fresh ideas for experiential direction, but none of which change the underlying message.

...Sorry, I got distracted by my own typing there: expand on that ignoring or running away from subjectivity? Something I've noticed repeatedly: being all too willing to be distracted from settling into that.

I knew that. I still think there are things to say.

Yeah, I agree that it's about removing obstructions. But how are they removed? By the same non-way approach of intention. There are always things to say, because the total pattern is always changing in terms of distribution, but there's nothing that can be said about intending and "the truth" except saying that it is not doing and not this or that. There are infinite ways to not-say-it though. :-)

Cheeky on the criticising=technique! ;-) Now, I don't say anything can't be done, but by that I mean that I don't believe there is anything that cannot be experienced, so I'm really talking about "the experience of doing". Which would be Second Cause again...

Do you figure your contemplation will change at some point?

Well, the underlying thing of it I don't see changing (which amounts to a not-this), but everything else will definitely right? And subjectivity is a good one: there's that whole thing of realising that for there to be a notion or experience of being subjective in one way, that's not being subjective in another way. If it is discerned at all, then there is somewhat of a division or contrast in experience. So yeah, you're spot on that the style of contemplation will change quite dramatically, because even to look at something is to have it shift by the looking. I think that just knowing this means it's more of an "exploring possible experience adventure" rather than an "uncovering of fundamental truth" though?

I don't care about a fundamental truth. Not anymore. I want a powerful and useful truth. Useful to me and powerful for me.

Right - and this speaks to your other comment too, which I found really evocative of a certain struggle that goes with this territory.

I suspect a lot of us (naturally) get into this looking for some ultimate knowledge, something that can be discovered and seen and used - a "thing". Then eventually, it a cliché, but we find that it was here along along and that, so obvious, it must be everything and everywhere already. As you seem to have, I spent a lot of time wrestling with should about "me" and tried to manipulate it into a certain way, relative to a world, to overcome boundaries and all that.

But then, if I instead view everything as "experiences", and that the experience of being me "comes-with" a world, I realise I don't need to worry about boundaries or separation. I view it that I am having the experience (taking on the shape) of being-a-person-in-a-world, and that "the world" is a state that includes all of this. Spontaneous body and thought experiences arise from and are part of the world, a continuous pattern, and reveal its present state. Intention-imagination is then the act of directly being and modifying the distribution of patterns that constitute that world. There's no room for "me" at all, in one sense; I don't need to worry about it.

No, the world isn't a ground of experience. By "world" remember that I don't mean a "spatially-extended place unfolding in time"; I mean something more like the current state or pattern of your present experience. To leave the world would be to allow those constituent patterns to fade, and others to become brighter and more dominant. Essentially, there is no world other than the experiencing of it (of course), but it's usually to have some way of referring to the present state.

There is no room for anything other than "me." What isn't my choice? I can't find it.

If it's all you or there's no you, it amounts to the same result. No division, no (apparent) existence.

Oh, I'm not claiming any definition is "the ground of experience". There is no "ground" except in the sense that experience is "made from" consciousness-that-is-me or whatever. I'm just suggesting that repartitioning our idea of person-and-world can be helpful. More later.

...Hmm, I was talking structure there, but yes the "fundamental" is will/being/potential and all that stuff - the attributes of a "something" that can become anything. Y'know, God. Yes, I'll sign your bible if you want.

The world is my Bible, Nefandi. I've noticed you reading it on a daily basis, which is great. Not that you have any choice of course. I'm here for all eternity, so do tell you your friends - thank you and good night! ;-)

...

AI: *In other words, cease maintaining division.*

I very much like this phrasing.

Edit: Jives with my model of experience that I base off of the Hindu trinity. All of experience is creation, maintenance and destruction (actually transformation). I find this to be a nifty way to view things. Creation can be seen as the intending, maintenance as the confidence or knowledge of one's intention as truth, and destruction as detachment or the act of experiencing truth.

Ah, interesting about the trinity. Particularly specifying "maintenance", which is usually hard to incorporate into a model. I've tried to push away from those divisions too by having all possible patterns pre-existing, and varying only in their levels of contribution - their "intensity". This means that creation, maintenance and destruction are just the experience of redistribution, and intending is the act of reshaping that distribution (by activating or "recalling" a particular pattern into prominence). It makes it clear to me that everything is a shifting of experience; nothing is made or destroyed; it's always transformation and transformation is actually mundane. But of course, it's yet another way of chopping up the same thing into different language!

Yes I can see that too, all being transformation. I find chopping it up to make it more digestible.

I think the benefit of the approach of this subreddit is, we can feel free to use whatever "chopping-up" feels appropriate at the time. Freed from concerns about being "right", we can adopt whatever view is the most useful for our purpose. Your trinity description has the definite benefit of being static - you can hold the concept in your mind and refer to it easily without having to "run" it mentally - whereas the shifting-transformations description is dynamic, so a bit slippery for everyday use maybe. (I'll be adding it to my armoury!)

TriumphantGeorge Compendium - Part 21

POST: A question about tables

I suppose we would have to start by tackling what we mean by "yourself", "outside" and "tables". Basically, we have to begin by discussing the nature of experiencing itself.

Eventually, we'd get to something like: what "you" are, is subjectivity; there is no outside to subjectivity; all possible forms can be thought of as being "dissolved" within subjectivity like patterns at different relative intensities of contribution; a perception of the table is the table, or rather a direct sensory aspect of it; there is no need for an independent "feed" and in fact this would be nonsensical; our subjectivity "takes on the shape of" states and experiences and is not separate from them. Furthermore, we would have to address the possibility that the world-as-it-is is not necessarily of the same "format" as sensory experience - in other words, it is not a "spatially-extended place unfolding in time". Spatial extension and context, and change, are aspects of experiences rather than aspects of the world as such. Only "experiencing" happens; the world does not "happen". And so on. There is no contradiction, I suggest.

The first two parts imply that our purely-subjective sense-inputs are...

In your reading of the first two statements, you have presumed such a thing as "sense inputs". The notion of "inputs" of course implies an external world - but that is begging the question. In your current experience of this moment, can you identify any "sensory inputs"?

The most consistent explanation would be that there is some external "it"... Though how exactly that happens is subjective, yes.

If there were an external "it" - what would it be external to? And could we ever ascertain whether something was being caused by an external "it" versus that something arising purely internally? Do we ever in fact experience anything external, other than as a thought about something being external (a thought which of course arises internally)?

An additional line of questioning would focus on what the "stuff" of the external would be made from. In order to interact with the internal, would it not have to be made of the same "stuff" as the internal?

I suggest that we aren't dealing with "sensory inputs" here; there is no "outside" to experiencing. I also suggest that it's vital that we note the difference between attending to our experience and thinking about our experience. It is very easy to build "castles in the sky" which are self-consistent and so "make sense" when we think of them, but in fact do not correspond to the structure of our ongoing moment as it is experienced. These "parallel constructions in thought" have an inherent problem: they arise within experience and so cannot capture experience. It's like trying to build a sandcastle which accurately models both "the whole beach" and also "sand". If one is not careful, one ends up making a partial duplicate of another sandcastle and calling it "the beach" or "sand", when it is neither (but also, somewhat ironically, both).

I think believing you are everything you experience is nonsensical.

It is not a belief. It is, finally, a direct observation, from which follows a self-consistent description. Whether that description seems nonsensical or not, depends on that platform from which you think about it. For starters, as I indicated in my first response, it matters somewhat what you consider to be "you". The thinking that occurs within one "castle" does not necessarily translate - often cannot be translated to - the thinking which occurs in another. They are, however, self-consistent within their own perspective. In the end, then, the reason to go for "B" is that direct observation does not in fact support "A". Never having observed an external world, and discovering no edges to one's experience, the only possible conclusion is that the world is entirely within experience, which is you, and is entirely made from experience, which is also you. A coherent description can then be built - in fact, many can be built - from that starting point, each with their benefits as relative truth, while only the observable nature of experiencing itself is held as the fundamental truth. [1]

Aside: There's not much point in quoting stretches of philosophical writings. What matters is how you are bringing their insights - or rather, your interpretation of their insights - to bear on the discussion you are having. I can copy-paste you a whole load of Kant if you like, but I don't see how that furthers a discussion?

[1] Please note that kicking a stone is no refutation.

Don't be silly.

That's not very helpful. My point was that just quoting doesn't engage the points raised, as they were raised and in the context they were raised. It's not a discussion. My "kicking a stone" comment was fairly obviously a gently playful allusion to that. No spaghetti monsters involved.

Subjective interpretation is indeed undeniable.

Do you not mean to say that subjective experience is undeniable?

What you are interpreting is most simply explained by the external.

I don't think it is. Now, you may have an "instinctual belief" in an external world, but many do not, after attending directly to their experience, and find reason to question it. And I don't agree that an "instinctual belief" in something is, of itself, any reason to refrain from exploring parallel constructions. No justification at all is required to do so, other than curiosity. Beyond that, the benefits of a parallel construction will likely only become apparent after it has been constructed.

"can never be any reason for rejecting one instinctive belief except that it clashes with others"

I would disagree. See above. There is no reason at all to commit to a single view - besides lack of interest or curiosity. In fact, the recognition of an instinctual belief may itself be the motivation for putting it aside and seeking alternatives. You realise it's just a "castle in the sky", suggesting there are other such "castles" to be constructed and explored. You seem to be implying that an alternative construction, based around a purely subjective view, could not allow for "a harmonious, complex system..."? Why do you think that? (Of course, a "purely subjective view" isn't a subjective view at all, since there is no subjective/objective dichotomy. There is just "the context of experience".)

POST: Lucid Dreaming Question Which Pertains To Reality

Basically, the only "correct" or fundamental truth is that "there is an experience that is being experienced" - made up from sensations, perceptions and thoughts (which are really of the same nature: "awareness"). This is the context of experience. Beyond that, all content of experience is relatively true only. There is no "how things really are" behind the scenes; there is no "how things work". In fact, there is no "behind the scenes". What there is, in effect, is experiential patterns within your subjective perspective. And since it is you-as-awareness that "takes on the shape of" these patterns, then by shifting your own shape you shift the formatting of your experience. So that's probably the two main truths, really the only ones and the same one actually:

- The "nature of experiencing", which corresponds to the true nature of "you" - context;
- The implications of this for the structuring of your experience, and how it can be re-patterned or reformatted - content.

If we conceive of the latter as amounting to a set of "facts" corresponding to the sum of all intentions so far (and their implications), then we have a better idea of how to think about "lucid dreaming" and "how it operates".

POST: How to start? Or maybe not.

Oneirosophy is less of a concrete path and more a topic of study.

Quite so. And as you point out, the reading list is intended to raise questions - it simply points out possible texts for contemplation across a range of areas - rather than provide answers.

...just an inability to read the sidebar/faq is all.

As more and more people use the Reddit app, the tendency of people not to read the sidebar - or even know that there is such a thing as a sidebar - is becoming a problem for more nuanced subreddits everywhere, I think. It's not necessarily the user's fault; the app is just a bit of a crap design generally. One approach is to make a sticky which contains the text of the sidebar. Provided users don't have their app settings sorting things by "hot", then at least the introduction will be the first post on the front page. Would take two seconds to do that - shall we?

POST: Clarifying a few things. (By cosmicprankster420)

[POST]

Alright so some readers here are still not fully clear on what the idea of Oneirosophy is, and maybe there are a few things i didn't explain. A few people mentioned how they don't understand how it is more than just lucid dreaming or feeling like this is a lucid dream. The importance of this feeling of lucidity is recognizing that this very well may be a dream right now (I believe that, but i'll let you decide for yourself) and that if this is a dream then it can most definitely be changed with magic. In HP lovecrafts short story Celephais there is a part in the story when Kuranos is exploring the dream lands that he comes to a place outside of what he calls infinity inhabited by intelligent glowing colored gases that study the secrets of existence. This is the kind of place Oneirosophy takes you in that realizing the dream like nature of existence you are in fact stepping outside of conventional reality into a place where the talking purple gas clouds live. The reason it is a practice is because although one can claim to be a subjective idealist on an intellectual level they may still have materialist habits and thought patterns at the unconscious level. By blurring the line between waking and dreaming and achieving lucidity this mindset becomes integrated at a more fundamental level emotionally and experientially rather than just conceptually. When this is integrated successfully there is a feeling of peace as well as a sense of courage to do things one was normally afraid of doing. And like Nefandi said somewhere its not just about making the dream world seem real but making the real world seem more dream like.

[END OF POST]

This is good. Yes, the point is to **recognise that this actually is a dream**. And not just to think it or recognise it intellectually, but to feel the truth of this in your moment to moment experience.

And (magickally speaking) what could be more flexible than a dream?

POST: Proposal for terms?

Since part of the point of this subreddit will be (I'm assuming) to mess with concepts, break them and find new ways of saying things as required, it might be better to just let things flow freely.

POST: Dreams - what are they good for?

This is not a sub for philosophy!

Except perhaps for what we might call "practical philosophy", since we'll be using and pushing idealism to its limits, i assume...

POST: Resignation

I feel that this was going to happen eventually; it wasn't something that could have been resolved by discussion, and it wasn't really anyone's fault. How do you agree or compromise on fundamental matters of style, with a subject which demands you speak from your identity? Some styles are mutually exclusive, and it's difficult to host both in a single forum, in terms of moderation or amongst subscribers. So in some ways, although it's obviously somewhat bumpy as transitions go, this is actually probably the most efficient way for it to get sorted. The challenge going forward is that this subreddit and whatever else emerges from these events must clearly set out their stalls in terms of "mode". Although "nice" isn't always necessarily the best way to grow, it is "nice" to have the choice to select the style that works for you in any moment - and maybe that's what will come out of this: an opportunity for people to pursue their chosen way without compromise.

Personally, I'm about the ideas whatever context they might be embedded in, and I'm good with whatever communication style does the job at that time. Not so much on the fence, as playing sport badly in the fields either side of the fence simultaneously...

POST: An Outside Observation

It turns out that the moderators were having a "people-shaped" experience - who knew, eh? Anyway, when two or more directions arise in direct conflict, like with tectonic plates, a shake-up is probably inevitable. And perhaps the use of anger is that is sometimes the most efficient way for a change to happen in strained circumstances.

Non-duality doesn't necessarily correspond to "everyone being nice to each other all the time", even though it's my own preferred approach; non-duality is impersonal. Events arise, this includes apparent interactions between people, sometimes those interactions corresponds to an angry narrative, then that part of the story completes. Regardless of the manner of its occurrence, the right thing has happened overall. And now, we have a subreddit for one flavour of this topic - a looser forum to explore the perspective "life is dreamlike in nature" - and there will be another for more hard-nosed philosophical discussions of subjective idealism. The right thing doing itself, for everyone. I wasn't speaking in support of how things played out really - "my preferences lie elsewhere", you might say - and I do get the point you are trying to make overall (why are people shouting into the mirror?). However, it's kind of done now, and the final result is probably the best outcome (in my personal view of course) that doesn't mainly involve, as of this moment, just wishing that situations and people/aspects were different than they are.

"A thing", indeed. :-)

Thank you kindly.

If something good has come of this, beyond the overdue bifurcation, it's that lots of people have piped up to explicitly say that they care about the subreddit and the topic it explores. This bodes well for the future!

POST: [META] People should look into a few things before they post

[POST]

- Cognitive Dissonance
- Baader Meinhof Phenomenon
- Schizophrenia, psychosis other hallucinatory illnesses
- Depersonalization
- Sleep Paralysis
- Fugu State
- Absence seizure

Way too many people post things with a whole thought of "Lel I shifted realities" before checking out what it really could be. I'm all for mysteries and shit but some things can easily be explained by things mentioned above. If anyone knows any more just post it below.

[END OF POST]

Good list, although: The point surely would be that if people read a post and think one of those is the explanation, they can then post a comment describing how, exactly it accounts for it. So long as a post is "an everyday-mode experience that OP is confused by and has no explanation for", it's valid. OP can then choose among submitter contributions. A key problem is that glitches (as defined in this subreddit) are usually one-off experiences that can't be repeated - hence not scientifically studied. We are then left with personal opinion - what one deems to be "likely" or "plausible" given their own life experiences to date. In other words, if we can't test a theory, then it stays a theory.

Short version: Certainly take these things on board, but don't be dissuaded from posting your experiences. Simply naming or categorising something is not the same as having explained it; and it certainly ain't science.

And it's okay sometimes to just not know.

What if the answer is something mundane that we don't know?

Exactly. The real answer to most glitch reports is: you'll never know, but pondering it might turn up some interesting lines of thought. The discovery is in the discussion. However, there's a real urge "we" have to choose an option from the available ones, to wrap things up and "be right" or at least resolved, even when none of them are much good as an explanation. Why do we feel so uncomfortable with that? Is it because we don't like acknowledging we know very little of our world? Not in some mystical way; I mean simple things like not understanding basics of visual perception. That uncertainty = instability, vulnerability?

But still I say, when it comes to choosing between crap explanations: "why not none?"

The problem with a lot of this stuff is that we don't have the equivalent of a "theory of gravity" for, say, memory. Fundamentally, we don't know what memory is (the sense in which it exists, where it is stored, how it is experienced). So we can identify similarities with other reported experiences (psychological studies, brain damage studies), but that is comparison and not explanation in a deeper sense. When we make progress along those lines, we'll get our mundane explanations. (Although I'm sure there will be radical leaps in understanding to get to the mundanity.)

Not remembering how many chicken nuggets you ate is not a comment on our understanding of memory. It is a person grasping for a reason to feel important, for a reason to believe they are one of the privileged few to peek behind this "curtain".

That's... a bit of a straw man, isn't it? (EDIT: Ah, that other comment.)

Well, I suppose a desire to experience something of importance is better than having a mission to stay committed to unimportance! But I don't see that's what's happening. Mostly, people aren't very happy at all when something odd happens to them; they find it disturbing.

A desire to feel important is good, but it can't be a delusion ("It is far better to grasp the universe as it really is than to persist in delusion, however satisfying and reassuring"). To think these things are sincere occurrences of a rift in space or time is delusional. To think you are important because you noticed them is satisfying and reassuring. We should want, as people, to be satisfied under true and honest circumstances. They might find it disturbing, but they seem pleased enough with it to post it to reddit. This community is fervent enough about believing it that they will downvote me for thinking it's silly and speaking out calmly about it.

I think they are downvoting you because you are responding to my comments as if I was saying something I'm not. In other words, you are replying as if I am promoting one view or the other - when I'm saying that the judgement should be on whether an explanation is well-constructed or not. Entertaining different views is not delusional; dogged commitment to a view in spite of shaky foundations, probably is. I don't think "this community" is a bunch of fervent believers at all. In fact, compared with other subreddits which highlight unusual experiences, it is pretty balanced. Most subscribers don't seem to have an opinion one way or the other; they just find it interesting to read and think about these things.

...

Q2: I say this from an educated in the sciences background. What if what science/modern medicine names as pathology because it is rooted in the belief that physicality is all there is, is actually glimpses into other dimensions and other cultures would call it a talent? I think there is room for that in this sub.

Q3: Yeah no, these pathology can be measured, diagnosed and treated, they have nothing to do with dimensionnal jumping and such.

Hmm. While I don't endorse "parallel dimensions!" as the answer to everything (or indeed anything), nor am I very impressed by the approach to "measuring, diagnosing and treating" many of what we call psychological illnesses. Perhaps it's because I studied physics, but when I look at the actual models being used, I see the very worst examples of "vague ideas someone had once" that become self-fulfilling diagnostics - lots of begging the question, no actual deeper theory that has or can be tested. In short: not science. In other cultures, many of these symptoms would have been viewed quite differently (I don't just mean primitive tribal cultures here) - however, our current society has little time to give, and the priority is on keeping people "productive", or at least reducing the inconvenience they cause. The aim is efficient bypass or overpass, rather than compassion and comprehension leading to solutions.

The experiences are real experiences, but the nature of them (and therefore the appropriate response) seems open to question - which is why it's fun to discuss them on this subreddit!

...

A1: YOU have schizophrenia! and YOU have schizophrenia! EVERYONE has schizophrenia!

Schizophrenia! It's the new absence seizure!™

POST: Lots of snide self righteous comments

We discussed this recently in the comments of this post [POST: [META] People should look into a few things before they post]. Mostly it's just an internet conversation thing, mixed in with a misunderstanding of what it means to be level-headed or scientific. It's not that commenters should believe, disbelieve or neither - it's that if you are going to comment, then you should be contributing to the discussion. And the point of joining the discussion here is to explore the topic raised by the post. Skepticism has become a

misused word. It does not mean that you remain attached (often emotionally so) to the currently dominant worldview, defending it until you are forced by "extraordinary evidence" to reconsider (this is what the behaviour of many would lead you to think). It means you are a curious and questioning individual:

Skepticism or scepticism (see spelling differences) is generally any questioning attitude towards unempirical knowledge or opinions/beliefs stated as facts, or doubt regarding claims that are taken for granted elsewhere.
-- Skepticism, Wikipedia

A true skeptic would treat observation (direct experience) as primary, and be wary of the reification of any explanation, including the current dominant one. He would be equally suspicious of jumps towards any single-phrase explanations - "brain seizure", "schizophrenia" and "parallel universes" alike. His question would always be: how, exactly does that description account for this report.

My own guidelines are: experiences are real experiences; explanations are useful narratives. We must be careful not to treat the concepts we invent as actual things, even when they seem to work really well. Our observations are what define our stories, our stories don't define what it is possible to observe. That's why we should welcome different ideas, because fragments of them might be useful later on.

Note: welcome the ideas, not believe them.

POST: [META] Possible explanation for some doubles/dopplegangers

[POST]

Subject line should start with [THEORY] instead of [META]. Sorry.
For many years, I worked security, usually on the technical side. If your keyless entry card stopped working, I was the one you went to for help. Imagine the following...
"I'm Betty Brown. My card won't let me into [location] anymore."
"Sorry to hear that. Let me look you up in the computer." Clickety. "Hmm. I can't find you. Let me see your card. I can look you up by ID number. Ah, here you are. Wait a minute! This card is for Rebecca Jones!"
"Oh, that's me."
"You just said your name was Betty Brown. Why is your name different on your ID card?"
Rolls eyes. "When I went to nursing school, I went by Rebecca, and I was still married to [first husband] so I had his last name. All my professional certifications are under Rebecca Jones. But my friends here at [this hospital] shortened my name to Becky, then it kinda evolved into Betty, and now I'm married to [second husband] so I'm using his last name, Brown."
"Okay, let's just double check that with HR." Checks out. "Okay, let's just call your department head and see where you need access." Dial, dial. "Yeah, what area does Betty Brown need access to?"
"Who?"
"Betty Brown AKA Rebecca Jones. Registered nurse, works on 4th floor, [physical description]?"
"Oh, you mean Ann Smith. She needs access to [location] and [other location]." Click.
"Why does your department head call you Ann Smith?"
Rolls eyes. "We went to high school together. Back then, I was using my middle name, and my maiden name..."
I had some variation of that conversation about once a month for 20 years. Several times, I'd be talking to coworkers about one security problem or another, and we'd realize that we were talking about the same woman using different names. Or to find that three or four of us had written incident reports about the same woman, all using different names.
On a related note, I was once speaking to a woman when a man walked up.
"Ann, is that you?"
"Sorry, are you talking to me?"
"Yeah. You're Ann, right? We go to [church] together."
"Sorry, you must be mistaken. I'm Betty. I don't go to that church."
"Oh, I thought for sure you were Ann. Sorry for bothering you." Man leaves.
"I'm glad he left. I didn't want to talk to him today."
"What? You knew him after all?"
"Of course. We've been going to the same church for years. I just didn't want to talk to him right now. I'm sure if it's important, he'll tell me Sunday."
"So, you acted like you didn't know him?"
"Well, I didn't want to hurt his feelings."
"Let me get this straight. You pretend to be a different person sometimes just so you don't have to talk to people?"
"Sure. Doesn't everybody?"
In the words of my favorite old boss, "I don't like people anymore..."

[END OF POST]

"Sure. Doesn't everybody?"

It's surprising what some people think is normal, and they've never been called out on. It would make a good AskReddit thread, except of course they are unaware of their own behaviour, so it would be empty.

Q1: The crazy (ha ha) thing is that I worked in hospitals for nearly 20 years, often dealing with patients with mental health issues. 99% of them realize they have mental health issues, freely admit it, and actively seek help. In spite of their issues, they are as a whole very nice people who generally act and sound normal outside of their one or two specific issues. The mental health professionals on the other hand are the weirdest bunch of jackholes I've ever had the misfortune of dealing with. You know how you hear that every medical doctor became a doctor because they were very sick as a child or someone close to them died? That goes double for mental health workers. But every one of them I know, no matter how strangely they act or sound, will insist they are perfectly normal. I think I remember that the woman in the second story was a mental health worker. I know she was employed at the hospital in some kind of authority role.

Heh, yeah. I've always been interested in psychology and the mind and so on, and one of the things that comes up is, often the reason people become therapists is because "to explore and heal the client's problems is to explore and heal your own". You never really have access to the client's mind; what you are dealing with is your own fabrication, an "inner client" you are imagining - i.e. an aspect of yourself. It's not the client who projects, it's the therapist, and the client becomes the therapist's way of working through their own issues.

Q1: On the one hand, I kind of think it's a good thing that mental health professionals have a background of mental health issues (either their own or a loved one) as it obviously makes it easier to understand where their patients are coming from. On the other hand, back in school we had a joke that one of our teachers wasn't really a teacher. He was just a really big dumb kid who had never been able to quite pass 4th grade, being held back year after year, until eventually he was an adult and just kind of took over the class. I sometimes see therapists not as highly trained and schooled professionals, but as therapy patients who attended therapy so long that they know all the answers and somehow got put in charge. In the movie What About Bob? Bill Murray's character, a mental patient, corrects a doctor's diagnosis of another patient and suggests a different drug therapy. The doctor agrees and changes the drug he was going to prescribe. I worked at hospitals for nearly 20 years and I can honestly tell you this actually happens.

Ha, I love your teacher example. Your larger point is accurate too. Sometimes professionals are too busy "being professional" in order to be actually good. It's often not their fault; the environment they end up working in does it to them. There is a general trend towards abstracted careerism, a sort of "meta" approach to what you do (see particularly: career politicians). Whenever the job involves a subjective experience and an empathy aspect, this has a particularly dire impact. I have family members who work in health and mental health, and encountering some of the (genuinely nice) people who work in that industry, I am often shocked at how there are very basic things they

have given no thought to. There's a trend towards "solutionism" without having an underlying model - a lot of it seems to work on ideas on the level of "gee-whiz" popular science magazine articles, or in response to current marketing. It was always thus, but the increased focus on "being a successful business" rather than "succeeding at your purpose" has made it far worse than ever before. Meaning: politics aplenty!

And what is a career politician, if not a skilled gaslighter who can change his or her view on a whim? A multi-opinioned doppelganger of themselves! (Had to loop it around somehow.)

POST: [META] Try it at home! See the matrix in a laser cat toy.

The speckle pattern? Not a glitch as such, but interesting to ponder because it encourages us to revisit assumptions we might have about our experience. From that Wikipedia entry:

[QUOTE]

A speckle pattern is an intensity pattern produced by the mutual interference of a set of wavefronts.[1] This phenomenon has been investigated by scientists since the time of Newton, but speckles have come into prominence since the invention of the laser and have now found a variety of applications. Speckle patterns typically occur in diffuse reflections of monochromatic light such as laser light. Such reflections may occur on materials such as paper, white paint, rough surfaces, or in media with a large number of scattering particles in space, such as airborne dust or in cloudy liquids.

[END OF QUOTE]

There's a nice little summary which corresponds to your own experimentation somewhat, here. Excerpt:

[QUOTE]

1. The speckle is not on the surface you are viewing. To prove this, hold a pencil at your near point and focus on it while gazing at the screen. The speckle pattern is still sharp! If you wear glasses, take them off: no difference. Speckle is an interference pattern in space caused by the coherent light of the laser being reflected from the rough surface.
2. Because the speckle pattern is not located on any particular plane in space, you will have trouble focussing on a laser-illuminated surface; the eye involuntarily tries to focus on the speckle grains. Try reading a printed page by laser light. Try again while moving your head.
3. The apparent "grain size" of the speckle depends upon your distance from the viewing screen and also the aperture available to your eye. For example, if you hold a variable iris in front of your eye, closing the aperture will increase the coarseness of the speckle pattern; the same thing happens if you step further away from the screen.
4. The speckle pattern is sharp regardless of your visual acuity. In fact, you can use speckle as a crude eye test: stand about 2m from the illuminated surface, and move your head slowly from side to side. If the speckle pattern appears to move in the same sense as your head motion (i.e., pattern moves left as your head moves left), you are far-sighted. If motion is in the opposite sense, you are nearsighted. If there is no motion of the pattern, you have normal, 20/20 vision. If you wear glasses, try this test with and without your glasses; if you have normal vision, simulate nearsightedness and farsightedness by holding positive and negative lenses in front of your eye.
5. Speckle is observed only for stationary surfaces. For example, your hand will not display clear speckle, nor will the surface of a glass of milk (use the milk surface, not the glass) -- milk is a colloidal suspension and the Brownian motion of the suspended particles destroys the pattern. This fact can be exploited to detect vibrational motions with amplitude as small as a quarter-wavelength (about 0.15 micron) with the unaided eye.

So, your final idea that the pattern is "in the universe" is not a bad one - although I would probably phrase it as the pattern being "distributed throughout space" or something like that.

My crush doesn't exist.....

[POST]

So I there was this girl I worked with that I liked.... I actually created this account 5 months ago and posted on /r/dating_advice looking for help. I had finally gotten the courage to ask her out yesterday. She was supposed to be at work, but I didn't see her... I looked at the day-schedule and didn't see her name on there. When I asked my boss (who knew I liked her) where she was, He asked me who I was talking about. So she no longer exists. I tried to find my other posts, but this reddit account didn't exist, so I had to re-make it. I know she was real. There were so many interactions I can remember. The feelings were real... HELP!

[END OF POST]

Consciousness can easily be described by physical laws we know about.

Actually, really? How exactly? Because you should write that up if you know, and save neuroscientists like Christof Koch resorting to panpsychism and cognitive scientists like Donald Hoffman proposing reverse interface models!

Perhaps you are referring to the hope that somehow, one day, we'll be able to describe how consciousness arises as an "emergent property" of brain chemistry - but the fact is that not only do we lack a theory of consciousness that could lead to this, we do not even know what form such a theory could take. Alternatively, you might be referring to a correlation between brain patterns and reported experience, but that is the problem of content not consciousness - i.e. the soft problem vs the hard problem. Most solutions being proposed currently involve some sort of flipping round of consciousness in the hierarchy of structure - in other words, making it at the very least a more fundamental property, and in some cases the fundamental property. (Note: this doesn't mean "self conscious intelligence", it means "the property of awareness".)

Apologies for the rant, but this is an area which is fundamental to perception and to science generally, and it's always a shame to see something so important dismissed with a couple of ill-informed one-liners, especially ones based on such simplistic metaphors...

Q1: Thank you for that. I know that some level of skepticism is certainly healthy no matter what arena of life we're talking about, but this is one subject area where I find that people tend to have an infuriatingly common kneejerk reaction to any suggestion of intelligent discussion or philosophy. I find it confounding that so many people are so rooted in the presumption that the consciousness is derivative and not originative when all existing scientific evidence seems to suggest the latter.

I think the strange, almost-emotional reaction stems from where they subconsciously (haha) fear this would lead: that if "everything is made from consciousness" then there is no solid substrate behind reality (true) and anything could happen (yeah, well). Nothing would be "real", life would have no meaning, the world would be in chaos!

But if it is true now, then it has always been true, so nothing changes in the knowing of it, except perhaps a greater sense of interconnection. Our understanding of the nature of our experience changes, but the actual content does not. And one has to ask: in what way is a description based on "dead" atoms interacting deterministically particularly meaningful in comparison?

Or perhaps the fear is more fundamental even than that. Perhaps it is that it would force us to recognise that the only thing that ever "happens" is our observations, and absolutely everything beyond this - our "explanations" - are merely connective fictions that have no reality other than our thinking of them. It's unusual for a discussion on this topic to get that far though...

...

Q2: She still exists, just not in your perception. From what I've experienced and read it's not that hard to get a person out of your perception, because there can easily be a coherent story (hit by a bus, heartattack, move to another country). Thing is, in our world view there is no coherent explanation of someone coming back into our perception (except someone just moved to another country), so this one is not an easy case.
edit: mh but now that you experienced that people can simply vanish, a step in the right direction could be to truly accept that people can simply appear too

Q3: Or he's mentally ill

Or "worse".

Q4: worse being...?

Exactly.

[META] Has anyone else noticed that we never actually SEE anything disappear?

Q1: I saw an article a while ago that talked about how the eye won't notice some sudden changes. There were pictures in which a part of the picture would disappear, then reappear a while later, and you wouldn't even notice. Things like a plane's wing would vanish while I stared at the picture trying to figure out what changed. Perhaps we witness the disappearing, but don't SEE it.

Yes, this is how I think it happens. Unless we are looking specifically for that object. For instance, if you had been looking for the wings you would notice they had gone. Everything is running on permanent "autocomplete"; attention does the detailing.

Q2: I recently had a physical and neurological check at a hospital, because I often see, well to best describe it, blue squares in the corner of my field of view (they disappear when I try to directly look at them) they said I'm one of the healthiest persons they ever tested, so I was a bit clueless till now, do you know how I get rid of this?...

Q2:...the color is not as solid as on the picture, it's shiny and almost glares

I don't specifically, unfortunately. But... a couple of things, though: do you wear glasses or contacts and/or do you have a tendency to stare when looking at things? (The reason I ask is related to an idea about shifting you attention, which can be quite helpful with perception in general.)

Q2: Yes I wear contacts and it mostly happens while I'm staring at something, for example when looking at my computer screen or out of the window (sorry if my english isn't good right now, I already had some prosecco)

(I'm on beer, which always makes for maximum eloquence, or so it seems to me, as the evening progresses. Hmm. So you'll excuse any meandering.)

Okay, well my vague suggestion is that you are "fixing" your vision by staring, and that causes the blue squares. Basically, it's your mind's best pattern-matching interpretation of areas in your perceptual field which haven't been "updated" because your eyes aren't moving freely, perhaps coupled with pressure you're creating by staring. So, I'm gonna give you my top visual perception tip, which others have found useful. See if it helps. The main thing to realise is that you are not meant to actually see! By which I mean, you are not meant to be "using" your eyes. Your whole perceptual system is automatic: information enters your mind, is clumped up into objects and locations, all spontaneously. Any effort to "make seeing happen" actually interferes with that.

The essence of it:

- You want to "let the world come to you" rather than trying to grasp it with your attention.

Okay, but how to do this practically speaking? I suggest you take a moment to notice "the place you are looking out from". Do you feel that you are "located" right behind your eyes? Do you feel that you are trying to "narrow" onto them in order to see? Probably the answer is yes. Instead, try this:

- "Sit back" mentally in your head, about halfway back, to somewhere at about the centre line of your body. "Look out from" that location instead. Rather than reaching out, sit back and just let vision arise within your perceptual space. You will probably feel your eyes and face relax a little.
- Now, experiment with changing your position along this imaginary vertical line running through the centre of your body. You can even "look out from" your chest or your abdomen. Find the vertical position on the line where you feel most "at home".

So, hopefully that helps in some way.

Why does this work? Because you don't see with your eyes as such - rather, you are perceiving the result of seeing with and within your mind's "perceptual space". A lot of vision problems can, I believe, be caused by unintentionally "deforming" this perceptual space by poor use of attention, which in turn leads to more tension in an attempt to compensate, and so on in a downward spiral.

TL;DR: Sit back in your head, allow the world to come to you.

This would also imply that everything is void, while I'm not looking at it, scary

Well, it's the first inkling of a larger understanding I suppose, but you don't really need to worry about that...

The way to look at it, I suggest, is that focusing our attention is the opposite of what we think it is. We tend to assume that focusing our attention ("concentrating") is how we should go about seeing things, but actually that is how we narrow onto things and block other stuff out. This is a bad idea!

In other words, the reason you get voids in the first place is because you are unwittingly excluding information by narrowing your attention on a small part of the world. What you should actually do is leave attention alone, let it open out and shift as it needs to according to what you are doing. We should live our lives by directing intention (deciding what we want to happen and letting our nervous systems move towards that spontaneously) rather than controlling attention (gripping onto our nervous systems and interfering with their natural movement). Otherwise we're doing the equivalent of commanding ourselves to move whilst determinedly staying still. So if you are, say, reading through your messages - like this one - rather than focusing on the "how" by controlling your eyes, instead sit back mentally and "just decide" to read them. Sit back and let your body and mind take care of the details. You will find that they move appropriately by themselves, if you don't interfere.

This is the "secret" behind improved eyesight (really: perception) and also effortless body movement (really: shifting state). It's not really a secret though because it doesn't involve a technique; it just about not doing something that gets in the way of what's happening anyway. Fun to play experiment with, and lots of potential for making the moments of everyday life more enjoyable.

Q2: Sorry for the late reply, went on holiday. I now use this always in everyday life and I guess I experienced a "glitch" because of it too. I dropped a glass and fetched it with some kind of lightning fast reflex, it was impossible to catch it the normal way, but when I asked a friend of mine who witnessed this, if she had seen how abnormally fast I fetched the glass she stated that there was nothing unusual about how I fetched it. Why did she witness a normal body movement? From my view it was discontinous (like minimal teleportation)

effortless body movement (really: shifting state)

So now that I've read through your comment again, I can comprehend what you meant, which leads me to:

We should live our lives by directing intention (deciding what we want to happen and letting our nervous systems move towards that spontaneously)

When you wrote about this, I didn't realise that it also seems to allow things to happen that aren't usually possible, but now that I'm a bit acclimatised I'm curious and will watch now more closely in my everyday life, anyway thanks for sharing your knowledge.

Thanks for dropping me a note (and not that glass!).

Well, you'll find that everything becomes the most efficient it can be - sometimes "more" than that - but you'll also start to realise that people don't really perceive things properly (they don't tend to notice the unusual) - just like you didn't used to, until now. Anyway, happy I could help.

...

Q3: I don't think I've ever mentioned this to anyone, but when I was 5 or so, I had a small plush Ernie doll from Sesame Street. I vividly remember being in the kitchen and laying the Ernie doll on the breakfast table and POOF, the hair disappeared right in front of me. I don't exactly remember if I had looked away, but it was shocking. I loudly protested to my mother, who would have none of it and told me I was imagining things. I still have no idea what the hell actually happened there. I assume I was somehow hallucinating, maybe I had a fever.

Q4: There's actually an explanation for that; You were very used to the Ernie doll having hair, and it was removed for some reason (through rough play, cut off because of gum being tangled in it, pulled off in the dryer, etc.) And prior to that instant, you hadn't noticed it was gone and your mind assumed it was still there, and then when you finally did notice it was gone, your brain 'corrected' what you were seeing, causing it to 'vanish'. This effect is more common in adults because we have more knowledge and experience and fill in more of what we see with symbolic placeholders for what we expect to be there, while kids tend to see things without the symbolic filtering, but it can happen to kids as well because of their narrow focus of attention (i.e. they tend not to notice things a lot.) This effect is usually associated with a 'sinking' or 'lurching' feeling or a sudden feeling of 'wrongness' that can be quite upsetting, even to adults. Another great example of this is a misspelling on a street sign. You might walk past the sign for decades and always read it 'correctly'. Then one day as you're walking by, you get a feeling of 'wrongness' about the sign and a sinking feeling in your stomach, so you stare at the sign trying to figure out what is wrong with it until finally the letters appear to shift and move, revealing the misspelling as your brain rebuilds the visual symbolism of the sign to incorporate the new information (the misspelling) and 'correct' the image.

Right, variations of this come up a lot, although we rarely give it much attention unless the circumstances are unusual:

"When I got in the darkroom, I realized that I could very faintly see the big table in the middle of the room with all its individual tubs of developer, stop, and fixer. This disturbed me, since a darkroom is supposed to be absolutely dark. I reached for the corner of the table, and when my hand reached it, there was nothing there. The table immediately vanished from my sight. I fumbled around a bit, found the table by feel, and instantly it popped back into view in a new, and "correct" location."
-- Darkroom Vision & Chef Hats & Dreams

...Did the hair stay disappeared?

Yes, Ernie was forever bald after that.

Poor Ernie! But perhaps it was Bert's revenge.

POST: (META) The Physics of Information and Unknown Unknowns

[POST]

Eric Wargo expands upon Jacques Vallee's proposition that in order to understand the science behind the occurrence of mysterious events, we first need to develop a language for the physics of information. It's a very long read, but some here may enjoy it. (and yes, there are some interesting glitches contained therein)

[<http://thenightshirt.com/?p=3060>]

[END OF POST]

From the article:

If there is no time dimension as we usually assume there is, we may be traversing events by association.

Uncanny, I've been playing with just that idea lately. What we call "the world" is our subjective view of a particular strand of associative thought, albeit a bright and immersive one. The "physics of information" proposed sound a lot like Kant's noumenal - which I think of as a collection of dimensionless "facts" which are basically your observations-so-far, dissolved into the background of subjective experience. The point: all facts about the world are either here and now, or will appear on-demand when observed as if they were here and now.

Q1: Yes, our ingrained belief in absolute, observable and linear causality may hinder our understanding of what is really happening. For example, 'forward memories' might explain a lot of glitchy events. Take the story of the broken plate that's up today. When the Redditor broke a plate, it seemed to be the second one, because the person had a double awareness of it happening. There was the actual event, and the memory of the event, an associative forward memory that the mind could only handle by slotting into a past time line. Or not. But as a theory goes, it is as possible as apportioning plates!

Or it could be even simpler! Imagine that what we call reality is really a super-basic experience with no depth. When I say the world is a strand of thought - that we are thinking *about* a world - let's take it literally. In a certain defocussed state, random thinking might get blended with the world-thought and be incorporated into it.

Thought Experiment:

You draw a picture of an owl on your TV screen. It is always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now instead imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

EDIT: Actually this was part of the original thread I'd linked to anyway! Oh well, it's so good I've pasted twice! ;-)

Q1: This kind of 'summoning' is great for thrift shopping, when you know what you want. But I think it can also be good to approach it in the reverse way...if you start to see a lot of owls...ask to understand the 'message.' Why were you drawing owls on your holographic screen to begin with?

Yes good, the world you see around you is your current state!

Because it is the extended pattern of "owl" that is triggered, then your experience might be "hey, why am I seeing loads of things about eyes, beaks, feathers?" and you eventually infer "owl". Perhaps you encounter lots of TV shows, films, news articles about duels and wrestling sports and so on, overhear conversations about competitions, keep coming across literal forks in the road that you don't remember being there before. You eventually infer "my wife and I are at odds about a certain issue, a choice to be made, and I've been ignoring it". All patterns are of-a-single-piece. And so on.

...

Q2: The concept of psychokinesis doesn't follow the concept of thermodynamics whatsoever, so it's kinda BS.

Q1: I'm sorry, a lot has happened here in the last few hours, and I'm writing in a hurry, but I'll have to reread it the article to see what claims were made about psychokinesis in regard to the physics of information. If there was a claim that it follows the concept of thermodynamics, I missed it.

Q2: Well, it simply acknowledged that psychokinesis is a believable concept, implying that the author doesn't understand how energy works.

Hmm, and how does energy "work"? ;-)

Not to back up the article necessarily, but it seems to be suggesting 'energy' (it uses quotes) in the sense of non-local information transfer. Something like Bohmian mechanics does permit non-locality, and some of his stuff is becoming popular again. (EDIT: This paper is worth a read as regards energy, thermodynamics, and information.)

Of course, having a theory or not doesn't prove or disprove anything - if someone makes actual observations, then that's that. As far as I know, there are quite a few studies showing beyond-chance influence over random processes, but nothing dramatic like levitating chairs and so on! There's some coverage at the Cavendish Laboratory in Cambridge and work at Edinburgh University.

TL;DR: Undergrad physics can give us the illusion of certainty in a world of ambiguity. Maybe it's more about informational patterns than quantities and fixed relationships/laws?

So if you do predict something, and get it correct above the expected number of correct guesses, it doesn't really mean anything.

Um, you should maybe "just read up on this" some more. Plenty of papers out there proving some small effect. The nature of the effect is something else of course. Princeton's PEAR not a bad place to start. Individual experiments often show something like the decline effect, though, which is interesting in itself.

Also, why did you bring up undergrad physics?

I just got that vibe - someone who has the certainty, but not the knowledge or larger context. I was the same. Things are more subtle and less definite than one might assume; models aren't truth, they are simply efficient fictions with predictive power. Just reading beyond textbooks and popular science quickly puts things in perspective, whether that's Schrodinger's lectures or George Ellis, etc (more recently here [<https://www.nature.com/articles/516321a>]).

EDIT: My own view is that unless we study some philosophy of science - I like a bit of Paul Feyerabend - and have some familiarity with the reasoning behind idealism and materialism (nice bit of Berkeley or whatever), then we don't really know what "doing science" actually is, and are in danger of fooling ourselves.

Can you make a post about this on /r/physics?
I'd like to get a larger group of people on this.

We could but, what about exactly? There are experimental observations of an effect but no satisfactory theory to discuss (as far as I am concerned).

And that's because we have no sensible account of consciousness yet ("emergence" being a non-explanation), which is of course vital in this. That would, in some sense, be the "cause". There are things like Integrated Information Theory and Hoffman's Conscious Realism which attempt to relate consciousness to the underlying nature of the world, but then we're talking metaphysics rather than physics. We're hitting the observer boundary. We're at "the thing before" an experimental observation takes place. From an experimental point of view, all that happens is (say) the ball bearings have a distribution which deviates from chance in the predetermined direction. There is no apparent mechanism.

EDIT: Ah, or did you mean something on "how we should view physics"?

This is kinda out of my range of knowledge.

It's the "mystery zone", everyone's in the same boat to some extent, from this point!

Some thoughts to agree or disagree with:

Science is, I suggest, an approach in which we conceptualise the world as being made up of "parts" and then try to link those parts back together again via useful stories.

How do we do this?

By noticing repeating regularities in our observations. We then create explanatory fictions which can describe those regularities and anticipate what will happen when the same circumstances arise again - by taking the "parts" and inventing additional concepts to act as glue. But this leads to an important couple of points:

- We (can) only do this process for observations which are obviously "part-based" and whose patterns can easily be identified and deliberately repeated.
- This is equivalent to only recognising objects that there are words for. In fact, it's more like only recognising objects for which there are words for, and which rhyme with one another.
- The models we create are fictions. Their power is in their applicability and reuse, not in their correspondence to a deeper reality. (We must therefore be careful when we say that energy, mass, fields and so on "exist" independent of this context.)
- This is why we have to be careful when we use our models as the basis of declaring something possible or impossible, outside of their applicable realms. The observations limit what models can be made; the models do not limit what observations can be made.

When we're talking about "psi effects" or (unexplained) so-called "glitch" reports, we tend to be talking about things which fall into these gaps. In fact, pretty much all of everyday life falls into this gap (despite bluster to the contrary), due to the consciousness issue.

EDIT: your mileage may vary... ;-)

"Are intentions really acting at a distance in the present, or are they actually leading us to collapse wave functions at a future scene of confirmation."

I like the idea of "scenes of confirmation"! It relates a little to how I think of my perceptual field right now as the only "definite fact". This leads to a couple of ideas:

- Reality builds up and stabilises by Observation Accumulation. Each observed "fact" further defines the world.
- It follows that there is only one law and that is The Law of Coherence.
- New spontaneous observations are always consistent with previous observations.
- The apparent world is always coherent - which is to say that the current fact and the previously active facts will "make sense" as a single pattern.
- If one could force a new observation which defines a new fact, then the world-pattern would in effect be shifted to a new state. All subsequent observations would be consistent with that new state. This would be independent of time.

This last point means that we can selectively define or perhaps even re-define the world, budging it from its previous trajectory. "PK and psychic healing" would be just such "intervention events" where we assert new facts into the world.

If even one glitch report is true, there is something going on here that we don't yet understand.

Agreed. I say... no mechanism (as in it isn't made from "parts" and so can't be observed) and we'll never be able to describe it as a structured model, because we won't be able to bridge the gap between "inner" process and "external" result. The reason for that is that, from a subjective perspective, there is only inner processes. All experience occurs in the mind. It is that overlap, that sharing of the same space, which is the key to it. The "way it works" will be dependent upon the "mind-formatting" of the subject, which is to say the metaphor that they are adopting at the time. The only way to tackle it would be to have a model of consciousness. However, I don't believe that to be possible - since it's "that which experience is made from". It's the material of both inner and outer. It can become parts but it is not itself partitioned or located. The so-called mechanism behind ESP/PK/Healing will turn out to be, in effect, acts of directed imagination but, importantly, acts directed into the same mental space as our experience of the world, rather than the parallel space where we "think about" things.

Or pray about things, perhaps.

Yeah, indeed. That's basically imagining it, right? If you pay attention to what you're actually doing when praying. When you pray for something, you're bringing to mind that - or imagining-that - some sort of entity is making something happen. Meanwhile, if you are "using your mind-powers", you're imagining-that "you" are making something happen. It might be easier to commit fully to one or the other, depending on your beliefs.

Probably. Though it is easier to say to someone that "I am praying for your health" than "I am imagining that I am making a positive contribution for your health," At least for me, anyway. :D Though of course I know what it is that I am doing.

Haha! "Hey, I'm imagining that I'm contributing to your wellbeing!". "Um, well thanks darling, but why don't you maybe actually do it? Thanks." :)

POST: [THEORY] How would you know if you switched dimensions?

Well, surely "Jumping Dimensions" is just a metaphor for describing discontinuous change in one part of your experience relative to another part? Basically, that your personal-sensory-experience doesn't match your personal-memory-experience. You can theorise about whether the world changed, you jumped worlds, or your memory changed - but all of those are basically fictional concepts in any case.

- There is no "world" other than your experiencing of it.
- There is no "memory" other than your experiencing of it.

Both are experiences that you have now. When they stop matching up, you could call it "switching dimensions", but really that's just an explanatory fiction. Nobody has ever seen a "dimension".

Q1: A dimension isn't a place you go. It's a mathematical index used to parameterize a particle.

To be fair, I think that in this case "dimension" is meant in the sense of a location in a configuration space, where each position would correspond to a particular "world-state" - or a variation on the more colloquial use of "dimension", meaning a "realm" which is in such a state.

Q2: I'm not trying to be cute. I'm simply using physics terminology accurately instead of throwing sci fi terms around.

Don't be so tedious: "dimension" is a word with many uses, generally meaning something like "measured aspect", and predates modern physics and mathematics. Like "theory", it has a specific use in certain subject areas, which is narrower than its general use. This ill-informed pedantry causes lots of problems besides simply annoying people. For instance, it leads to the mistaken idea that the "time and space" of physical theories are directly equivalent to the "time and space" of subjective experience. It's usually folks who have smug "science enthusiasm" but have never read any of the corresponding philosophy or metaphysics who make these errors, though.

I see the utility in philosophy, unlike many of my fellow physics people.

Glad to hear it! :-)

I really think that without being conscious of the philosophy implicit in our theories (and there always is one), we are doomed to be in effect ignorant philosophers. (I'm with the other George on this.) In particular, it can lead us to confuse "conceptual coherence" - the self-consistency of a framework - with the "truth" of a situation.

There is no difference between the subjective time and space and the time and space manifolds.

I heartily disagree. I've never experienced a spatial dimension, although I have inferred one from a measurement. And I have definitely never experienced a temporal dimension. I have however experienced thinking-about those things during an experience.

A dimension in physics is a well established thing.

For sure - well, actually it has many different context-dependent meanings - but it's pretty obvious that here it is meant more in the sense of "realm" or "world" rather than geometric dimensionality, right?

Although I'd certainly agree that if terminology is used to imply a connection to physics incorrectly, it should be pointed out (e.g. everything being a "quantum" this or that), the reverse - the restriction of certain words simply because they are also used, more narrowly, in the sciences - is just as dubious a trend.

I favour the term 'world-line'. It's a bit vague, but in terms of conveying the concept of moving from one universe to another, I think it's conceptually appropriate.

"World-line", okay similar.

Elsewhere, I've been using "world-pattern". This consists of the now pattern which includes the bright unfolding shapes of present sensory experience, plus the dimmed shapes that we call "the past" and "the future", and the shapes we call "thought" and so on. All as part of one single interconnected pattern. (There is nothing outside of this pattern; the formattings we call "time" and "space" are patterns within this.)

The only rule of the world-pattern is:

- The world-pattern is always self-consistent, since it is a single coherent pattern. The world always "makes sense" overall.

If a change is made to the world-pattern, this rule means that:

- All subsequent observations will be consistent with the new state of the world-pattern.
- Changing one part of the world-pattern may "tug" upon other parts. If one fact is changed, other apparently unrelated facts may change. This includes the apparent past (which is just a present part of the world-pattern).
- The only evidence of a state change may be the personal memory of the observer.

What we call "changing dimensions" is really changing this "world-pattern" such that knock-on effects are observed. This results in an experience that feels like we have shifted to another world with different facts and a different history.

The fact that you move in 3-space and have a temporal displacement in time and can observe increasing entropy in various systems means you're moving forward in time.

That's rather begging the question, isn't it? Those concepts are certainly useful for creating a description of particular measurements within experience, but they are not the experience themselves, or "the nature of things". In particular, it's not at all clear in what sense I am located in time or how I can move forward in it. Note, I'm not saying there's no value in self-consistent descriptive frameworks (they're incredibly useful), however you can't claim truth by promoting one part of the framework by referring to another. In other words, no description is fundamental; the world is not "made from" spatial dimension and time. (I'm getting Kantian here.) So to restrict our descriptions and language to a certain set of concepts, albeit useful in certain contexts, is an error.

This entire thread is precipitated upon the (false) idea that you can travel between dimensions.

In what way is it false?

Only if you restrict the word "dimension" to its narrow use of (x,y,z,t,etc) rather than its other meanings. Which is akin to dismissing all uses of the word "colour" unless they refer to the (R,G,B) gamut.

Why is that not a cause to use terminology correctly?

Because it's wouldn't be correct use of the terminology; we're not talking physics or mathematics here. I think I said this elsewhere, but it's not using "dimension" in the sense of length, breadth, height, time. It's using it in the accepted sense of "world" or "realm" or "reality" or "another dimension" (literature sense), although it could be formulated metaphorically as a configuration space in another descriptive scheme. I mean: you understand what is meant, right?

POST: [THEORY] Shared Fading Reality Theory for Mandela Effect - Not Quantum Shift

I like the phrasing of "fading" reality. But then I'm biased, because I love the "world as memory" and "experience as associative recall" way of thinking about these things!

So something like:

- The facts-of-the-world aren't inherently stable because they are not bound to some solid substrate.
- They are perhaps (in effect) shifted by the behaviour of people, by what their behaviour implies is true.
- Previous facts-of-the-world can be forgotten through neglect, and replaced by new assertions or assumptions.

The extra rule is: The world-state must always be self-consistent, so if a fact drifts then from that point on all future experiences will be consistent with that new state. Only personal memories may remain.

POST: Am I the only one who has had a dream about something that happened in the near future afterwards?

Ian Wilson's little (free) book on his research is worth a peek: The Theory of Precognitive Dreams [http://www.youaredreaming.org/assets/pdf/Theory_Of_Precognitive_Dreams.pdf]. He also has made a few posts here and over at /r/dreams under /u/Ian_a_wilson.

/u/Ian_a_wilson: Thanks TriumphantGeorge, I did an AMA recently in /r/dreams on this topic. [https://www.reddit.com/r/Dreams/comments/3e82bm/my_name_is_ian_a_wilson_dream_explorer_and_this/] Lots of posters who have the experiences commenting in the thread.

Really enjoyed your AMA and also the discussion in the other post. It's great to see conversations which are about exploring a topic and presenting ideas as clearly as possible, rather than winning an argument. Although you partially cover this, I wonder if you could give me a snappy summary of your view on one question:

- What do you see as the relationship between these three aspects of our experience: waking experience, dreaming experience, and thoughts?

/u/Ian_a_wilson: Our waking experiences and dream experiences are parts of a much larger reality system and precognition reveals that there is a dualism between the dream expeirence and the waking expeirence where the waking experience itself is a type of dream world in the literal sense of the word but has a more complex rule-set so to speak to ensure it behaves how we all experience it. But a dream none-the-less. Thought is more than just our inner monologue that we have when awake and ties into how we think relative to content. For example day dreaming is a different way to think. Dreaming is another form of thinking. Thought is capable of programming a reality interface by which we interact with. A dream is an example of what this interface looks like, and how thought describes the dream content much like how computer code

would describe a 3D simulated game world. It is all part of language and communication between our individualized waking self and a unified field or collective which embodies the whole reality system et al. It is through this mechanism of organized thoughts forming communication and shaping dream experiences that we see a creative process where we are contributing not only to our dream content but our waking experiences albiet unconsciously for the most part.

Yes, I agree with the idea of different types of thought. When talking of it being a programming mechanism, I'm not too sure. I think it's perhaps more direct than that (although it's perhaps nitpicking with metaphor to say so). But it's definitely the way to go. The niggle I had was: why should the waking world be considered special?

So, following some experiments with synchronicity and more dramatic types of change, I've been playing with the view that all experiences are thought/imagination, and all that's special about waking life is that it's a very stable 3D-immersive thought. Other thoughts tend to be localised in mental space and transitional; waking life is a thought that has become stabilised and fills up our mental space, it localises us and the scene surrounds us. It has become a thought "about" being-a-person-in-a-particular-world - which really means it "is" being-a-person-in-a-particular-world. (When we experiment with direct-entry lucid dreaming, that process of the 2D-thought "snapping into place" as an immersive environment seems to have the same quality?)

This would mean that we don't have to talk about communication between things, between me and the world through some sort of conduit or mechanism. To create a thought "about" the world is to interact directly with the world. And any other thoughts belong to their own little world-spaces, although some of those worlds we create might be very small indeed. So we'd have that passing thoughts are simply aspects of the current state of the world flickering by; whereas intended thought is an amendment of that state.

This would imply that all time exists at once for any particular world as a sort of "world-pattern". If I change nothing, a particular future is already existing, and my "world-thought" will unfold spontaneously towards that. If I change something by intending change now, or intending change in the future, then I shift the whole world accordingly. Hence being able to have precognitive dreams (really: directly accessing that part of the "world-pattern") and updating them (really: directly updating the "world-pattern"). This also means that the passage of time belongs to the experienter, not the world.

The main issue we end up with - in my view definitely, in your view implicitly - regards the dreamer-thinker themselves. If the world is a dream, then nothing we experience in the dream can be the dreamer or the mechanism of dreaming (if indeed there need be a mechanism). For instance, we might dream that we have brains, but those dream-brains can't be what we actually are. So how are we to view ourselves?

/u/lan_a_wilson: I take the programming mechanism as a metaphor as the role of information processing (thinking) seems similar to how computers process and simulate Cartesian 3D geometry. It's all part of our thought process however which invokes our ability to dream, and the end result of what those dreams are. As you say, the Waking world is an immersed stable 3D thought. Much more organized and constrained to have consistency, chronological order and almost "genre" specific in how it delivers experiences to the participants. The Lucid Dream which acts like another interface to other reality experiences simply extends us into more creative patterns of experiences. I always view that the experience is real, however the content may not be objective or relative to the waking world. Still relative to the subject having the dream. I agree that as information past/present/future already exist much like how the World of Warcraft exists as information. In our system, there are those tangents of probability which if left alone we course through on auto-pilot but once we engage them and spike change in the probability those qualities cause new probabilities to emerge in the time-line trajectories. Hence as you say the precognitive experiences emerge and we can interface with that information through lucid dreaming and invoke change at run-time. I agree with the updating the world pattern. The world is information, the datastream of thought we interact with and render is what gives us our experience with that information. We are not the body, nor the brain. They are merely interfaces enabling the feedback and rendering of the datastream describing content. We are much much more than these "rendered" artefacts of organized information patterns. It's a good question on how to view our self as we inherit the personality and avatar of a human in the human experience but what we really are is that and more. What is our true self in this? It's astronomical like an awareness fractal branching out into a multi-dimensional informational dataset defining itself through the dreams it has. Lot's of great points and thoughts as always.

I like the notion of a "genre-specific" strand of thought!

So, I think my problem with the metaphor is that it implies that the world needs to be "run" or "processed" or "rendered" by some mechanism, and I don't find evidence for that to be true in experience. Strictly speaking, we can't say that the brain or body do this, since these are things within our experience. For instance, our experience might be "as if" we have eyes that are the source of vision and colour, but that does not mean eyes are the source of vision and colour - see dreams. The same argument applies to brains. How to avoid a potential misstep, remain true to direct experience, and have some sort of sense of the "true self"? Your "awareness branching out into a multi-dimensional informational dataset" is a nice image that points the way.

I would avoid the need for mechanism by introducing a nondualist angle. If what we are is an "open awareness" and the world is a static information set of "all possible experiences" which are already dissolved into that awareness, then we simplify things:

Ongoing experience is like us shifting our shape to reveal individual moments, like an origami paper game [<https://dreamalittlebigger.com/wp-content/uploads/2013/08/fortuneteller-animation-dre.gif>], or an evolving filter which lets different patterns become more prevalent, like constellations brightening [https://64.media.tumblr.com/5619757016199f1a1afb9c40ab366f6a/tumblr_npuk11cUST1tqp1d2o1_500.gif]. In both cases, the information set and the awareness are one thing, and the "selection mechanism" is a self-evolving emphasis rather than a processing event.

/u/lan_a_wilson: The mechanism that renders is consciousness, not a computer. This is why any time we become self-aware and self-realized be it when "physically" awake or lucid in a dream (even non-lucid) we have a reality experience. It is consciousness, and I know how ambiguous that sounds which acts as the rendering farm of information. We are literally software emulating hardware when it comes to physical reality and how this information system bound to our awareness manages experience patterns. It's all self, and the thoughts it generates which yield a myriad of experiences and I do believe it has been evolving this way beyond our concepts of space/time rather in what could very well be absolutism.

I think we're on the same page. Are you essentially saying (as I would) something like:

- All there is, is consciousness, and consciousness "takes on the shape of" both information and the transformation of information into sensory experience.

My feeling is that space and time arise-with our experiences, they are part of our sensory moments or strands of immersive thought. The world-pattern itself is static, flat, eternal but updatable, consisting of a superposition of "dimensionless facts", moments, other organising concepts. Patterns overlaid upon patterns like moire fringes. Since this leaves us with the notion that we can directly edit the "facts" of the world-pattern (via your precognitive dreams or perhaps simply though targeted imagination of other sorts), we are left to ask:

- Is the world-pattern I'm editing shared, or do we have our own copies, or some mix of the two?

(Where the "me" in that statement means the conscious perspective or agent I am, rather than the particular body sensation or whatever.)

/u/lan_a_wilson: My view of consciousness is that it's an attribute of the "self" or the being through which becomes self-aware through consciousness. That all there is, is the Self, and through consciousness it becomes self-realized. However all the creation and transformation of information into sensory forms is how consciousness plays a role in providing the feedback to the self. Answering if Reality is shared or not could invoke some sense of Solipsism as I do "believe" the following currently until disproved: At the root of all reality we find the self which has partitioned into many subjective and individualized awareness nodes. We look at our subjective individuality as an awareness node as being separate however we are in fact one unified awareness field so the pattern you are editing is shared with other parts of this unified universal self of which all of us are parts of. However if we move from the part having the experience to the whole we'll find our individualism is like an atom to a molecule, and a cell to a body. All parts of a larger whole. So is it shared? Yes but with whom? Other parts of yourself in the grand unified field. Where we are all interconnected and literally one cosmic self (hence the Solipsism when addressing the whole)... individualism when addressing it's parts. Does that mean you have to experience what all the other individualized parts are going through, no... but you do retain a thread of experience and personality that defines your role in the ongoing creative process. What we do affects other parts of this whole self. It's all interconnected.

Ah, so probably some definitions are in order, although the overall picture is similar I think. "Consciousness" is a tricky word. I've played with calling it "awareness" and so on, but there's not really a winning term. One thing I'm never quite decided on is the "creation" aspect; I'm increasingly inclined towards an "eternal" view which means creation must already be complete, it's just a shifting of attention. This has implications for the description.

Anyway - added headings to break it up a bit - apologies for length.

Consciousness As Material

I define "consciousness" as "the non-material material whose only property is being-aware". So it's the "stuff" and it is the "true self", before anything has arisen. And through taking on the shape of experience, it knows its-self (becomes conscious-of content and self-conscious if it views a part of that content as itself). You can imagine this as a blanket of material which has the property of awareness. Laid flat, it simply "is". When it ripples and folds itself then it can experience itself relative to itself. However, importantly:

- The blanket itself has no properties of "space" and "time", although those are things the blanket can shape itself into.

This image has a couple of implications:

- In this way, no experience or content is ever "the true nature" of things. There is The Truth which never changes and that is simply "being"; and there are the relative truths of the patterns which emerge in consciousness/awareness.
- All patterns and facts are dissolved into the entirety of the material, of consciousness - in much the same way as if you put blue dye into water, "blue" is everywhere and all at once. (See also David Bohm's ink droplet analogy.) These are available everywhere, all at once.
- There are no multiple consciousnesses; it is uncountable. There is simply "consciousness". This means that the idea of solipsism and individual consciousness experiences are both meaningless. It is in fact impossible to talk about the way in which "multiple" consciousness experiences exist. This is because time and space are aspects of the experience, and do not exist outside of that. There is no "space between"experiences, and there is no "time interval" between them.

In order to think about a concept, we have to divide things into parts then arrange them in mental space, because thinking is basically a "shadow-sensory" experience. The underlying reality is before such things. So here we must simply not speak.

The World-Sharing Model

However, we're not completely stuck. Personal experimentation tends to reveal aspects of both a "private view" model and a "shared world" model. I think they can be reconciled for the the purpose of daily life as follows:

- The world is not a "spatially-extended place unfolding in time". It is not a shared environment. Time and space are aspects of experiencing, not of the world.
- What the world is, is a coherent collection of all possible patterns that can be experienced. These are available everywhere-simulataneously, dissolved into the conscious space you are experiencing now.
- The world, then, is a shared resource, a toy box of patterns, rather than a "place".

So everything is the most deeply interconnected it could possibly be: there is no separation at all except as an experience. The experience you have now is that of being The Entirety, having a particular experience.

God Of The Private View

This means we end up saying stuff like: You are God of the entire universe, a private universe that you own, and it is directly under your control, to be directed and edited as you please. However, this is also true of everybody else in a "parallel-simultaneous" fashion. So probably the same description as yours, just reworded in other terms. I think the insight into the way that multiple selves are not related in time and space (or that it is meaningless to discuss it in those terms) is important though; it allows "private views" without solipsism.

The next question:

- If I am the entirety of my current experience, in what sense can I "do" anything?

Because surely any "doing" is just another experience; my actions can have no causal power. Do I not instead have to "become" the desired state, by shifting my shape? Do I need to go through the "have a dream and update it" precog process necessarily when I make amendments, if really the whole world-pattern is here right now?

Can I perhaps simply "recall" my desired state into experience, like recalling memory from the "memory-block" of all patterns dissolved into the background of consciousness?

POST: I think that I hopped dimensions and it unsettles me.

[POST]

So I'm going to contribute something to the whole "Berenst#in Bears" thing.

Okay, so a year ago my sister showed me this article. It distinctly said, "You remember them as the Berenstain Bears. But get ready for this, because they were never Berenstain at all. They were Berenstein." Naturally, we both had a good flip out moment, saying how it was weird that both of us had grown up with it being "stain". I even looked it up on Google, remembering the results spelling the creators names as "Stan and Jan Berenstein." But soon enough, we let it go. Y'know, we were wrong. It was the end of that and we moved on. Fast forward to about two weeks ago, me having long forgotten about the incident. Someone in my group chat on skype posted a link to an article, very similar to the article me and my sister had read just a year before. But something was off.

"You may remember them as the Berenstein Bears, but you'll find your mind blown when you realize that they are in fact the Berestain Bears."

...Okay, so this was mega weird. I started freaking out. I knew in my mind, distinctly, that everything was spelled "stein," when everybody was swearing that it was "stain". I know, all my life, it was stain. There was never stein, until I looked on Google that day before.

I called my sister up, and asked her if she remembered the article. Everyone was swearing it was "stein", and here I was, the only person remembering it as "stain". But my sister had agreed with me when we had talked about it before. She had agreed that "stein" was just plain weird.

But things get freaky, because when I called her to be reassured that I wasn't crazy, she came out to me with, "You're remembering wrong. We both said that it was Stein, and that Stain was wrong."

Naturally I would just assume that I was in fact remembering it wrong, but then she mentioned that we had asked mom and dad about it at the time, too.

I don't remember my dad being in that conversation. Dad had been asleep, because it was pretty late and he had gone to bed already. We had only asked my mom, who had been sitting in the recliner catching up on her show.

But no, he was there, according to my sister. Mom had been on the couch, and he had been in the recliner, and it was the afternoon when this had taken place.

...I don't remember it like my sister did. And I know that, in all my life, "stain" was right. I would have never agreed that it was "stein". And looking on Google now, of course it says Berenstain.

I really wish I had taken a screen cap back then--anything to have some kind of proof to this madness. But at the time, I just naturally assumed that I was wrong and had put it to rest, so I didn't feel the need to.

TLDR; In the Berenst#in Bears delema, I am a native from the A verse. I lived in the E verse for an undetermined amount of time, and somehow ended back up in the A verse. Me and my twin recall a certain memory regarding our reaction very differently.

[END OF POST]

There is indeed a sticky thread for "The Bears", but this post seems to be more about you and your sister having contrary experiences/memories than the actual B-topic.

Q1: Yeah, that's what I was going for...more about the fact that we remembered something totally different than the theory itself. (Although the theory IS mentioned to give a backing to my claims.)

If that's what happened, then what it suggests is: you are alone in your own trajectory, you are the only one with your particular past set of experiences.

...this comment here is just... profoundly disconcerting.

From one perspective, yes - although even in everyday terms you are confronted with something like this, that your knowledge and connection with other people is to a large extent just imaginary. However, if we get philosophical on this, there is a more hopeful approach perhaps.

If OP is alone on a trajectory throughout the parallel realities...

Well, it doesn't even need to be parallel realities as such - perhaps our lives are better thought of as filtering our way through an "infinite gloop" of potential experiences. Rather thinking of the world as a "spatially-extended place unfolding in time", what if we imagine the world as a vast collection of all possible experiences from all possible perspectives - an Infinite Grid of All Possible Moments? Instead of being "human" we become something like a conscious perspective, an experiencing space which simply "takes on the shape" of being-a-person-in-a-world. Now, initially that might make you feel very lonely indeed - until you contemplate what it means to be lonely. Loneliness is separation, it is division, it is identifying with being "here" and not being "over there". However, if the nature of our experiences are as I've just described, then there is no division. In effect, the entire world is sort of dissolved into the background right now along with the experiences of every other conscious perspective.

So on the one hand we are alone - only we will have this particular history or "trajectory across the grid". But on the other hand we are completely undivided from everyone else, and when we share experiences we share them on a much deeper, blended level than the usual "two people in a room" viewpoint.

...then can he be sure that he really 'knows', the people in his life?

The answer: He knows them absolutely intimately because if you follow this to its natural conclusion, the people he encounters are in a sense extended aspects of himself, as he is at that time. This of course would put quite a different slant on what it means to be alive. After this experience... more experiences?

Q1: Both of you bring up good points. I'll be honest, when my twin admitted to remembering everything differently, I felt pretty damn lonely. Like, 'this isn't the same twin I grew up with. This is an alternate version'. That may be far fetched to think, but I was counting on her validating my memory. So when she couldn't, and even explained an event that did not happen how I remembered it at all...it was pretty horrifying. I am 110% sure of how it went, and she is equally sure of how things happened on her end. It's just one of those memories that are so clear, I can recount the argument word-for-word.

I totally understand. But, say tomorrow you somehow remembered it the other way, the memories come flooding in, and you reply to this comment. Would you be telling me that you were now "not the OP you were yesterday"?

Surely not!

And in the same way, your sister is still the same sister, despite not apparently sharing the same past trajectory. The way I think of this is: we can view ourselves and other people as Extended Persons. Even if other people appear to change and have different experiences to us, that is still an aspect of the larger reality of that person. Part of the "set of possibilities" which constitute them. After all, I'm sure your sister's mood (and therefore apparent personality) varies quite a bit over time - and you don't declare that the different moods correspond to different people! So it is with this thing.

Q2: Bear with me (wink, wink, nod, nod)...but is it really possible for even one moment to be truly shared? No two people could possibly have the same exact experience-turned-memory because it is all processed through our individual filters. Any given two people would have different interpretations, even if it is just minutely. Looking at existence this way, we are all utterly alone without hope of a single truly shared experience. And not to be a Debbie Downer, but I have enjoyed some truly life altering moments of connection and not one of them appears to have lasted in any meaningful way as a communion between me and the one with whom I was communing. In fact, quite the opposite appears to be true: the more astoundingly, earth shatter the connection (I'm talking about telepathy and a great, soulful Knowing spanning years), the bigger the heartbreak that has resulted. Despite having been exceedingly powerful and heartbreaking, those moments and experiences have left a lasting impression on me...albeit a less dreamy one than they started out to be. If we are allowing for the theory that all "things" are connected, for a belief in unity, a singular consciousness, then despite the fireworks display of wowza connections ending up being nothing more than a splashy let down, we can quietly embrace our wholeness and recognize that we are never alone...despite this worldly experience big banging us to pieces to try and convince us otherwise. This physical experience is all about the belief in separation. The Matrix is coded for this by Unity pretending to be duality. The best it can do is pretend to be a dreamlike hologram, where time is an illusion and all effects caused by every decision "each" of us makes, in all our many lifetimes, unfolds all at once, where sometimes, we perceive the glitch. Eventually, we will wake up to realize that we are the makers of The Matrix, the cause of the glitches and even the glitches themselves. Maybe then we will be able to sit back and laugh at our incredible ability to put on one hell of a good show... and will cry over how adept we are at torturing ourselves into believing that we are all alone. I'm right there with you. Have been feeling painfully alone for a good long while, even though I "know" otherwise. I always thought of Neo meaning new, but maybe it means Knew?

Nice little essay! Of course, perhaps I was just being nice when I wrote that last comment above. :-)

Perhaps the only relationship you can ever have, is with yourself, because (in a more general sense), that's all there is. The problem with a completely intimate, total connection is that, by its very nature, it involved the dissolution of the border, the end of separation, and therefore the end of relationship. All desire is the desire to "complete", fulfilment of desire is to be completely everything...

There's something I've found useful to (here it comes) bear in mind: **after the dream... more dream.** If you have an amazing experience, it is still just an experience. All there ever is, is "existing-being" and "the current experience" (which are not divided, but for the sake of communication in language we separate them here). Experiencing never ends. If you reach total fragmentation, the next moment will be a step towards unification. If you become totally undivided, the next moment will be a step towards separation. Understanding this is all that's required; one doesn't need to do anything with it. Realising that to try and get "beyond experience" is to attempt to get beyond being-ness itself, one gives up on that and immerses oneself in the shapes one has and can take on. "There is no spoon", said The One (who thought he) Knew. What he hopefully realises is that there are no things other than the experiencing of them.

Immanuel Kant said that time and space and objects were attributes of the mind rather than some external world. The world is more an "infinite gloop" which is turn into a "place" through ongoing distinction. As you suggest, this means that we can "pretend" something and live as if it were so, and it will seem to be so - because there is no "so" other than this. Keanu Reeves was an imaginary spoon in a dream of soup!

POST: Asked myself for an answer I couldn't have known, and received the correct one.

Good story! Did you know it and then say it, or did you simply find yourself saying it?

...Nice method - grab info from your memory of a later event, then use it so that it never happens! Hmm. You were literally stealing from your own future.

EDIT: Down vote? Ah, that was meant jokily, not seriously!

...

Q3: I think you lost an opportunity there, instead of future you thinking of a random number, you should of thought of the lottery number.

Q4: She doesn't have omniscience. She only has access to what her future self would look at. Theoretically, she could only produce a future lottery number if she set herself the task of looking them up for a particular date. You should read a guy from the 1920's named JW Dunne. He had a precognitive dream where a train jumped the tracks in a small Scottish village, killing 111 people. He was so disturbed that he wrote it down. Then two weeks later, while reading the newspaper, his jaw dropped as an article recounted a tragic train accident in the same small Scottish village with 111 people killed. The thing about precognition is: You don't have omniscience. You only have access to what your future self sees. How did Dunne realize this? Well, after a few weeks it was discovered that the actual number of dead was 113. In the first reports they'd miscounted. So Dunne didn't have an objective knowledge of the accident--just what the paper said. If the paper got it wrong, his precognitive vision would be wrong, too. It was then that he realized that he only knew about it because his future self read about it in the paper. To get the lottery numbers, you'd have to know that you'd be looking up the numbers in the future. I actually experimented with it and got 4 of the 6 Powerball numbers. (I've also won the Pick-4.)

See this guy here, who also did the same experiment--with similar results: [\[http://techno-anthropology.blogspot.com/2012/02/my-story-about-lucid-dreaming-and.html\]](http://techno-anthropology.blogspot.com/2012/02/my-story-about-lucid-dreaming-and.html)
Footnote: It seems easier to breach space-time while asleep, because your mind is more at rest. Dunne theorized that "precognition," per se, is a misnomer. Because--according to physicists like Eddington and Einstein--time wasn't really linear (as we perceive it). Past, present and future are actually happened all at once. Your future self already exists. Your past self persists on another level. So, when you sleep, your mind relaxes and is able to pick up on a mix of past, present and future. In other words, it's capable of glimpsing a less-processed version of reality (as we see when we're awake).

Good on referencing Dunne there and good analysis. His work and others suggests some thoughts:

- A complete landscape of experiential moments pre-exists. Your present moment is your attention looking at one of those experiences, those moments.
- When in dream or otherwise loosened, our attention is more open and can see other parts of the landscape. (Really, it's all always there, it's just that the present moment is so much "brighter", like the daytime sun concealing the stars in the sky.)
- Precognition is therefore attention looking at other parts of the landscape.
- Extra bit 1: The landscape is not necessarily fixed. Actions in this-moment based on advance knowledge of that-moment can reshape it. For instance, acting on those lottery numbers will reformat the landscape accordingly. So precognition applies "if the current trajectory is not derailed by interference".
- Extra bit 2: Since precognitive dreaming involves "being in that future moment" to some extent, it opens the possibility of changing the event "in advance". Changing the landscape by altering that-moment rather than altering this-moment.
- Extra bit 3: This suggests that the whole "world-pattern" is always available, non-spatially and non-temporally, at all times. The entire facts-of-the-world are dissolved into the background of your conscious experience right now, and can potentially be accessed (and modified?) at any time.

Q4: The hard part (for me, at least) is becoming lucid when I dream. I utilize a technique I read about in some dream study. Basically, they discovered that your subconscious is like a film director in a movie. According to Alfred Hitchcock, "A director is like God. He is everywhere in a film, but never seen." Likewise, in this dream study, they discovered that everyone has a "director" who stages dreams; and that you can speak to "him". For instance, if you become lucid and say, "Director, can I have a harem of hot chicks," he'll actually produce them. Or: "Director, this scary monster is harassing me. Delete him." And he will. My first test came when I became briefly lucid and said, "Director, can I have the notepad in which I always write down the winning lottery numbers." And, to my astonishment, the pad appeared. My heart raced as I grabbed it and flipped it open. But, as any lucid dreamer will tell you, the adrenaline spike of excitement can wake you up instantly. And that's what happened to me. (While managing to get a few numbers, I was shunted out of the dream, before I could memorize the rest.) In the past year, I think I only became lucid 4 times. And to me that's the hardest part. Footnote: As to your other question, there's a physicist named Russell Targ, who was a founding-member of military remote viewing. (It started as a particle physics experiment at Stanford Research Institute, and went out from there.) At any rate, after decades of study, they noted that remote viewing takes place on the left side of the brain. The right side (that you try to shut down) is bad because it controls imagination. And imagination is the last thing you want to use while remote viewing. So you try to shut down the right side (as much as possible) and only view with the left side. The problem? Numbers and letters typically reside on the right side. Making number and letter recognition tricky in remote viewing. Of all their viewers, only a guy named Pat Price could do it reliably. . . . Long story short: This is why it's exceedingly hard to do it with lottery numbers. Although one remote viewer [I think it's Joe McMoneagle] uses the Pick-Four as a graduation exercise for his classes in remote viewing. To graduate you have to win it. When I won the Pick-Four, by the way, I used an old remote viewing trick. I associated numbers with celebrity ages. That way I could view a face [rather than a number, which would require the right side of my brain to kick in]. This was a waking experiment [not a sleeping one]. I just lay in bed, closed my eyes and stared into the darkness, telling my subconscious to show me a celebrity. I saw nothing for a while, and then--from out of the inky blackness--came Linda Lavin from TV's "Alice". I wrote it down on my pad and went in for another try. I then got character actor Johnny Brown [who played the maintenance man Bookman from the old TV show "Good Times".) Freaked out that my subconscious complied, I looked them up on Internet Movie Database and discovered that they were both 76 years old. I was freaked out, because I knew nothing about these actors. The fact that my subconscious knew that they were both 76 fascinated me. At any rate, that's how I assigned the first two numbers for the Pick-Four: 76. I then went in for the next two numbers, using the same technique. . . . At the risk of rambling, yes: You can do it. It just requires patience and practice. I did it multiple times. And that's the thing that cracks me up. When skeptics parrot the Amazing Randi and say, "If psychics exist, why don't they win the lottery?" The answer is: They do. You just need to stop being lazy and read. Like 86 year-old Mary Wollens, who won the lottery twice--using numbers she got from dreams. Or Stanley Bobbit. Or Robert Prodnick. Etc. So far, I've found dozens of people who got the numbers from a dream. Here's one article on it: [\[http://www.mdlottery.com/dream-leads-novice-lottery-player-to-scratch-off-win/\]](http://www.mdlottery.com/dream-leads-novice-lottery-player-to-scratch-off-win/) By the way, I brought up physicist Russell Targ for a reason (beyond his work with remote viewing). I was reading a book on his and he was talking about experiments in quantum mechanics which demonstrated that cause and effect doesn't just happen with the past affecting the present. It also happens with the future reaching back and affecting the present. I can't remember the experiment he cited, because I read it a number of years ago, but it fascinated me. Because it suggests that, yes, our future selves can reach back and help our present selves.

Excellent coverage. Coupla thoughts: On the lucid dream side, I'll pop in a recommendation for Robert Waggoner's Lucid Dreaming: Gateway to the Inner Self, which is probably the best non-beginner book out there. Philosophy, experimentation, well written. And once lucid, the logic described in a post on persistent realms in Dream Views is the best way to create things: if you can't create directly, do something that implies its creation and then see it unfold subsequently...

Relevance?

This applies to everyday living and attempting to access information: create a situation or adopt a metaphor, such that what you want logically follows from that situation or metaphor. That's what "accessing your future self" is. In fact, that's what "the future" is: a self-fulfilling prophecy about the continuance of experience. "Time" is an idea - and ideas structure experience. Your experience operates on an "as if" basis. So in a dream, if you ask The Dream Director to do something (Waggoner calls this "the awareness behind the dream"), you are implying the existence of such an entity, and then have experiences "as if" that were true: perhaps a vocal response ("I shall make it so!"), then some polite company ("well, hello there!"). But all of it is you. Not the perspective "you", but the conscious environment "you". The "awareness behind the dream" is you, dreaming of a dream perspective, in a dream environment. Then in waking life, if you ask Thor or the christian God show you a sign, again you are implying the existence of such an entity, and you may have experiences "as if" that were true also...

Q5: By the way, by sheer coincidence Reddit had a link to one of the quantum experiments I was talking about (where the future affects the present just as much as the past does). The thread is entitled: "Scientists show future events decide what happens in the past - An experiment by Australian scientists has proven that what happens to particles in the past is only decided when they are observed and measured in the future. Until such time, reality is just an abstraction." [\[http://www.digitaljournal.com/science/experiment-shows-future-events-decide-what-happens-in-the-past/article/434829\]](http://www.digitaljournal.com/science/experiment-shows-future-events-decide-what-happens-in-the-past/article/434829)

Yes, that's interesting. We discussed it a bit at /r/Glitch_in_the_Matrix recently. See it and my playful ponderings [POST: [THEORY] Scientists able to make the present determine the past]. It's not really that the observation changes the past, it's that the past never "happened" as described anyway, except as a story in our imagination. The particle/wave is an observation, it is not a thing other than that. (Is one interpretation.)

...
[COMMENT]

Q1: Any tips for how someone might do this themselves? As an experiment I tried the following:

- Open this random number generator [\[https://www.random.org/\]](https://www.random.org/).
- Decide that I will push the button soon, and understand that after I push the button, I will know what number it delivers.
- Empty my mind by focusing on the sounds in the environment around me.
- Think about my future self, and ask my future self what the number is.
- Press the button and compare to the number in my mind.
Every time, I'm way off.

[END OF COMMENT]

Great idea! Experiment time. I can't try now but suggest: don't focus on the environment, put your attention towards "the space you are looking out from". In other words, reverse your attention.

Q2: I'm on my mobile, but there's that book by one of those army guys involved in the Stargate project, and he claims it's sort of like meditation, especially with sensory deprivation. That if you let your mind drift and focus on this thing, and start just writing or describing exactly what's going through your mind without censoring yourself, that that's how it worked for him when he was able to accurately see things.

without censoring yourself

That's a really good phrasing for it.

Q3: I call that a memory echo. To me, Its a type of memory echo in which you are accessing a very specific piece of information that you don't know yet, but can know. It requires a trigger. By approaching a subject that you know (past present or future) and seeking a response or more information "now", you can get the answer from yourself since you 'technically' already know it. In this situation, the trigger was your ex boyfriend. If it's anything like what I experience on whats basically a daily basis, it's like an overwhelming feeling, and a sudden clarity driving you directly to an answer that is extremely vivid. You can feel this connection with you body and awareness, but it ends as quickly as it started. Now, this particular kind of memory echo leaves me feeling... empty is the wrong word, but kinda like discovering a secret compartment in a box, taking a single object out, and then without warning the compartment closes even if you didn't want it to, but you still have the object. This leaves me very mixed emotion wise. I'm usually prone to experiencing a strong emotion directly afterwards, especially if there is an emotion related to whatever I am accessing. I recently did this in the reverse. Someone asked me directions in a city I don't live in, or explore, so I really don't know my way around and get lost often. I had actually just asked someone if the path i was taking was correct to get to my destination. Seeing this person, and trying to access the information that I didn't have, I had a very strong sensation take me, and my mind felt 'sharp' all of a sudden. I "felt" the information and just started talking. I gave exact directions, including street names. I've never even walked near these streets before, or even seen them in a map. There is literally no way I can find that that I could have known this internally. When I finished, the "sharp" feeling stopped. I knew I just told her how to get to where she was going, but even afterwards, I still can't remember the street names. She thanked me so much, and went on her way. Something of note is that it is a lot more common for me to experience a memory echo involving people or objects, rather than text. I've "felt" entire conversations before they happened. I can actually react to this knowledge... and have done so many times over the past 2 years. What may have happened with the directions, is that it felt like I was feeling the conversation, and the resulting consequences all simultaneously for an instant, and then had access to that for the time it took me to share the information, and then it closed. It's very important to believe it will work, for it to actually work. If you feel like it isn't going to work, it absolutely will not, as that means there is no trigger present.

An alternative interpretation of this, is that it's simply the case that we can "ask for experiences" and, if we do so with conviction and get out of the way for the resulting "movement", they will happen:

- Ask for "the experience of telling this woman the correct directions", the experience arises.
- Ask for "the experience of knowing this piece of information", the experience arises.

It doesn't matter how we frame it to ourselves (as looking into the future, reading the other person's mind, or having lived it before), the essential observable is: you have an experience. Any explanation for "what happened" that we come up with afterwards is just a made-up story we create in our imagination. In fact, it operates by the same rules: we seek a plausible-ish story, and we experience coming up with one, even "knowing" it if we sought certainty...

Hmm. "Ask and receive", eh?

This does of course mean there is no "solid, spatially-extended world" beyond your immediate sensory experience - just maybe a gloop of "dimensionless facts" which are accessible (and subject to change).

...

Also: The experience you had this time seemed to be different - your experience of "the conscious open space" - and be for the first time. That addition makes it seem more "special".

POST: It was never plugged in

[POST]

So today I just bought a new alarm clock and I wanted to test it out. So I have one outlet that I know of that is behind my bed with my old alarm clock (which doubles as a radio) and my phone charger. I have a lamp next to my bed that I always use before I go to bed or when I wake up in the night because the main light switch is on the other side of the room. Anyway I decide I am going to find the outlet that the lamp is plugged into to use that one. Now I used that lamp last night and I know I used it for the past few months. I look down at the base of the lamp and I follow the cable. When I get to the end I find a dust covered cable with no outlet around it and it is just laying out on the floor. I mean the nearest outlet that isn't directly behind my bed is further then the cable would reach. Now I know I used that light but the amount of dust on it looks to be weeks worth like it hasn't been touched or moved. Something so little hasn't freaked me out this much in a long time.

[END OF POST]

Q1: This incident supports the notion in quantum physics that a potential state does not actually come into effect until it is observed. One hypothesis is that the act of observation projects our expectation onto any given phenomenon happening. In other words, at the quantum level, if we expect something to happen, then it will. If you extrapolate this to our world, there are millions of assumptions that we make about the nature of reality on a daily basis that are so ingrained that we don't even question them. What may have happened in this case is that your assumption that the lamp was plugged in was so strong, that you actually willed it into being. In other words, your expectation made it happen. Just a thought.

This is probably more of a philosophical argument than a scientific one (although the QBism interpretation does promote a sort of subjective view based on expectations). It's really the question: In what sense does an object "happen" if nobody is experiencing it? Or, does an object exist as an object when it is not being observed?

Which I guess leads to:

- Although our story about the light is that it comes from the lamp, and the lamp receives electricity from the socket, in what sense is this actually required for us to experience the light? If only the observation "happens"?
- Stories surely don't cause things to happen. So what does cause the light to happen?
- Also: Do stories "happen" in any sense other than when we are thinking about them?

Q2: I don't see how it's philosophical. In an objective reality, an effect observed at the quantum level should logically apply to all scales. Unless reality is subjective. To say that a physical property only applies to particles of which everything is comprised, but not to the amalgamation of said particles doesn't make sense.

My thinking behind that is - When it comes to experiments targeted at the quantum level, we have no insight as to the nature of the effect, only that we get results which correspond to those predicted by a mathematical theory. And without having a particular interpretation (one that can be confirmed by experiment) it's not really possible to logically scale it to other situations; there is literally no framework in which to think of it. However, we can still take on board the notion that our observations define the state of what is being observed - we just can't really talk about what is "happening" between observations. We have no theory for it and there's no way to test it scientifically. That's why I say it's more of a philosophical question.

Meanwhile - I'd say that "objective reality" is a pretty tricky concept here. When we start looking at things like the QBism (see link earlier) interpretation of quantum mechanics, it gets a little like philosophical idealism (all that exists is within mind). Rather than being a "place", the so-called objective world becomes more like a "resource", an infinite gloop of possible experiential patterns that our observations select from, thus "fixing" an aspect of our subjective world from that point onwards. (I think of this as Observation Accumulation, and the resulting persistence of prior observations as leading to a Law of Coherence.)

So we're dealing with a subjective reality (or "private copy") that is experienced, which corresponds to a subset of an objective reality (or "possibility space") which can never be experienced.

Again, since we're talking about an objective reality which by definition cannot be experienced other than by subjective observation, and therefore cannot even be thought about (since it is "before" the experience of time and space), I see it as philosophy rather than science. EDIT: Although at this level we are revealing them to be much the same thing: science = philosophy + observations.

TL;DR: We can't assume an objective reality that is of the same form as our subjective observations.

EDIT: Oops, that turned into a full manifesto. Perils of typing away in a small textbox while guzzling a caffeinated beverage. Added headings for clarity.

Logic Within Imagination

The best we can do is logically deduce the most likely reasons behind why things seem to be happening.

I think it's better to say, we deduce the most elegant description which fits in with the concepts we have developed so far - rather than being the "reason" or being "likely". This may seem pedantic, but it reminds us that we are creating connective fictions to link observations, rather than discovering "what really happens". Bearing this in mind makes it easier to remain detached and revise our models; it also keeps us mindful of the metaphorical nature of our explanations. We are dealing with "applied mental imagery" here, not reality.

Not VR. Not Probability. Not.

But the basic idea (which we haven't had the ability to comprehend until computers were invented) is that we are living in a 'virtual' reality.

This is slightly the problem, I'd say? It's the problem with our current attitude to theories in general - specifically, their reification into being their own "facts". We are not living in a "virtual reality". Nor are we living in a world governed by "probability waves". And so on. These are stories. It's not that we have been living in a virtual reality but we didn't have the ability to comprehend it until now. Rather, it's that until now we could not employ the metaphor of virtual realities when thinking about our world, because we didn't have computers and simulators. Basically, it's the modern version of universe-as-clockwork, or universe-as-geometry. (And no, the brain isn't a computer, either.)

Recent Minds, Closed Minds

I think the last 30 years of science has been the most impoverished and close-minded so far. Some of this was perhaps due to the funding crisis of the 1970s where to get finance it was very much required to "take a view" on things which were not actually verifiable (hence the rise of many-worlds and so on). This was okay, but coupled with the "gee-whiz" approach of popular science publications, scientists became more like technologists than practical philosophers, and a whole generation has grown up fighting about being right about reality, rather than being elegant about describing it. George Ellis recently made the point that "attempts to exempt speculative theories of the Universe from experimental verification undermine science", while Neils Bohr said: "It is wrong to think that the task of physics is to find out how Nature is. Physics concerns what we say about Nature." I tend to agree.

Fun Is Not Fact

None of this need be a problem necessarily, if we view our descriptions as useful or elegant or even just fun, rather than objectively true. (I'd put the simulation hypothesis and many-worlds in the "fun" category.) I think this is going to be particularly important as we are forced to discard the idea of a literal "objective world" and readmit the idea of "intersubjective agreement", something already happening in interpretations of quantum mechanics. Nitpicking? Perhaps it might seem so. But I see having the right mindset in place as essential to the healthy development of science, and even the freedom of the individual against the potential tyranny of the favoured theory of the day.

Note - this doesn't stop us enjoying playing with "the cool ideas" and seeing our lives through those lenses, but really: if you can't experience it with your senses, then it is imaginary, even though imagining such things does tend to feed back and "pattern" your experience, in a self-confirming loop of "rightitude".

TL;DR: We are not living in a virtual reality. But neither are we living in a world made of matter and energy. Supporting observations establish a particular description as being useful, not as being true.

Additional - This brief article on QM interpretations might be of interest. My own view is in line with the comments by users Romain and Anthony: "Until there is some experiment (or theory) that can distinguish between these interpretations, the question is one purely of taste, and not of scientific merit."

Your assertion that "we are not living in a virtual reality" is just as close-minded as anything else.

I mean it in a different way, though. I'm not saying that it's not a virtual reality and that it's something else. I'm saying that all content-based descriptions are "wrong" in the sense that they are relative, not fundamental. You might well be able to have experiences "as if" you are in a virtual reality, but those would be no more fundamental than having experience "as if" you were in a material world made from atoms. The fundamental truth is the nature of the experiencing itself, rather than the content of any experience or set of experiences.

Also there are subjective experiments that can be done in order to verify the true nature of reality.

Right, this is actually where I'm coming from with this...

In the end the way fundamental reality is percieved is different based upon which metaphors best make sense to us.

I certainly agree with that - although I'm wary of saying "perceived", because perception is content. I do think that most religions were attempts to present, in metaphor and parable form, the way in which the world works - no, is - on a fundamental level, beyond the specifics. Science has been more focused on the content, which is as it should be; science can't say anything about what Nature is, only what it does.

Most are just using different metaphors to describe the same thing. There is only one truth.

Agreed - a truth that can only be experienced, and cannot be put into words.

"Virtual reality" is just today's metaphor to say the same thing: that our sensory experience, now, does not correspond to how the world is actually "stored". It's like Berkeley's "mind of God", or Kant's "noumenal", or Blake's "bright sculptures of Los's Halls", or my own "Infinite Grid of All Possible Moments". Each is a metaphor for The Absolute, which is eternal and unchanging and contains all of creation. The same thing comes up in the Yogic view of consciousness (worth a read, that, for its accessible coverage of van der Leeuw and Taimni). If reality is a blanket of material, and the folds in it are our experiences (which includes thoughts) - then all these metaphors are folds which are trying to point to the material they are made from. We are the blanket, so no fold can ever encapsulate us. However, it might be able to symbolise the truth, but this symbol would only make sense as a pointer to a direct experience; it makes no relative sense.

Alternative metaphor: in a sandbox, you can only make sand-shapes which accurately represent, by duplication, other sand-shapes. You cannot make a sand-shape which accurately represents either the sandbox or sand itself.

POST: [META] Has anyone got visual evidence of their glitch story? Or have you come across a pass post with evidence supporting their glitch?

A glitch tends behave as if the world has suddenly shifted state. From that point onwards, all subsequent observations are consistent with the new state. All that remains of the previous state of the world, is the observer's own memories; there is no evidence in the world to corroborate them. (If the observer's memories had shifted state along with the rest of the world, then there would of course be no glitch.)

If you ponder it for a moment, you'll realise that even observations that are apparently "about" the past, actually arise in the present, from the current state of the world. So in a way, you could define a glitch as an incomplete shift in the world - where the whole world changes state but for some reason the observer's memory didn't, so "external" parts of experience and "internal" patterns of experience no longer correspond. This inherently means there will never be a physical record of a glitch. However, there might be a physical record of stories that were initially thought to be a glitch, and then later discovered to be something else (via that physical evidence).

POST: Potential Time Paradox

[POST]

So, just to begin, this haunts me- greatly. I am haunted by the current understanding that I could still be within this paradox and just not know it given the state of it. The experience is that of not knowing if you are coma-bound currently, and it's extremely horrid.

It all started when I was with my girlfriend at the time, I started to feel that time was passing excruciatingly slowly, comparable to that of having been set in a doctors room for so long you have no new stimulus to scan over and begin to scan over everything repeatedly for hour upon hour. These minutes felt like hours. I told her something was up, my visual snow, static of my vision, was showing very complex symmetric geometric shapes with each flash of the camera she took. I recall about 80 individual pictures being taken; flash and then no flash was the pattern. When I made note to her that time felt slow it slowly hit me that I was in a paradox... I stumbled on my own words, each time I let out the sound of the first syllable I halted myself knowing her response and went on to say the next first syllable, I was expressing each attempt with hand motions, body language, I appeared to twitch back and forth like a stereotypical robot... She got me to focus on her to say, "Everything is okay. It's all okay." I failed to believe this entirely and got up walking for the door, fear stricken remembering, "Where are you going?"

"Uh... To get water..."

"I'm coming with you."

"No it's okay." Fear swept over me knowing:

She grabbed my arm softly, "Come lay down, get some rest. We can talk about it." Walking back trying to explain the severity of the situation I stumbled on my own words, each time I let out the sound of the first syllable I halted myself knowing her response and went on to say the next first syllable, I was expressing each attempt with hand motions, body language, I appeared to twitch back and forth like a stereotypical robot... She got me to focus on her to say, "Everything is okay. It's all okay." I failed to believe this entirely...

"Everything is okay..." I said hopeful.

"It's all okay," she repeated.

"No... No!" and got up walking for the door.

Fear stricken remembering, "Where are you going?" "Uh... To get water..."

"I'm coming with you."

"No it's okay." Fear swept over me knowing:

She grabbed my arm softly, "Come lay down, get some rest. We can talk about it." Walking back trying to explain the severity of the situation I stumbled on my own words, each time I let out the sound of the first syllable I halted myself knowing her response and went on to say the next first syllable, I was expressing each attempt with hand motions, body language, I appeared to twitch back and forth like a stereotypical robot... She got me to focus on her to say, "Everything is okay. It's all okay." This slightly eased my worrying.

"Everything is okay," I repeated.

"It's all okay," she said.

"It's all okay," I repeated, calming down slightly.

"Better?"

"No... No!" I got up walking for the door.

Fear stricken remembering, "Where are you going?"

"Uh... To get water..."

"I'm coming with you."

I paused. "Okay." I opened the door and she followed, I remember the extreme feeling of relief that had swept over me as I had opened the door and time felt it wasn't flowing in slow motion.

As the story is very repetitive, I'll summarize by saying, I left the room got stuck in a loop outside of the room, reentered the room 3 times or so to get stuck in a larger loop, I even ran outside of the house just to get stuck in a loop of walking past the same cars repeatedly while only walking one lap, I remember walking directions I hadn't walked and what happened when I had walked certain directions. I got back, said the lines to a movie we watched that I had never seen before, word-for-word, which she said had never happened. We watched the movie when I realized that focusing on new stimulus and watching a digital clock halted the looping... Oh, and those pictures at the start of the story, she had only taken two and kept them all.

The following is how this effects me now, and not the story:

Presently it's all very stressful, and if I get paranoid enough I am in a loop symptoms start to show. The room I was in feels very unique, and lately I've become paranoid that I am still standing within the walls of that room simply dreaming this all. To explain, my current idea is that my brain was acting as fast as to imagine alternative timelines from within mere seconds or milliseconds, getting stuck in a loop, thus explaining the sense of time slowing down, as with boredom time seems to pass slower. I have escaped the looping thoughts and am doomed to continue on in my imagination not knowing what is real until I learn how to control it, escape, or achieve assurance I am free. My original idea was simply that I encountered too many dead-ends, remembering things that hadn't happened yet had caused me to do impossible things that caused me to loop backwards or this was sparked by similar means of my sensory not being delayed enough.

I'll try to go into further detail in comments if desired, as there is a lot more to it than this.

Delay in sensory: [<http://www.dailymail.co.uk/sciencetech/article-2542583/Scientists-record-fastest-time-human-image-takes-just-13-milliseconds.html>]

Slowing Sensory: [<http://www.telegraph.co.uk/technology/news/10697529/Prisoners-could-serve-1000-year-sentence-in-eight-hours.html>]

[END OF POST]

Sounds a bit like temporal lobe epilepsy, in which people sometimes experience odd time loops and so on, and a different sense of 'reality'. Here are some excerpts from a related blog entry on Anthony Peake's site (Peake has a theory about reality based on anecdotes of this sort of thing, which I don't agree with, but it's still interesting to ponder):

EDIT: You can read about Anthony Peake's model inspired by TLE, here [<http://www.newdawnmagazine.com/articles/cheating-the-ferryman-a-new-paradigm-of-existence>].

I have had Temporal Lobe Epilepsy since the age of 16 (I'm now 30). I underwent an operation back in November 2006 to have part of my left temporal lobe removed. I have been use in the past to a lot of things that where mentioned on your youtube video. For example when I have an petit-mal absence (which can last hours) I am literally taken over by some other part of me that has, in the past, shown knowledge and performed actions without my involvement. I also experienced exactly the same kind of time slowing down as you describe in your lecture happened to 'Margaret'. . . .

When I awoke from the operation my first words were not my own, something in me said to the doctor "What am I doing alive?". I have subsequently felt that something strange happened on that operating table. In one universe I died but in this one, and for some strange reason, I survived. . . .

I feel that the reality I see around me is an illusion - just like the Jim Carrey character discovers in the movie "The Truman Show". I had always felt this but it is even stronger since my operation. My deja vu sensations prove this to me. Last week I was watching the Everton game on TV with a group of friends. I had a weird deja vu like feeling and I told them that Everton would be beaten 2-0. It may have been coincidence (which I know it was not) but that was the correct score. . . .

feel as though I'm re-living life again but this time making the opposite decision to what I would of made in the previous life to see the outcome. All the time I keep changing the future for myself but another me follows the other path. The weird thing is I know that even if I committed suicide I would wake up again as if nothing had happened. . . .

-- Temporal Lobe Epilepsy , Deja Vu & The Daemon (Personal Experience)

Also, have you seen the "White Christmas" episode of Black Mirror, Charlie Brooker's TV series?

Q1: Thank you very much for that information. Now, oddly enough, I did feel a pressure in my brain, just within my Parietal Lobe, right hemisphere. It felt like an above moderate headache relatable to that of what I imagine having a tumor suddenly grow and apply pressure to the surrounding areas of that set location would feel like. I haven't seen either of those, sorry. However, if you are familiar with the time paradox set of episodes of The Meloncholy of Haruhi Suzumiya, it is highly relatable to that.

"On his first day of high school, Kyon meets an eccentric girl named Haruhi Suzumiya, who announces to the class that she is interested only in meeting aliens, time travelers, and espers."

She sounds like my kinda girl! Not familiar with that; sounds interesting. So, a common response to glitches here used be shouts of "seizure!" as the explanation, but in a way that's exactly what the experience you describe sounds like. I dunno, although I don't think much of Peake's theory, you might find the descriptions of experiences in his material of interest.

POST: From last week to today, work changed

If there is no physical evidence, and no one remembers either... chances are you had a very vivid dream.

Although that's also the very definition of glitch. The world shifts, all that remains is your memory. Tricky.

A glitch in the matrix is a jump or lapse in time....This one isn't really a glitch. If he had done the work and no one remembered, glitch. If someone said he did the work, but he didn't think he had yet, glitch. But someone thinking they did something they didn't do isn't a glitch.

It sounds like the guy had the full experience of it happening, and now no trace. Hmm. How do you differentiate between someone actually doing the work and the world discontinuously shifting, and them "thinking they did something they didn't do"?

The two examples you give would also be susceptible to a "dreamed it / memory problem" explanation, just in different ways?

My two examples have one verifiable aspect.

Do they? Verifiable how? In the first example he might have hallucinated/dreamed being asked to so the work, then did it. In the second example again he might just have a memory glitch where he forgot what he'd done last week. They differ from OP's example only in the extent. All three amount to: "Things aren't how I remember them to be."

Most glitches only experienced by one person can simply be attributed to memory lapse.

I'd disagree with this. We can't prove a memory lapse either, because we have no actual evidence for it. It's a non-explanation. I'd say that such glitches just can't be resolved. They are like micro Mandela Effects. We can always say "absence seizure!", but it doesn't really contribute anything.

Q1: Verifiable by ASKING colleagues and boss, as well as checking computer records. Was that not obvious to you? This particular story isn't a glitch. This is not like other stories. I know most everyone here wants to make every little thing out to be some crazy thing, but this particular story doesn't fit "glitch in the matrix". This "glitch" can be easily explained. By computer records, colleagues etc. He didn't enter some other realm here. Again, a glitch in the matrix DOES NOT simply mean "things aren't how I remembered them".

But asking colleagues and bosses doesn't verify anything in your examples.

Note - I'm not saying that OP's story means there is some sort of error in reality. His story is of the "apparently none of that happened now" type which you can't really investigate further. OP himself seems pretty convinced. Could be a minor brain twitch or anything though. Basically, we'll never know. But the same would be said of your examples:

- **"If he had done the work and no one remembered, glitch."**: So, the guy wakes up on Monday morning. He remembers being asked to do some work, exchanging emails, and doing the work. He goes into work and... He boots up the computer and all his project work is there. Great. He checks his emails but they aren't there. He talks to his boss and his boss knows nothing about the work. **Explanation:** He had a dream/hallucination sometime the previous week and imagined being asked to do the work and then did it. Not a glitch.
- **"If someone said he did the work, but he didn't think he had yet, glitch"**: So, the guy wakes up on Monday morning. He remembers being asked to do some work, exchanging emails, but not getting around to doing it. He goes into work and... He boots up the computer and all his project work is there! What? He checks his emails and they're there. He talks to his boss and his boss is really pleased with the work he did. **Explanation:** He had a dream/hallucination sometime over the weekend and imagined being asked to do the work but then not getting around to it. False memory created. Not a glitch.

In all cases we're left with OP waking up on Monday with a set of memories in his head, then going into work and finding the situation doesn't match those memories. There is no evidence that could explain things at that point. Either the world shifted, or his mind shifted, or they are the same thing - it makes no difference. Define a glitch for me.

Both of your explanations ended with "not a glitch". I thought you were arguing on the "was a glitch" side?

No, I'm just pointing out that we can always explain these things away by saying it's a hallucination, false memory, and so on - but those aren't really explanations because there's no physical evidence for them either. (Unless OP goes and gets a scan or something, but that wouldn't show anything). Glitches, I'd say, are "everyday-mode experiences that OP can't account for" and that nobody here can offer a good explanation that can be backed up by evidence. It doesn't necessarily mean that "the objective broke", although from OP's perspective his reality has glitched. How would you define them?

As far as not contributing, it contributes a heck of a lot more than "wow man crazy glitch". Asking obvious questions to determine if it was a glitch is a contribution. This story has holes all through it that asking simple questions (if answered) proves it's not an actual glitch. Sorry to burst your bubble on this one.

Sorry, to be clear: I wasn't saying that you weren't contributing (the more ideas the better). I'm suggesting that when an explanation can't be linked to evidence, we might as well just leave things open. There was a while on this sub where every story had a response of the sort "absence seizure". Which is just the same as saying "glitch". Which is to say, it isn't an explanation at all, it's just a way of saying "don't know". It's fun to think stuff up though.

POST: I was wearing a different shirt when I left the house.

Autocomplete in action!

In your absent-minded, daydreaming, distracted moment in the office, you lost track of your world and half-imagined or filled-in the usual sensation of feeling a tag at the back of your neck. But of course that sensation couldn't be there if you were wearing the black t-shirt, from which you'd removed the tag. Now, for a coherent world, current experiences must be as consistent with previous experiences as possible, otherwise the world wouldn't make logical sense. Since the most recent "observations" of reality take precedence, your "fake" observation of a tag now became the foundation of all future observations. Logically, you couldn't now be wearing the black t-shirt if you were currently experiencing having a tag. So the world had to choose between the lesser of two evils: either the t-shirt changes, or the tag suddenly vanishes while you are actually feeling it, which would be more obvious and less plausible than "maybe being confused about your t-shirt". The world basically autocompleted your tag observation into the subsequent experience of the grey, tag-possessing t-shirt. From that point on, this became the new fact-of-the-world and everything afterwards would be in alignment with it.

POST: [THEORY] The Brain is a Radio

[POST]

Hello, fine people of Glitch In The Matrix! I've been stalking this sub for quite some time now. Almost two years already, in fact. One of my biggest frustrations so far is that

there's no single simple unifying theory as to why all these glitches happen to all of us that satisfies me, aside from The Simulation Hypothesis. But the Simulation Hypothesis is boring, and takes on a very bleak view of the universe, and I prefer a different approach. So I present to you my theory, for which I have yet found a suitable name. Instead, let me call this writeup **The Brain is a Radio**.

Intro

First, a little about me. I'm a software developer by profession. In college, my focus was Computer Science so I have a general understanding of how computer systems work. Specifically, the interesting part for which my theory draws a bit of inspiration is machine intelligence (or AI). In a nutshell, machine intelligence systems work by mimicking the human brain: that is, by creating a complex network of neurons. Neurons are basically just statistical machines, which rely on numbers and statistics to produce a certain output or decision. The AI decides which action to take by weighing the individual cost (or score) of a number of actions, and choosing one which yields a preferable outcome. Then, after the action is performed, the machine "learns" if the result was productive and adjusts the action's score (minus, if the the outcome was not favorable, or positive if the outcome was good). This process is called machine learning, and the system of neurons is called an artificial neural network. Interesting jargons. With me so far?

Alright, let's take this example: the AI is tasked to learn how to cross a busy intersection and is programmed to consider two things: first, the color of the stoplight, and second, if there are any incoming vehicles. Let's say that the perfect score (100) is when the light is green, and there are no crossing vehicles; mid-score (75) if the light isn't green but there are no vehicles, same score if there is a vehicle but the light is green; and lowest score (50) if the light isn't green and there are incoming vehicles. Obviously, the AI will pick the first case, which yields the best score. If, theoretically, the AI crosses the street given that condition AND suddenly gets hit by a vehicle which it didn't see during the decision-making, it would then lower the score for that choice to say, 90. Obviously, it will still pick this one next round, and so on, until it sees a better choice. Now why is this relevant and why is this interesting? Artificial neural networks are patterned after actual neurons, that is, the fundamental units of our brain. Scientists believe that the brain works on a similar process, choosing an action for every decision and evaluating a score based on its outcome. This is how the brain experiences things, and knows whether to do something or not. This is the same fundamental reason why you don't touch a hot object, because you know that it will hurt you -- your brain has given a low score for that action.

Classical View: "The Brain is a CPU"

Any good, self-respecting scientist or neurologist would tell you that we still don't understand how the brain really works. Sure, in the past decades we've been able to identify its basic parts and we have a firmer sense of how it probably works than ever before, but no one could tell you exactly how all the pieces fit together and what all the electrical signals that the brain produces mean and where they go, or how they get processed. But, it is colloquially agreed upon that the brain acts as the central processing unit of the body -- receiving sensory information, processing and storing, and then sending out appropriate nervous responses. It is also accepted that the brain is responsible for regulating bodily functions and making sure that all the tiny bits and pieces work as they are expected, including things that you have no conscious control over (like your heartbeat, respiration, and digestion). For an even in-depth look at how we understand the brain to work, its wikipedia page is a good read. Classical science tells us that the universe works on a fixed set of laws (of which the current most accepted one is the Standard Model), and everything that we ever experience in the universe manifests through a chain of much smaller physical phenomena. This perspective tells us that we are but mere observers of these physical phenomena, that things such as time and all other sensory experiences occur at a relatively constant rate and enter our brains based on a definite set of rules. That said, why do these glitches happen and how do we experience them? After all, if the universe does work on a fixed immutable set of rules then it must be 100% certain that everybody experiences everything in the exact same fashion; but logic breaks this assumption and disproves it because of all these reported glitches (and other weird "out-of-this-world" phenomena). This very sub (and its less active sibling) is a proof of that fact. And, more importantly, why do drugs, hallucinogens, and "brain damage" cause us to experience the world in a much more different manner? Sure, doctors will tell you that these things alter the way the brain works but they can't tell you how so: and this is because of the simple yet blinding fact that we don't really understand how the brain works. History tells us that all over the world, different cultures practice using different types of drugs to induce "supernatural" effects, with shamanic tribes using herbs to alter one's personality or even show images that are supposedly impossible to be seen. How do these things occur?

My Theory: "The Brain is a Radio"

I don't claim to be an expert in quantum physics or neurobiology, in fact, I only know as much about those topics as anyone in this sub. But I've read and experienced a lot of things and have seen numerous literature that have convinced me that we are all missing something that classical science can't explain and even modern physics has not yet accounted for. This theory poses a lot of what ifs and relies on a lot of (currently) improvable assumptions, but if you give it five minutes and consider the possibilities, then you might possibly find yourself inclined to agree.

First, let's consider what quantum physics already tells us: there is an infinite number of universes out there, parallel to our own. However, our understanding of science forces us to accept that there is currently no conceivable way of accessing those alternate realities. For the purpose of this discussion, let's assume that our "alternate realities" are the Level 3 Parallel Universes detailed in the linked article. Second, let's consider the fact that our brain has a part which has been baffling scientists for so long. Right now we understand that this part secretes hormones responsible for regulating our sleep cycle in humans and most mammals, but it also exists in some other non-mammalian species containing components resembling photoelectric detectors similar to those of the eye. Weird, considering that this part is buried deep within the brain. It's interesting then to note that countless other cultures and notable men of history (including Rene Descartes) believe that this very part is the third eye, and is responsible for making us see things we know we shouldn't be seeing. Enter the Pineal Gland: "principal seat of the soul". For centuries, different civilizations have erected structures shaped after the pine cone (or as some suggest, the pineal gland itself): the Angkor Wat in Cambodia for example, exhibit pine cone-shaped rooftops, the Roman Bronze Sculpture "Pigna" is (obviously) in the shape of a pine cone, and the staff of the Egyptian Pharaoh-god Osiris bears a pine cone. For a longer writeup about some occult symbols pertaining the pine cone, you might want to take a look at this article. Of course as with anything, take it with a grain of salt, but I'm sure you'll agree that the very fact that this symbol appears all over the world, is eerie. Finally, let's try to marry those two points together. What if the brain, like a radio to a radio station, is actually just a receiver to a certain reality? And that everything that we collectively experience together in this realm is explained by the fact that our brains are tuned in to the same "frequency", if you will? If the pineal gland is actually the "antenna" or "TV aerial" of the brain, then that would explain why ancient civilizations have honored this part of the brain to be the key in unlocking the secrets of the universe and higher intelligence.

Here are some of the potential implications of that:

- Instead of thinking that drugs and other psychedelics change the way that our brains function, what if it causes the "tuning" of our brain to be offset to some other infinitesimally close frequency? That LSD, for example, does not cause us to "imagine things" but instead cause us to "see things outside our own reality."
- Glitches where people claim to have experienced an alternate reality may have unconsciously changed their brain's frequency due to stress or other physical condition. Distorted memories and "I've lived a different life" type experiences can then easily be attributed to the experienter being in the wrong frequency.
- People "seeing" things that others can't see might be unconsciously experiencing things from other realities bleeding through, perhaps again, due to their tuning being changed.
- Essentially, if we can gain conscious control of how our brain are tuned, then we can gain access to any reality that we wish. A more direct interpretation of this is that it is possible to experience any reality at will. Bending the universe to your favor is merely changing the frequency that your brain is attuned to -- because, after all, if there is an infinite number of possibilities then anything is real. Passage of time; past, future, and present are but concepts of this current reality.

So far, we've only explored the possibilities of the brain being a one-way radio. But what about a two-way radio (or a walkie-talkie)? Our brains listening and broadcasting to a single frequency? If that's the case, then this will easily explain why some people claim to have telepathic experiences and why large groups of people seem to share a collective mind.

Some Final Thoughts

This theory may answer some questions unanswerable by classical science, but still fails to address one very important question: what is consciousness? Or even what is and is there a soul?

If this is true -- that the brain is just a radio -- then is there any truth to ancient rituals and practices? That there are higher dimensions right within our grasp if only we can learn how to tune our brains to listen to the right frequencies?

Footnotes

Again, I am no expert, nor do I hold any paper for any special degree. Everything I've written is just the summary of an interpretation of the universe which I think might be possible. If you're asking me for any scientific basis, then we are misunderstanding each other. :)

If there's anything that I wasn't able to cover in my brief writeup, then feel free to ask me and I'll try my best to respond using the theory I've written. Let's discuss!

[END OF POST]

Excellent write-up. The only problem is that the "brain" you hang this on is itself part of the experience being tuned into. If I tune into the experience of being an arctic explorer, and then into being a librarian, or the same librarian in a slightly different universe, each time going to see a doctor for an MRI, I'd get different results, since I'd be (apparently) in a different body. So...

Whatever it is that does the "tuning in" must itself be beyond that which is experienced, while still being an environment in which experiences are perceived...

Something which does not itself have qualities or structure or form, but which can "take on the shape of" these things...

In other words, if you were to swap "brain" for "consciousness" and say that what happens is:

- What you truly are is an "open space of consciousness", and
- This consciousness "tunes into" or "takes on the shape of" different experiences.

Then you'd be pretty much there. And even better, you can take this beyond mere theorising: you can fairly easily prove to yourself that your actual experience right now is like an "open space" in which sensations, perceptions and thoughts arise, simply by directly attending to it. By flipping things around in this way ("the world appears within you"), the consciousness/soul problem immediately stops being an issue. Of course, the world itself now becomes essentially imaginary, distinguished from other thoughts by only its relative intensity and apparent stability.

EDIT: This got long so I've added some headings. This is a great post by the way, for starting discussion. Really pleased to have this sort of thing appearing in the sub.

To be clear, I do not think that reality is consciousness shaped within our brains. I'm saying that "consciousness" is the very stuff everything is made from. Brains are things we experience sometimes; they don't "cause" anything or shape anything.

Brains, Stations, Storage

In addition to reality, I believe that there's another station at which the brain is attuned into: a station where the brain actually stores its data including memories, knowledge, and information.

Just to ask again: **where exactly is this brain?** It can't be the body-brains we see. It can't even be within space and time, surely?

On stations: You don't need this extra invention if you have consciousness being fundamental. All there is, is patterns that are "dissolved in" the space of consciousness. Your ongoing experience is then more akin to recalling those patterns in the same way as you recall a memory. You are associatively exploring the world in the same manner that you explore a strand of thought. Since all possible experiences and information are available, things like past lives and others thoughts stop being a problem. It's all there, all the time. What you are calling a "tuning into a station" is just remembering - associatively triggering particular patterns such that they become brighter in consciousness, via "autocomplete". They are always there.

EDIT: In the same way as you can simultaneously experience the room you are "in" and also think about something, it would theoretically be possible to end up with two parallel experiences. This might lead to apparent mental health issues. Or maybe teleportation. ;-)

World As Imaginary

This is because this essentially tells you that everything around you is a product of your own consciousness, an effect of your own thinking.

The assumption you are making here is that it is "your" consciousness. Actually, consciousness is impersonal and it just happens to be having the experience of "thinking about being frankz0509 in a world".

Which means that since everything is real within your consciousness, nothing is.

This is essentially the position of many traditions - but again, with the change that it is not "your" consciousness. Nothing "is" in the sense that there is no external, inaccessible world that somehow "causes" our experiences. You are consciousness "taking on the shape of" frankz0509-in-the-world-in-this-situation.

You As Imaginary

Essentially, you are alone in the universe and everything around you is imaginary.

And you are imaginary too! ;-)

This isn't a problem really. Saying that "everything is consciousness taking on the form of experience" is no different to saying that "everything is made from atoms and brains". In fact, the former allows you to have agency and intelligence (awareness, intention, free will) whereas the latter doesn't.

EDIT: You are alone in the universe in the sense that you have your own "private view" experience, however you are not alone because you are intimately connected with all possible experience, and during your experiences you are the entire universe (effectively). The "world-sharing model" for this isn't simple to describe, because inherently it is not formatted in terms to time and space (which are aspects of experiencing and are not fundamental outside of that).

We need to be careful with the word "imaginary". It's come to be interpreted as "unimportant" or "without meaning" but really it says the opposite: everything is fundamentally meaningful. The meaning of things is actually more primary than the shape, colour, texture, etc! What we actually end up with is that instead of being alone, the experience of "being you" and everything else is intimately connected, part of one undivided conscious "material" which is "taking on the shape of" different experiences...

Direct Exploration

For this approach, you really need to go back to your actual experience without any preconceptions - e.g. George Berkeley and his Three Dialogues or in more modern times: Rupert Spira's direct attending or Douglas Harding's funny little experiments. Conscious experience becomes primary. It always is, of course, it's just that we've got in the habit of imagining it isn't, starting with a fictional picture of us being "in the world" and proceeding from there. We don't lose any of our scientific discoveries and so on by disarding this, but we do end up with a reorientation of what it means to "make observations". This switch-around is, I think, what most historical traditions are pointing at. Even things like the Biblical parables make better sense when re-interpreted as descriptions of our true relationship to experience.

TL;DR: **There is no "solid underlying" to the world; experiencing is like recalling memories;** imaginary = meaningful.

Q1: Blew my mind here. Seriously awesome post. Berkeley is a good recommendation, for sure! If you're unfamiliar with Eastern philosophy, I'd also recommend some of the philosophers from Advaita Vedanta, who have been positing ideas quite similar to this for a long, long time (though somewhat in reverse from an epistemological perspective - rather than a field of consciousness experiencing itself in various discrete beings and events, they talk about the perspective of one of these particular beings trying to remember that it IS that field of consciousness!)

Cheers!

Yes, I've delved into that side too. The same story has been retold and updated forever, it seems! And I agree with that "way round" actually, or more specifically I think they are the same thing: A conscious field shapes itself into the experience of "being a person in a world", forgets its true nature, spends a lot of time wandering around space rediscovering it is not a person but a field of consciousness - and that there is no time and space. :-)

...

Is it possible for consciousness to be hacked into...

Not sure I follow you. All experience occurs within consciousness; there is no outside. It's all arising as sensory experience within this "perceptual space". In lucid dreaming, you can have a dream about taking drugs and having all sorts of corresponding experiences. Where are the "drugs" and the "brain" in this case? What is difference between the waking version and the dreaming version of that situation?

What would be the purpose of consciousness observing itself other than to create a fictitious or faulty experience.

What purpose does there have to be? Simply enjoyment and curiosity, which is what drives most of your life (except for fear, or course). "Fictitious" and "faulty" relative to what? If there's no "outside" to experience, then there's nothing to compare it to. It's like saying something that happens on Planet Earth is "faulty". Relative to what? Relative only to a preconceived idea we might have about it.

...

Q1: In accordance to the multiverse theory, what I'm trying to propose is that the brain is tuned to a specific frequency or reality (universe). I still haven't found where the consciousness actually fits into, but that's also a good idea to explore: that the consciousness itself is the radio station. What I mean by the brain being tuned to this universe: Since there is an infinite number of universes out there, us being in this universe is merely the effect of our brains being set to listen to this universe. If for example, one day I suddenly experience seeing things that are not supposed to be; or I remember memories I have no recollection of having, then I'm suggesting that perhaps my brain has somehow been bumped into a different frequency. I'd like to believe than more than just the universe, the brain is also connected to a vastly invisible field that connects all humans and that perhaps this is where all our memories and data is stored..

Q2: Right, but if it's the brain tuning into the universe, which universe is the brain located in?

Bingo.

Q1: The brain -- the physical mass attached to body -- is attached to whatever university it is in. However the mind, or the ethereal chunk of consciousness that exists outside space-time, isn't located anywhere and is everywhere at the same time. Think of it this way: you have 1,000 radios each tuned to their own frequencies. Each radio station plays only the songs of a certain artist. Now you, the person listening, has the choice of moving around and going near whatever radio you want to listen to. All's well and good, right? Now, say I tweak one radio (re-tune it) so that it listens to a different radio station instead, and it all goes chaotic because it's not meant to listen to that frequency. You, the person in this picture = mind; radio = brain; radio station = universe. Seems pretty clear to me.

Right! I see where we differ. So to clarify, you are saying:

- person = mind = listener
- brain = radio
- universe = station

I'm suggesting the "brain=radio" bit isn't required, that it's an extra step which exists only for the analogy and can never actually be observed. We never actually experience having a brain that tunes into things. The having-a-brain thing would be part of the experience of a universe, not an intermediary. What we are left with is:

- person = mind = consciousness (an open aware space)
- consciousness "tunes into" particular experiences (forming itself into a "dream perspective")^[1]

Skipping the intermediate step, this matches with our direct experience (a conscious "space" which seems to "take on the shape" of the experience of being-a-person-in-a-world). The urge we have to fill the gap between the two steps perhaps comes from wanting to imagine a mechanism by which consciousness/mind "connects to" a universe - but that's not needed. After all, outside of experiencing it, there is no time of space, and so no mechanism or connection or material by which such a thing could be formed. The mind being unbounded and unlocated, it's actually the other way around: all possible experiences are "dissolved into" consciousness itself. All time and space is available now. Selecting an experience/universe is akin to "remembering" or "intensifying" an image from a holographic space. (A bit like an 'Imagination Room'.) What a person is, is that holographic space.

^[1] The "dream perspective" is always a 1st-person perspective, consisting of sensations, perceptions and thoughts. It cannot be accurately represented using a 3rd-person perspective model; it has no "outside".

POST: I'm still a little shaken from it. Still trying to believe it happened.

Aren't fairies and the like potentially just our own personification of the unknown, randomised mystery aspect of experience?

Q1: That's a very thought-provoking view. I'll have to mull it over a bit. Thanks. However, does it actually change our interactions with said Others?

In terms of interactions, it would depend on how far you want to push fully into the implications. If you explored it more deeply you might recognise it/them as a part of yourself and also reappraise "yourself" as being only a part of yourself - seeing both as arising as a sort of patterning of the mind, overlaid upon experience - and manage your relationship accordingly. (More deeply still, you'd perhaps see that this patterning was experience, not really overlaid upon anything.)

I've always quite liked the idea that, say, the Norse gods did for all intents and purposes literally exist. In the sense that people's experience corresponded exactly to how it would be "as if" they were actual, if that makes sense.

POST: Waking up in new realities

[POST]

I used to just chalk this up to lack of sleep and many weekends drinking past my normal limit during college. However, I cannot shake this feeling that I have woken up into similar realities that only slightly vary visually, and I dream/hallucinate of past realities. The few times this happened to me I felt as though I knew I was out of place and other people knew I was out of place.

I would talk to people I had known for ages and they would barely remember me, even though we would regularly hang out during a quarter/year. People would have varying facial features from day to day. It almost feels as if there was some sort of upgrade in facial recognition. It would weird me out that their nose could shift in centimeter increments up and down, but I wouldn't say anything because it seemed rude and crazy. Other facial features would slightly change, but it would be hard to pinpoint what had changed exactly. Eyes would change drastically though, shrinking or growing daily.

Honestly it felt like a bad drug trip everyday during this time period. And at my peak of "waking up in different realities," time would not be constant. I would be conversing with someone and suddenly the conversation would go too fast, and I would have said things I had no recollection of saying. Days would feel like hours and minutes could feel like years.

I started having vivid dreams of a world where I was unconscious in a bed being talked to by family members who have passed away and old friends I haven't seen since high school. They were semi-lucid, not in that I had control over them, but that the people in them would change back to the way in which I would remember them. They would be yelling or screaming at me about something I did or didn't do. Sounds of glass shattering, warning sirens, voices telling me to remember something. I know I am being quite

vague, but it is genuinely hard to recall, especially since I didn't really think anything of it at the time.

I used to laugh it off and tell people that I thought I was in some weird purgatory, or that time was fleeting. And every time I would make the joke they would ask me to explain, even if I had explained my experiences in detail to them before. So I just sort of stopped talking or joking about it.

I tried to keep a journal of the changes I saw, but pages seemed to always be missing. Then the journal seemed to disappear altogether one day. I would keep it table side next to my bed, but I must have just misplaced it or something.

[END OF POST]

I can't find it at the moment, but there's a short report on this subreddit where someone was pointing out that people's faces and appearance were changing quite regularly - he and a couple of his colleagues had noticed that everyone else was "shifting" periodically.

Q2: I am interested in finding people with similar experiences... But I don't know if I will even talk to them if I find them. Kind of a strange thing to bond over. I'd definitely like to read the post, if you can find it.

It was very short. Basically: "faces change in my workplace, me and two other colleagues are noticing this". Unfortunately the relevant search terms aren't very good for narrowing onto it. Will see if I can dig it out later.

Q1: I have noticed that I experience glitches far more often after a night of intense, vivid, memorable dreams. I wonder if what happens in the dream state is similar to what is theorized to happen with quantum immortality. If our consciousness spans all dimensions and realities and can slide to another string of reality if we die, then perhaps this can happen while we dream. And if so, could lucid dreaming be used to influence the reality we wake up to? After all no one really knows where we go when we die or when we're dreaming...

And if so, could lucid dreaming be used to influence the reality we wake up to?

People have experimented with this. /u/lan_a_wilson has written up his experiences with precognitive lucid dreams and making changes in them (see his write-up here and check out his AMA). Others have taken a more symbolic approach to creating change (assignment of meaning to dream objects then manipulating them).

Q2: We have always been searching for a meaning behind dreams. I wouldn't read too much into it, but it is strange that we can manipulate dreams. It certainly goes against dreams being "random" firings of the brain that is generally accepted nowadays. There is something completely non-random about dreaming. At least on an evolutionary level, there has to be some reason we dream.

Well, the particular examples in that post are of having a dream of something, deliberately changing an aspect of it, and that scenario subsequently happening in real life, with the change. Personally, I quite like the idea that our experiences can be described as A Line of Thought. The only difference between thinking about something and experiencing it, is that the experience is brighter, more stable, and 3D-immersive in comparison to a passing thought. Dreaming, then, is a switch of context - letting this strand of thought recede, and another become prominent. In that view, all thoughts and experiences would be thoughts about a large, continuous pattern which exists eternally and consists of all possible facts and experiences. Metaphorically, we could describe this as an Infinite Grid of All Possible Moments. In a precognitive dream, we would be looking at "moments" which are on our current deterministic trajectory (deterministic if we do not deliberately make a change, that is). If we alter the content of that dream, we are restructuring our trajectory accordingly.

Just some thoughts. So to speak.

Q2: Well, the brain is pretty good at making predictions, especially about its own actions. So I don't think it is too far fetched to think that a dream could be some sort of combination of predictions, wish fulfillment, and "neurogarbage."

For sure. The great thing about dreams is, really, nobody has a clue. As one sleep researcher said, after 30 years of studying it, the only thing we really know is that "dreaming is what happens when you fall asleep".

For myself, as someone interested in the nature of perception and also as a lucid dreamer, I've never encountered a persuasive and testable theory of dreams, memory or consciousness - and those things need to be solved together I think. Handwaving metaphors involving computer imagery, magical emergence, or directed evolution don't count. The question that needs answered is: how, exactly, does it account for our experience?

The reason I brought up the deliberate changing thing was because of this account, which by linking a dream directly to a future event, and the changing of the dream to the changing of the event, at least makes for an interestingly unlikely coincidence, if not more:

In 1998, one such event took place that proved the theory and, from my perspective, set in stone that the potential to actively change a precognitive dream was the next step in the logical progression of precognitive dream research and active change is achievable.

The dream offered no more than about a 5 minute window of opportunity where, when recognizing the location as a place of work (a movie theater) and a person known to work there at the time, being fully awake and aware that the current setting was in fact a dream, I targeted a co-worker -- only out of opportunity -- and caused a triangle to appear on his forehead over a distance of 6 feet.

He was behind the concession counter and I was an usher taking tickets.

At the time when I awoke, I had no idea if this lucid dream that I had mapped was in fact precognitive. The only way to know was to wait and observe if it should chronologically happen in the future.

It did.
